Within the framework of interpreting the statistically significant correlations, the study hypotheses will be verified. It is possible to speak about a moderate positive relationship between the significance for a business entity of being exempt from corporate income tax and the respondent's assessment of their company's dynamics versus its competitors: the more value they attribute to a specific preference, the higher they evaluate their own performance.

Interestingly enough, representatives of the construction business do not see a strong link between tax incentives and business performance. While admitted the value of tax incentives, they attributed their

economic success, such as sales growth and profitability, to fast-paced development, improvements to the quality of work and customer service. However, the hypothesis about various tax incentives and preferences helping to further business development proves valid for respondents who provide other services. An analysis of the effect of a trusting relationship with government on how respondents from the construction industry evaluated their business performance is presented in Table 6.

Industry: Construction	Trusting relationship has been built with government	
	Correlation coefficient	Student t-test
A land plot for construction of infrastructure facilities has been	0.655	10.87
An infrastructure facility has been built	0.507	7.37
Utility connections have been provided	0.381	5.16
Phone line and internet connections have been provided	0.265	3.44
Productivity and profitability have grown	0.385	5.22
Quality of workforce has improved	0.689	6.66
It is much easier now to hire foreign workers	0.639	6.48
Red tape has been reduced	0.488	11.75
Rental costs have decreased	0.736	5.54

Compiled by the authors

Table 6. Analysis of how trusting relationship with government impacts business performance evaluation by respondents

When assessing the achievements and complications faced by SEZ tenants in the Far East it has to be noted that building a trusting relationship with government proved to be one of the easier goals for them. There is a statistically significant correlation ($r=0.684$) between responses to the questions "Building a trusting relationship with government" (mean score 4.36) and "Reduced red tape" (mean score 3.51). This therefore means that having a trusting relationship with government resulted in reduced red tape for SEZ tenants.

The hypothesis about the requirement of filing numerous tax reports (the absence of simplified tax accounting forms for SEZ tenants) having a negative impact on tenants' business was also confirmed. Tenants mentioned an increased amount of tax reporting, while the amount of expected tax reporting and compliance requirements coincided with the amount of unscheduled reporting requirements and a heightened interest of oversight agencies, as shown in Table 7.

Questions about heightened attention of oversight agencies to the company	Correlation coefficient		Student t-test	
	Construction	Other services	Construction	Other services
Amount of expected tax reporting requests has grown	0.008	0.441	0.095	6.181
Amount of unexpected tax reporting has grown	- 0.015	0.196	0.192	2.515
Our company has experienced heightened attention of	0.277	0.518	3.606	7.613

Compiled by the authors

Table 7. Analysis of relationship between the question about building a trusting relationship with government and the question about the heightened attention of oversight agencies to the company

As part of this hypothesis it has to be noted that depending on the industry a company is in, it might be requested to file additional tax reports if its business is successful. Requests for additional reporting are more frequently faced by companies operating in the services sector (moderate and weak correlation), unlike construction where a weak negative correlation was observed between business performance and expected reporting. It is possible to speak about a certain increase in the attention that oversight agencies paid to successful businesses in both industries.

The hypothesis about the status of SEZ tenant having a negative impact on business due to heightened attention of oversight agencies proved invalid.

5 CONCLUSION

Special economic zones are an instrument of limiting government's influence on regional economies. It is extremely important, however, to have a clear development concept in place that would take into account the investor's view and be in line with the priorities of national economic policy and global trends. The analysis showed that incentives available in special economic zones constitute a unique and useful tool for facilitating business development. All respondents highlighted the significance of specific incentives, such as reduced social insurance contribution rates: SEZ tenants qualify for a reduced rate of 7.6% on annual remuneration for 10 years instead of the standard 30% rate. When asked about possible new incentives that could be introduced in special economic zones, all respondents mentioned the need for a lower tax on personal income. In order to improve the appeal of Russia's Far East for investors, factors that have an impact on the conditions of doing business in special economic zones. Further research is aimed at designing a universal approach to assessing the effectiveness of the preferences available in the special economic zones of the Far East.

THE IMPACT OF CULTURE ON RELATIONS BETWEEN PARENT COMPANIES AND FOREIGN SUBSIDIARIES

Meneses, Raquel; Carneiro, Pedro

School of Economics and Management of University of Porto, Porto, Portugal

ABSTRACT

The purpose of this research is to study the relationship between parent companies and their foreign subsidiaries, a key aspect in order to obtain a better understanding of how to manage a multicultural organization. Factors such as the autonomy of the subsidiary shape the relations between companies and it is necessary that the managers of the headquarters make the necessary adjustments to the surrounding environment. In this follow-up, we try to find out the impact of the dimensions of cultural distance on the autonomy of the subsidiaries, still little explored in this scope. Several subsidiaries were surveyed in Portugal through a research questionnaire and using hypothesis tests it is analyzed the impact of cultural distance specifically on the decision-making power of various components associated with the management of a subsidiary. The obtained results indicate that the effects of distance, although smaller than initially expected, remain significant and influence the autonomy of certain strategic decisions.

Keywords: Multinationals, subsidiaries, autonomy, cultural distance

INTRODUCTION

One of the most relevant internationalization mechanisms is the expansion of multinational companies. When the parent company has at least 50% the capital, or when there is the power to appoint and dismiss the majority of the members of the administration, it is a subsidiary company, otherwise it is called an associated company (UNCTAD, 2005). Currently, there are around 100,000 Multinationals and more than 860,000 foreign subsidiaries, numbers exponentially larger than the reality of the early 1990s, where the number of multinationals did not reach 40,000 (UNCTAD, 2017). In turn, in 2016, overseas subsidiaries accounted for about 11% of world GDP and employed more than 80 million people (UNCTAD, 2017). These values demonstrate the relevance of the study of these companies that thrive in the global market, some of them being economic agents more relevant than certain countries.

The creation of subsidiaries implies a relationship of control and coordination, central in the area of International Management and therefore the target of several analyzes, with distinct focuses over the

years (Kostova et al., 2016). The autonomy is a determining aspect in the relations between units of the same organization and greatly influences the results obtained by the Multinational. It is important to note that this variable may be influenced by several factors, from the country of origin of the multinational, or from the country of destination of the subsidiary. Although the world is increasingly globalized and geographical distance has become, seemingly, less important, other dimensions stand out, such as cultural, administrative and economic distance. For any manager is decisive to have a thorough understanding of the adjustments required to invest in a new market (Ghoshal and Nohria, 1989; Martinez and Jarillo, 1989). Therefore, the central objective of this study is to analyze how cultural distance between countries influences the management of foreign subsidiaries.

LITERATURE REVIEW

Several studies (Ginsberg and Venkatraman, 1985, Hofer, 1975, Kostova et al., 2016, Tian and Slocum, 2014) indicate that there is not an optimal strategy for the management of subsidiaries that allow having the best results in all circumstances, because these organizational decisions are, of course, dependent on the external environment (Roth and Morrison, 1990). Influenced by the level of local resources, as well as by the environmental complexity of Multinational's other subsidiaries, relations between headquarters and its subsidiaries are based on three structural elements: Centralization "corresponding to the lack of subsidiary's autonomy in decision-making"; Formalization, "allusive to the systematic use of rules and procedures in decision-making"; Normative Integration, "consensus and shared values as a basis for decision-making" (Ghoshal and Nohria, 1989, p.323).

At the organizational level, Multinationals can present two distinct models. The hierarchical structure, in which from the center all subsidiaries are monitored, is the most traditional. Symbolizes stable relations and strategic control by headquarter, however, limits the ability to manage the heterogeneity of the subsidiaries (Hedlund 1993). In this way it is thus important to use a heterarchical organization system that, on the opposite, assumes that subsidiaries are important strategic sources, that is, decision making is decentralized (Kostova et al., 2016). There are centers with different attributes and a normative control, attentive in the objectives. The heterarchical Multinational is characterized by "actively seeking advantages deriving from the company's global expansion" (Hedlund, 1986, p.20).

Autonomy

Inherent in the relation between parent company and subsidiary is the concept of autonomy, which is fundamental to its characterization. Autonomy is seen as the degree of independence available, or

acquired by a subsidiary, allowing making decisions on their own (Young and Tavares, 2004). Taggart and Hood (1999) consider it to be the result of an ongoing process of negotiation between the subsidiaries and the parent company. It should be noted that the differences between the definitions are related to the distinction proposed by

Autonomy can be seen as a synonym of decentralization, however there is a difference to be noted, which distinguishes one concept from the other. Gupta and Govindarajan (1991) define decentralization as the decision-making power that headquarters managers entrust to their branch managers. Therefore, it is explicit that decentralization refers to the attribution of autonomy by the parent company, while autonomy can also be developed by the subsidiary.

Control and coordination are two factors that can simultaneously affect the level of autonomy of a subsidiary. It may be low, as a result of the headquarters desire to maintain a comprehensive control over the activities carried out in the subsidiary, or due to the need to operate in coordination with the rest of the Multinational network (Hou (2005) cf Tong et al 2012). At the highest level of autonomy, subsidiaries have the ability to make all decisions without consulting the parent company; in the opposite scenario, all decisions are subject to headquarters approval (Tong et al., 2012).

Cultural Distance

Although the development of means of transport and communication increasingly brings geographically distant markets closer, distance remains a barrier to international trade not only through its geographical dimension but also through the cultural, administrative and economic dimension (Ghemawat, 2001). Often market attractiveness is overstated as they support their decisions in analyses models based on the sales potential such as the Country Portfolio Analysis (CPA) that uses measures such as GDP and the level of consumer income to define the ideal market . In this way, there can be an erroneous assessment by ignoring the effects associated with distance, incurring large financial losses. Each dimension can affect different firms in different ways (Ghemawat, 2001), but cultural distance seems to have a great impact.

The concept of culture is not consensual. Hofstede (1984) defines it as the collective programming of the mind that distinguishes members of one group or category of people from another, emphasizing the role of value systems as the basis for the formation of cultures. A country is by itself a collective, a group, so the study of a country's culture is decisive in order to know and understand its surroundings, as well as the opportunities and challenges that an investor may encounter.

Hofstede (1983) proposed a classification to measure the national culture, supported by a research work carried out among the employees of several worldwide subsidiaries of IBM between 1967 and 1973. He identified four cultural dimensions that distinguish employees from different countries: distance to power, individualism, masculinity and uncertainty avoidance. Later, Hofstede and Bond

(1988) added a new dimension, Confucian Dynamism, which after a rename is currently titled Long-term orientation. Finally, in 2010 a sixth dimension called indulgence was added (Hofstede et al., 2010).

The first dimension, also known as hierarchical distance, evaluates the level of inequality accepted by the people of a country, that is, the degree of centralization of authority. In societies with a great distance from power, those who do not have it are equally satisfied because they feel dependent on authority (Hofstede, 1983). Individualism contrasts the level at which people act according to self-interest, where the bonds between individuals are weak, with societies called collectivists, where the bonds are strong and all act for the good of the group. In these, the degree of integration is higher (Hofstede, 1983). The third dimension measures the prevalence of so-called masculine values such as aggressiveness, success and competitive drive, or feminine values of solidarity and quality of life. A country is considered "masculine" when there is a large division of social roles through sex and the typical masculine values dominate society. In the opposite case, when the quality of life and relations overlap with success, the country is considered "female" (Hofstede, 1983). Uncertainty avoidance is defined as the extent to which societies are willing to accept uncertainty from an unknown future. When aversion is low, people feel safe, take risks, and tolerate other people's behavior. On the other hand, in societies with a high degree of risk aversion, people tend to have higher levels of anxiety and aggressiveness, seeking regulatory institutions that increase safety. This can be created through technology, clear laws and rules and religions (Hofstede, 1983). On the other hand, the dimension that evaluates the temporal orientation refers to the way in which the investments are realized, if in the perspective of obtaining dividends in the short term, or slowly and with more care with the available resources. It differentiates in the same way societies by the predominance of norms and traditions, in contrast to those that are more pragmatic and susceptible to change (Hofstede, 2011). Finally, indulgence is complementary to the dimension of long-term or short-term orientation. It distinguishes societies in which the most basic human desires for enjoyment of life are freely gratified, so-called "indulgent", from those which impose restrictions on the satisfaction of natural needs, so-called "restrictive" (Hofstede, 2011).

The contribution of Hofstede obtained universal repercussion; however, other authors also presented proposals of classification of cultures. Hall (1976), for example, divided the cultures through the forms of communication, which could be either high context (where information is implicit) or low context (where messages are explicit). For its part, Trompenaars and Hampden-Turner (2011), Schwartz (1994) and House et al. (2004) are other examples that, inspired by the work of Hofstede, gave their contribution, presenting new cultural dimensions of country distinction.

These differences among nations demonstrate that the management of subsidiaries in different countries cannot be identical and there will never be full convergence. The dependence on cultural aspects stems from the fact that managing an organization encompasses "manipulating symbols that are meaningful to the people who are managed" (Hofstede 1983: 88). All that can be done is to understand how culture itself affects the way of thinking differently from people in other societies, and how it will influence the management strategy of a multinational organization (Hofstede, 1983). Managers should be flexible and open to new ideas, no matter how different from what they are accustomed to (House et al., 2004).

In countries where power distance is high, the ideal strategy involves greater centralization of decision-making; managers who encourage the participation of all can be seen as incompetent. On the other hand, control and integration mechanisms are more effective in cultures with high aversion to uncertainty, since there is preference for well-established rules (Hofstede, 1983; Newman and Nollen, 1996). As collaborators of more individualistic countries, being more focused on self-interest, they desire more autonomy, however, subsidiaries of collectivist countries are more likely to act in the interests of the group, and a greater sharing of acquired knowledge is expected. When the parent company comes from an individualistic culture there is a tendency to opt for greater control of its foreign affiliates. Among the so-called masculine or feminine cultures there is a greater preponderance of interdependence in the second, which is characterized by emphasizing the importance of relationships (Brock et al., 2008; Newman and Nollen, 1996).

Considering that culture only exists by comparison, Hennart (1991), cf. Richards (2000) argues that the difficulty in controlling affiliates increases with cultural distance, since the cost of communication with headquarters becomes higher. One way to get around this problem is by using expatriate managers. However, other obstacles arise because not only relations with customers, suppliers and local authorities can be damaged, but the lack of autonomy of host country managers prevents a rapid and effective response to changing local market conditions. On the other hand, greater autonomy of the local managers can give rise to conflicts of interest, hindering the coordination of the activities of the subsidiaries. It is therefore crucial to find the balance between autonomy and control of international partners (Richards, 2000).

METHODOLOGY

A research questionnaire was used, since it was considered the most appropriate method of collecting information to obtain a sample with a high number of observations.

The questions that compose the questionnaire were withdrawn, with due adaptations, from pre-existing investigations. In a first phase the questionnaire intends to draw the profile of the

multinational, parent company and subsidiary, with open-ended and multiple-choice questions. In the second part, through which we intend to measure the autonomy of the subsidiaries, based mainly on the study of Tong et al. (2012), closed-ended questions are elaborated using a 7-point Likert scale. Cultural distance was measured on the basis of Hofstede's four classic dimensions: distance to power, individualism, masculinity, and uncertainty avoidance. It was calculated the differential of the values of the countries of the parent companies compared to the values obtained by Portugal (since every subsidiaries are Portuguese) in these classifications, each being analyzed separately.

The chosen test, using the data obtained and used in this investigation was the Student-T parametric test for two independent samples. The null hypotheses are rejected when p-value is lower than the level of significance chosen, and in this investigation the hypotheses will be examined for a significance level of 5%. Before analyzing the values, it is important to take into account the Levene test to determine the homogeneity of the variances.

The samples referring to the variables "Power Distance", "Individualism", "Masculinity", and "Uncertainty Avoidance were divided into two groups through the mean value of the study values, the Hofstede classifications used the absolute values of the countries of the parent companies and not the difference with the country of the subsidiaries. Taking into account that all the subsidiaries are in Portugal, the conclusions to be drawn are identical.

RESULTS

Through the SABI database, all companies located in Portugal, active, with e-mail addresses and not listed on the stock exchange, were selected. An indicator of independence was added in order to obtain only those companies with "A registered shareholder with more than 50% direct participation", that is, taking into account the definition of subsidiary company (UNCTAD, 2005) all subsidiaries in Portugal. From a total list of 66 489 companies, one by one, were found which of them had their headquarters abroad.

Of the 2679 e-mails delivered, 157 responses were obtained, however only 100 were considered valid since the rest were not from the company management team. The number is small, but it is not surprising given that the percentage of responses to online questionnaires is below 10% (Maholtra (2007) cf Tong et al., 2012). In addition, this questionnaire was exclusively directed to the management team of the companies, which makes it difficult to obtain a large number of responses. In comparison, in the study by Tong et al. (2012), 115 valid answers were collected from a total of 2,500 questionnaires sent (4.60%), while in the present study 3.73% of valid answers were obtained.

The sample subsidiaries have their parent companies in a diverse range of countries, from all continents. This factor is important for a correct analysis of the impact of distance in relations between

companies. However, not surprisingly, there is a greater incidence in European countries, and especially in France and Spain, which together account for 41% of the sample, or in other words, are the location of 41 of the 100 subsidiaries that entered the study. The CEOs of the subsidiaries are, for the most part, from Portugal, which demonstrates the trust that the parent companies have in Portuguese managers. 34% of them have another nationality, which, together with the nationality of Marketing, Production, R & D, Finance and Human Resources staff, makes it possible to assess whether the parent companies use expatriate or non-expatriated managers. There is no newly established company, with the youngest being at least two years old. The highest incidence is 25 years, held by 10 companies. About 9 of the total sample are less than 5 years old and only 15 are over 45 years old. With respect to the sector of activity of the subsidiaries, there are companies from several areas, with more than 50% belonging to wholesale and retail trade and manufacturing, which represent 35% of the total sample. The existence of companies from different sectors also has relevance, so that the results cannot be biased by the predominance of companies of a certain industry. Finally, 33% have between 10 and 49 employees and 31% have between 50 and 249, i.e. predominant those that according to the European criterion are defined respectively as small and medium enterprises (European Commission, 2006). Fourteen of the subsidiaries are microenterprises with less than 9 employees, while the remaining twenty-two have 250 or more.

Hypothesis Testing

CULTURAL IMPACT
H1.0: The average of autonomy of subsidiaries when their headquarters is in a country with a high or reduced power distance is identical.
H2.0: The average of autonomy of the subsidiaries when their headquarters are in a more individualized or more collectivist country is identical.
H3.0: The average of autonomy of subsidiaries when their headquarters is in a country with a high or low level of masculinity is identical.
H4.0: The average of autonomy of subsidiaries when their headquarters is in a country where aversion to uncertainty is high or reduced is identical.

Table 1 - *Null hypotheses tested*

In this analysis the autonomy variable is disaggregated in nine components: (1) Human Resource management; (2) Research and Development management; (3) Finance; (4) Corporate Structure; (5) Strategic Planning; (6) Expansion for External Markets; (7) Budgeting; (8) Manufacture and (9) Marketing. The null hypotheses formulated can be seen in table 1, each of them referring to the power of decision in each of the nine divisions.

Power Distance

		Levene test for equality of variances		T-test for equality of averages		
		F	Sig.	T	Sig. (bilateral)	Difference in average
1	Equal variances assumed	0,997	0,320	0,285	0,776	0,112
	Equal variances not assumed			0,291	0,772	0,112
2	Equal variances assumed	0,324	0,570	-0,427	0,670	-0,174
	Equal variances not assumed			-0,426	0,671	-0,174
3	Equal variances assumed	1,815	0,181	-0,365	0,716	-0,129
	Equal variances not assumed			-0,375	0,709	-0,129
4	Equal variances assumed	0,000	1,000	-2,045	0,044	-0,747
	Equal variances not assumed			-2,029	0,046	-0,747
5	Equal variances assumed	0,037	0,848	0,309	0,758	0,105
	Equal variances not assumed			0,308	0,759	0,105

	Equal variances not assumed			-1,602	0,113	-0,711
9	Equal variances assumed	0,171	0,680	0,222	0,825	0,085
	Equal variances not assumed			0,221	0,825	0,085

Table 2 - Student's T-test for power distance

Starting with the "Power Distance", Table 2 shows the results of the differences in mean between the two groups in comparison.

Analyzing the T-Student test for two independent samples, it is concluded that statistically significant differences are only detected for the average of decision power of the subsidiary in the management of the Corporate Structure (4). The value of the p-value for this test is 0.046, less than 0.05, so it is possible to state that, for a 95% confidence interval, the means of autonomy of the subsidiaries by classifying distance to the power of the headquarter country are many different. When the classification is higher than 51, they have less autonomy in the management of the Corporate Structure, with a difference in the sample mean, compared to those with a lower rating of 0.747.

Individualism

		Levene Test		T-test		
		F	Sig.	T	Sig. (bilateral)	Differences in average
1	Equal variances assumed	0,274	0,602	-1,622	0,108	-0,656

	Equal variances not assumed			-0,360	0,720	-0,127
8	Equal variances assumed	0,100	0,752	-0,075	0,940	-0,036
	Equal variances not assumed			-0,074	0,941	-0,036
9	Equal variances assumed	1,857	0,176	0,417	0,678	0,165
	Equal variances not assumed			0,426	0,672	0,165

Table 3 - Student's T-test for individualism

As far as the cultural dimension of "Individualism" is concerned, it can be seen from table 3 that for both a significance level of 5%, there are no statistically significant differences between groups. Thus, the null hypotheses formulated for this dimension of the classification proposed by Hofstede are all not rejected. The level of individualism of the country of the parent company does not appear to have an impact on the autonomy of the subsidiaries.

Masculinity

		Levene Test		T-test		
		F	Sig.	T	Sig. (bilateral)	Differences in average

	Equal variances not assumed			-1,515	0,134	-0,583

Table 4 - Student's T-test for masculinity

Finding the results of the T-Student test for the impact of the "Masculinity" of the headquarter country on the autonomy of the subsidiaries, it is validated, at a significance level of 5%, that autonomy in management of Human Resources (1) is different in the subsidiaries of Multinational companies located in countries more feminine and more masculine. The sample mean is higher when the values in the Masculinity dimension are less than 46. The difference in the mean between the two samples is 0.908, as can be seen in table 4.

Uncertainty Avoidance

Table 5 - Student's T-test for uncertainty avoidance

Finally, regarding the cultural impact, analyzing the dimension of Uncertainty Avoidance corroborates the idea that, at a significance level of 5%, the decision-making power of the subsidiaries in the process of Expansion for External Markets (6) is different when its headquarter is located in countries with high or low aversion to uncertainty.

DISCUSSION

The first null hypothesis formulated - "The average of autonomy of subsidiaries when their headquarters is in a country with a high or reduced power distance is identical." - is validated for eight of the nine components under analysis. However, for a 95% confidence interval, subsidiaries with headquarter in a country with the lowest power distance have more autonomy in the Corporate Structure. This result is curious, since of the nine strategic decisions analyzed, this is the most interconnected with the distance to power, which measures the level of inequality accepted by the people of a country. Thus, parent companies in countries where this distance is accepted give less power to their subsidiaries in terms of how it will be structured, since they are accustomed to having more centralized power.

For the second dimension used to ascertain the cultural impact - "The average of autonomy of the subsidiaries when their headquarters are in a more individualized or more collectivist country is identical." - it is verified that the averages are equal in all indicators, so all null hypotheses are validated. This indicates that the level of individualism in the country of the parent company, that is, the level at which people act according to self-interest, does not influence the autonomy of the subsidiaries. This conclusion is contrary to what would be expected, since when thirst comes from an individualistic culture a trend towards greater control of its subsidiaries is expected (Brock et al., 2008).

The null hypothesis - "The average of autonomy of subsidiaries when their headquarters is in a country with a high or low level of masculinity is identical" - is rejected with respect to the management of Human Resource. For a 95% confidence interval, it is possible to affirm that there are differences in the averages, with subsidiaries based in more feminine countries having more autonomy in the management of Human Resources. These countries are characterized by emphasizing the importance of relationships, so one would expect their subsidiaries to have more autonomy (Brock et al., 2008). About Finance, with a only for a 90% confidence interval, happens the same.

Curiously, these two indicators are related to human relations and financial success, values that define the distinction between so-called masculine cultures of so-called feminine. The second is characterized by the relationships ahead of success, giving more value to the quality of life than to financial results (Hofstede, 1983). In this way, one could expect a greater autonomy in the two components in which, in fact, there were significant differences. For the remaining indicators the null hypothesis is validated.

Finally, as far as the cultural impact is concerned, the null hypothesis - The average of autonomy of subsidiaries when their headquarters is in a country where aversion to uncertainty is high or reduced is identical - is only rejected in the component concerning decision-making power of the subsidiary in the process of Expansion for External Markets. For a level of significance of 5%, it is verified that the

sample mean of this decision-making power is lower when the aversion to the uncertainty of the headquarters' country is higher.

Again, given the cultural dimension under analysis, i.e. the extent to which societies are willing to accept uncertainty (Hofstede, 1983), this impact is to be expected, especially in the decision in which it occurs. Expansion for External Markets requires a great deal of uncertainty from the unknown from a new market, so the parent companies opt for greater control of this strategic decision in order to reduce risks.

CONCLUSION

Analyzing the existing literature on the relationships formed within multinational companies and pointing out the main factors associated with them, it was concluded that autonomy is a fundamental concept inherently inherent to the management of a Multinational, serving as the basis for different studies within the area of management International. Not only the internal environment of the companies was studied, but also, and above all, the external environment. In this sequence, the effect of each cultural distance on the autonomy of the subsidiaries was studied.

The comparison with the existing and observed studies on this theme revealed significant differences in the results, which led to the rejection of the great majority of the hypotheses stated. Sometimes the effects, although significant, have opposite directions than expected. The results analyzed are, however, derived from a moderately reduced sample and specifically from Portuguese subsidiaries.

For the cultural impact, measured by the classification of the country of the headquarters in Hofstede's four classic dimensions, it was found that increasing the distance to power decreases the decision-making power in the Corporate Structure, as one might expect. The decrease in masculinity, in turn, results in more autonomy in terms of finance and human resource management, while increasing uncertainty aversion diminishes decision-making power in Expansion to External Markets. These effects have the expected direction and curiously occur only in the departments most interconnected with the definition of the cultural dimensions that evaluate them.

Through the analysis of the results, it is important to take into account the cultural in order to make the necessary adjustments to the different contexts in which the subsidiaries are inserted. Multinationals from countries most risk-averse, preferring to have greater control over their subsidiaries, may have worse results when they are internationalized for Portugal, because Portuguese subsidiaries have better results when they have more autonomy. Thus, ideal countries of origin are those that are most apt to accept uncertainty. Also, lower levels of acceptance of the distance to power in the country of the headquarter, as well as the predominance of so-called feminine values favor the correct management of Portuguese subsidiaries, with a greater preponderance so that these

hold high levels of autonomy. First of all, the option of sending the questionnaire online is justified by the ease with which information can be transmitted and a response in a very short space of time. Nevertheless, obtaining a large number of answers from companies is always problematic, but in the case of a questionnaire directed to the management team of the subsidiaries, this task becomes even more herculean, since the time available to participate in academic research is reduced. Thus, the percentage of responses obtained is not surprising; however, it is still an important limitation, since a larger sample could help in obtaining different results. As an example, a greater percentage of subsidiaries with headquarters in less developed or farthest countries of Portugal would be important for a better investigation of the impact of distance.

The criterion for measuring the variables associated with distance, although it was defined based on that evidenced in other studies, could also have been different. By way of example, several authors use the Kogut and Singh index (1988), which aggregates four dimensions proposed by Hofstede, to measure the cultural distance. However, since all the subsidiaries are from the same country, were measured, not the cultural distance itself, but the classification of the headquarters countries in each of the components. In future investigations one can try to analyze the effects of the distance supported by other measurement criteria, since by the scale used the results can be different. The focus of research rather than on the effects on the autonomy of subsidiaries could be in the knowledge flows and in the various factors that influence them.

SOCIAL ENTREPRISES' PROFITABILITY IN ITALY: RESULTS OF A STUDY ON 161 FINANCIAL STATEMENTS OVER THE FIVE-YEAR- TERM

Migliaccio, Guido¹; Molinaro, Maria Assunta^{2*}

¹University of Sannio, Department of Law, Economics, Management and Quantitative Methods (DEMM), Benevento, Italy

²Independent Researcher, Apice (Bn), Italy

ABSTRACT

The economic activity has an undeniable social relevance which becomes prevalent in some economic activities often classifiable in the so-called "third sector". There are numerous studies which analyse the "social enterprises" according to different perspectives that emphasise the social, managerial, economic aspect, etc. Obviously the internal dynamics and the outcomes of these institutions are strongly conditioned by the regulatory framework and by the economic and social reality in which they operate.

This paper presents the outcome of a comparative spatial and temporal analysis of the profitability evinced by the financial statements of 161 Italian enterprises operating in different production segments, while also distinguishing it according to their operations in the three macro-areas of the nation (North, Central and South). Roe, Roi and Ros trend has been analysed over five consecutive years (2012-2016). Contrary to the pessimistic preliminary hypothesis which considered the social objectives prevailing over the economic ones, the analysis showed a moderate average profitability of those companies belonging to the sample. Even if with physiological differences in the three macro-areas, the trend is still satisfactory. The paper is original for a methodology often ignored in bibliography. The outcomes are useful to Italian entrepreneurs and government authorities.

In the future the investigation will also have to assess the financial and patrimonial balances in order to be able to reach a more comprehensive picture. It will also have to consider the effects of the recent reform of the Italian regulations which may also lead to a different profitability.

Keywords: Italian social enterprise, Profitability, Return on equity, Return on investment, Return on sales, Balance sheet balances.

* This paper is the result of a collaborative work. However, it is possible to attribute to Maria Assunta Molinaro: "Research Methodology: Data collection and Sample Characteristics" and "Results and Discussion: Trend Analysis" with all its paragraphs. The other sections are of Guido Migliaccio.

INTRODUCTION AND PURPOSE: STRUCTURE OF THE ESSAY

The economic activity has an undeniable social relevance. There are protagonists of production which emphasise this social aspect while trying to operate in conditions of affordability that guarantee autonomy and sustainability on the long term.

All over the world, and particularly in Italy, there are productive subjects belonging to the “third sector” which presents institutions that mediate the typical characteristics of the companies of public distribution and of those for profit (Civitillo, 2016; Fici, 2018; Rivetti, 2017; Loffredo, 2018). The social enterprise is among these.

The difficult mediation between economic and social purposes induced numerous reflections about the topic, some of which emphasise, highlighting it, the social aspect (Borzaga *et al.*, 2016; Borzaga *et al.*, 2010; Pirmi and Raffini, 2016; Scarlato, 2012; Gonzales, 2010); others emphasise the managerial problems (Yang *et al.*, 2010; Sanchis-Palacio *et al.*, 2013; Meadows and Pike, 2010; Linzalone and Lerro, 2014; Bridgstock *et al.*, 2010); the organisational (Hsieh *et al.*, 2018; Nicolás-Martínez and Rubio-Bañón, 2015; Sardi *et al.*, 2019; Granados *et al.*, 2017; Zamora, 2012; Smith *et al.*, 2010) and therefore the income problems.

The crisis of 2008 has obviously, also, directly affected such enterprises, above all in consideration of the lower public resources available.

This paper focuses on the profitability of the Italian social enterprises through the analysis of financial statements, also analysing the five-year trends of three income indicators (Roe, Roi and Ros) for the whole nation and in relation to the three macro-areas into which the territory is traditionally distinguished: North, Central, South and islands. The main purpose is verifying which is the economic balance, and therefore the profitability, often subjected to the prevailing social objectives.

The preliminary hypothesis (H0) is that the social enterprise could mortify its profitability. This would compromise the durability and, in any case, an autonomous management, being submitted to public contributions. A more complete framework may occur when the subsequent economic analysis will be adequately integrated with future studies on the trend in assets over the considered period.

Consequently, the research questions to which the successive analysis responds, are the following:

RQ1: what is the situation of balance and economic imbalance in the considered period (5 consecutive years: 2012-2016)?

RQ2: are there any substantial and significant differences among the Italian macro-areas in relation to the different profitability of the social enterprises, regardless of the sector to which the belong?

In order to answer these research questions, the study carries out a quantitative analysis based on the financial statements by analysing the time trend of Roe, Roi and Ros.

The study, after explaining some evidences from international literature review, shows some data on the social enterprises in Italy. Subsequently, the methodology of the empirical research is described, it makes use of numerous balance sheets of the Italian social enterprises, distinguished according to the geographical area (North, Central and South Italy), independently from the belonging sector.

To follow, the illustration of the trends of the three aforementioned ratios.

Finally, we presented the conclusions and possible future developments of the research, also in order to answer the questions still unanswered.

LITERATURE REVIEW

International Bibliography

We must first specify that the social enterprises' model is affected by the different regulations in force in a nation. Even if with similar intentions, as a matter of fact, the civil and fiscal discipline greatly affects management dynamics. Many considerations presented by the international author, should, therefore, be contextualized in time and space.

The main writings can be divided according to the prevailing aspect treated. The social enterprise, due to its intrinsic nature, obviously lends itself to social, managerial, organizational considerations.

With reference to Italy, the beneficial effects on sociality are highlighted, first of all, by Borzaga *et al.* (2016) who remarked the advantages of collective participation for social enterprises' appearance and growth. The contribution is on the same outline of what previously highlighted in Borzaga *et al.* (2010) by testing the distributive effects of social enterprises.

The social enterprise has been considered as a valuable tool to overcome the problems of the international economic crisis, considering that it could be protagonist of a sustainable development. It is what emerges from a study by Pirni and Raffini (2016): the hypothesis is that the social enterprise represents a proactive tool for generating responses to the crisis, promoting economic and social trajectories of innovation and contributing to a sustainable developmental model. The authors specify, however, that the innovative nature of the social enterprise does not merely arise from the externalization of social services from the public to the third sector, in order to reduce public expenditure. It is characterized by a novel integration between solidarity action and economic action, in entrepreneurial practices serving a social purpose.

In Italy, moreover, the social enterprise can become a precious tool for the welfare policies, as explained by Scarlato (2012) who shows the importance of social economy in the Italian regions with regard to the welfare system and development policies. Moreover, he indicates both the institutional dynamics that could strengthen social enterprise in Italy and the potential contribution of these enterprises to the economic and human development of poorer southern regions.

The spirit of the social enterprise, in Italy, can and has to be integrated with that of the mutuality, typical of the cooperative enterprise. It is this the hypothesis of the contribution proposed by Gonzales (2010) according to which a productive institution of this type could face the two typical problems of the Italian reality that often slow down its development: parochialism and clientelism.

The importance of social and welfare dynamics of such enterprises is also highlighted by writings which consider the social enterprise as protagonist of services in the health sector. Among the others: Savio and Righetti, 1993; Millar, 2012; Fioritti *et al.*, 2014.

If we move from a socio-economic perspective to a managerial one, it is necessary, first of all, to read the contribution by Yang *et al.* (2010) which deals well with the delicate balance between economic needs and social purposes of such enterprises. The study, as a matter of fact, focuses on the management strategies and the revenue management of social enterprises to clarify how social enterprises are able to create critical social value on one hand while increasing their market value on the other hand.

The problem of the mediation between social and managerial needs is typical of all the international writings about the topic. It is also reiterated by Sanchis-Palacio *et al.* (2013) who focuses on the influence of the use of strategic tools in business performance. It is based on the consideration that the social enterprises have to be competitive in the marketplace, they must use Strategic Management tools to improve efficiency, while maintaining their effectiveness levels. With articulate arguments, it is shown the existence of a statistically significant relationship between the application of Strategic Management tools, more commonly found in for-profit organizations, and the effectiveness and efficiency of social enterprise.

The same basic principles inspire the writing by Meadows and Pike (2010) focused on performance management for social enterprises. The traditional economic-financial parameters suggested for the profit enterprises, as a matter of fact, proved to be insufficient. More useful could be the Balanced Scorecard model, conveniently adapted.

The peculiar aspects of the cooperative enterprise with social approach, in Italy, are highlighted by Linzalone and Lerro (2014).

In managerial literature it is also necessary to mention the writing by Bridgstock *et al.* (2010) which suggests the social enterprise as a privileged model for the application of diversity management's logics. It presents a relative accentuation on the organisational problems that are treated above all by other authors. First of all, Hsieh *et al.* (2018) who propose an attraction-selection-socialization model, suggesting that, to foster identification, social enterprises need to manage their hybrid organizational identities and embed the new common identity into members' daily work through attraction, selection, and socialization processes. This recent focus follows what already suggested few years earlier, by

Nicolás-Martínez and Rubio-Bañón (2015) with their study totally based on human resource management in social enterprise which has highlighted the need for workers to share a social vision of the company. Their motivation is absolutely necessary for the achievement of optimal results. The attention to the competences of social enterprises' workers is also object of the very recent study by Sardi *et al.* (2019) which also highlights the necessity of a democratic and participatory approach in performances' management.

All the scholars of company organization underline the importance of motivated workers and the need to create an environment that is fertile to develop a satisfied and productive human capital. Granados *et al.* (2017), on this outline, have developed a study on knowledge management activities in social enterprises. Zamora (2012) has even shown that such learning environment also favours the assimilation of specialized accounting problems. Smith *et al.* (2010) too, have built their outline on social enterprises and the timing of conception, focusing on organizational identity tension, management and marketing.

Therefore, the contributes related to managerial sciences devoted to the social enterprises' strategic and organisational peculiarities are numerous and articulated. Far less, instead, are those devoted to financial problems. Among them it is possible to highlight the contribution by Fedele and Miniaci (2010) who, referring to the case of social residential services in Italy, have tried to answer the question "Do social enterprises finance their investments differently from for-profit firms?".

As it is evident, there is a lack, in international literature, of quantitative studies based on the analyses of the balance sheet that focus above all on the income aspect, erroneously considered marginal. They are, as a matter of fact, the first index of a balanced management, in spite of the overriding social objectives, typical of this type of companies. This paper aims to be an example of such application.

Italian Bibliography

A necessary hint must be reserved to the wide Italian production, considering that the study proposed here refers to the financial statements of social enterprises of this nation. It must first be specified that the regulation has undergone a remarkable updating in recent years, also in order to reorganize the different figures that characterize the third sector. It is not surprising, therefore, that there is a copious production of scientific contribution, interpretative and critic of the new regulation (Castaldi, 2018; Angeli and Cinque, 2018; Fici, 2018; Felicetti, 2018; Giustolisi, 2018; Briganti, 2018; Mosco, 2018; Grumo, 2017; Di Stasio and Pasquini, 2017; Fazzi, 2017; Rondinone, 2017). In these, however, useful reflections can also be found on the influence on management regulation, considering that the discipline influences the organization of the internal controls, the statistical survey and the financial report, the taxation, etc.

In Italian bibliography too, it is possible to identify writings that highlight the political and social role of these enterprises (Bernardoni, 2017; Zandonai and Venturi, 2017; Grieco, 2013)

and others, instead, that accentuate the reflection on management and on governance (Tortia and Poledrini, 2018; Meo, 2017; Zandonai and Puccio, 2015; Ricci, 2015; Scagnelli and Corazza, 2014; Delledonne, 2014; Benevolo and Gasparre, 2013).

However, the writings that question the profile of the social enterprise and on its same persistence in the national productive panorama are prevalent, (Marocchi, 2016; Vecci, 2016; Bancone, 2016; Fontana, 2015; Manes, 2015; Fazzi, 2014; Zandonai, 2014; Stringa, 2013; Mazzullo, 2013; Randazzo and Taffari, 2013; Cannata, 2013; Scalvini, 2013).

Even in the national bibliography, however, there are not empirical researches related to economic balances deduced by these enterprises' financial statements. Obviously, this comes from the mainly social calibre which emerges, above all, from the social balance sheet and not from the classic economic - financial report (Grumo, 2017)

Nevertheless, quantitative analysis as those suggested, by integrating the knowledge of the internal dynamics, favoring the identification of possible problems which could undermine the enterprises' stability on the long term.

RESEARCH METHODOLOGY: DATA COLLECTION AND SAMPLE CHARACTERISTICS

Retaining Specifications

The data reported in this analysis have been taken from the *AIDA* database (<https://aida.bvdinfo.com/ip>). The examined sample consists of 161 enterprises. Headings have been observed and financial ratios of 5 years have been calculated: 2012, 2013, 2014, 2015 and 2016.

The companies in the sample have been divided using the geographical area of belonging as parameter, arriving to the distinction in three categories: "North", "Central" and "South". All the samples are compared with the average values of Italy.

The Northern macro-area includes: Aosta Valley, Lombardy, Piedmont, Liguria, Emilia-Romagna, Friuli Venezia Giulia, Trentino-South Tyrol and Veneto. The Central macro-area includes: Lazio, Marche, Tuscany, Umbria and Abruzzo. Finally, the Southern macro-area includes: Basilicata, Campania, Apulia, Molise, Calabria and the two islands, Sardinia and Sicily. The distribution of companies in the three macro-areas is shown in chart 1

Chart 1: N. sample companies			
Italy	North	Centre	South
161	100	27	34

Profitability ratios have been calculated in order to estimate the ability of the different management areas to generate a return on invested capital in the company. They compare the economic result with the capital used to obtain it.

RESULTS AND DISCUSSION: TREND ANALYSIS

ROE (Return on equity)

The index indicates the company's overall profitability in percentage terms. ROE is not only determined by the choices accomplished in the environment of the distinctive management, but also by the decisions regarding the financial and asset management. Its value should be as high as possible. The ROE formula is $(\text{Net Income}/\text{Net Equity}) * 100$. The data obtained is shown in chart 2 and graphically illustrated in figures 1 and 2.

Years	ITALY	NORTH	CENTRE	SOUTH
2012	6,68%	2,83%	7,46%	17,37%
2013	1,72%	2,00%	8,13%	-4,18%
2014	4,42%	3,07%	4,12%	8,63%
2015	7,27%	5,38%	18,02%	4,27%
2016	12,00%	12,84%	9,95%	11,17%

Source: our elaboration on AIDA data

ROE trend is fluctuating in the examined years. We can observe a negative value in "South" in 2013; there are growing years and years with decrease. For the sample "North" the highest value has been noticed in the last year considered, in the sample "Central" in 2015, while in the sample "South" in 2012.

The graph highlights the peaks per sample as indicated above. ROE in the sample "North" since 2013 has been constantly growing; while in the other two samples the situation is more cyclical and varied. The graph shows, moreover, that in the last year analysed, the situation is more stable and the three samples show small percentage differences, while over the other years the values of ROE differ a lot from sample to sample. The average values observed in the sample "Italy" have been constantly growing since 2014.

Another graph is proposed below to better detect the fluctuating trend.

Figure 2: Graphic Illustration of Roe trend (II).

**ROI (Return on investment)**

ROI index expresses the profitability of the sole characteristic management of the enterprise in terms of percentage. It represents the synthetic indicator of the effectiveness and efficiency with which the management and operational areas of the enterprise (purchasing, production and commercial) have been managed. For the calculation of ROI, it is essential the reclassification of the Income Statement as it is not considered the full amount of income, but only the income produced by the characteristic management, that is the management that includes all the acts that characterise the enterprise. Its optimal value must be as high as possible. The ROI formula is: $(\text{Operating Income}/\text{Invested Capital}) * 100$. The data obtained is shown in chart 3 and graphically illustrated in figure 3.

Years	ITALY	NORTH	CENTRAL	SOUTH
2012	2,63%	3,17%	1,36%	2,04%
2013	3,01%	2,76%	4,51%	2,57%
2014	2,63%	2,34%	3,72%	2,62%
2015	3,45%	3,83%	0,74%	4,47%
2016	4,31%	4,77%	2,93%	4,07%

Source: our elaboration on AIDA data

Chart 3 shows that the social enterprises in question have a positive ROI with higher values in the sample "North" and in the sample "South". As for the "Central", the highest value has been observed in 2013, while the lowest one, also in relation to the other two samples, has been observed in 2015, and then increased again in 2016.

The graph shows the values divided first by year and then by sample. It seems from this, that for the “North” there has been a reduction of ROI from 2012 to 2015, year in which a growing trend is observed. For the “Central”, the situation is more fluctuating because since 2012 ROI has been increasing, and then reducing since 2014, up until the minimum value 0,74% in 2015, and finally a growth is observed over the last year examined. In the sample “South” there has been a steady growth since 2012 that has seen a slight turnaround only in 2016.

ROS (Return on sales)

This index will express the sales’ operating profitability. It expresses the company’s operative profitability in relation to the sales made within a predefined time-frame. Basically, ROS expresses the amount of net revenue achieved for each Euro of turnover. Also in this case, the value should be as high as possible. ROS formula is: $(\text{Operating Income} / \text{Total Revenues}) * 100$. The obtained data is shown in chart 4 and graphically illustrated in figure 4.

Chart 4: ROS trend

Years	ITALY	NORTH	CENTRAL	SOUTH
2012	1,48%	1,16%	-0,48%	4,00%
2013	0,96%	0,74%	0,18%	2,25%
2014	1,81%	1,65%	0,75%	3,12%
2015	1,90%	2,03%	0,82%	2,38%
2016	2,78%	2,72%	3,02%	2,77%

Source: our elaboration on AIDA data

The chart shows that ROS is different among the various samples and also in relation to years. There is, as a matter of fact, a negative value for the “Central” in the first year analysed and then always positive values, which in the case of the “North” are almost always growing. In the case of the “South” the

values vary from year to year, but are overall the highest observed among the various samples, as also shown by the following graph. The average value observed by the sample "Italy" are always positive. From 2012 to 2013 there has been a reduction of ROS while since 2013 onwards the values have been always growing.

From the analysis carried out in this chapter, it is noticed that the *economic balance* of the analysed social enterprises, is on a sufficiently balanced average from the economic point of view. They present, as a matter of fact, an average ROE, considered overall over the 5 year-term, in the amount of a 6,42%. ROI is also very positive and amounts to an average of 3,21%. ROS is on average positive, but with a lower average value than the other two indices; it is, as a matter of fact, in the amount of 1,77%.

CONCLUSIONS AND IMPLICATIONS: LIMITATIONS AND FUTURE PERSPECTIVES

The difficult mediation among social aims and necessary economic and financial balances requires extensive quantitative analyses that are placed next to the already numerous writings on the specific connotations of the social enterprise in Italy, with peculiar connotations deriving from a recently reformed legislation.

The initial hypothesis according to which the Italian social enterprise could mortify its profitability to the benefit of prevailing social purposes has not been confirmed.

The profitability of the examined sample appears satisfactory, above all considering that it is placed next to the social and welfare role of many such companies, even if organized in a cooperative manner.

Therefore, a satisfactory picture emerges, in which the economic balance is not undermined by the social object. This suggests that such companies can develop and grow adequately over time: an adequate profitability is a logical prerequisite for durability. Obviously, such a conclusion should be confirmed by a precise analysis of the main economic items which have led to these positive results. It is necessary, rather, to verify the effect of possible public contributions to the rebalancing of the economic situation.

The territorial analysis of Italian social enterprises, as well, can induce a positive assessment, considering that the physiological differences among the macro-areas do not lead to significant differences: it seems, therefore, that similar managerial logics have a correct diffusion everywhere. This conclusion, however, cannot fail to consider that the majority of the companies in the sample belongs to the Northern Italy area where it seems that such initiatives are widely present and in any case certainly prevalent compared to the Central and the South.

Subsequent similar studies could lead us to considerate also the balance sheets and financial balance of these companies, so as to add complete conclusions in relation to the judgment that can be drawn from financial statements.

In order to obtain a complete and insightful picture of the economic and social value of this type of companies, however, might be necessary if not mandatory on top of the research conducted above, taking into consideration investigating whether social goals were effectively met. Further analyses on social statements on Italian companies would increase greatly the current state of this research considering the attention that these matters attract within the focus of the current jurisdiction (Grumo, 2017; Ricci, 2010; Costa and Ramus, 2010; Verde, 2009; Signori and Stiz, 2006; Puddu, 2005).

A deeper statistical research might ease the understanding of the existing gaps among the geographical areas studied. I.e. a comparison among clusters of companies could be done through the ANOVA method (Gu, 2013; Solari *et al.*, 2009; Strang, 1980; Ross e Willson, 2017; HackerJoel e Angiolillo-Bent, 1981; Quirk, 2012; Liao e Li, 2018) which has already proven to be effective in previous research. (Iovino e Migliaccio, 2018¹, 2018², 2019; Fusco e Migliaccio, 2016¹, 2016², 2018, 2019; Migliaccio e Fusco, 2018; Migliaccio e Arena, 2018²).

This study wanted to implement the existing bibliography, which is rarely based on quantitative analysis, favoring business cases (Yang *et al.*, 2010; Meadows and Pike, 2010; Sardi *et al.*, 2019; Hsieh *et al.*, 2018; Nicolás-Martínez and Rubio-Bañón, 2015; Zamora, 2012; Fedele and Miniaci, 2010) or qualitative cases that exploit results taken by questionnaires (Bridgstock *et al.*, 2010; Linzalone and Lerro, 2014). Due to the profound differences in the method of conduction of the study it would be useless to try and compare these results with existing publications.

It is certainly useful to evaluate the management of such companies. It can provide useful parameters for those who already work with social forms of this type and, above all, it can contribute to outline development policies both at national and regional level for these companies, increasingly useful for improving the standard of living of modern societies.

This paper and the results reached might be meaningful for research work that share a similar methodology. Equally, it might be of interest for courses dedicated to social management, with the objective of spurring new ideas and discussion on the complex equilibrium that exists between economic profitability and social responsibility.

ECONOMIC-FINANCIAL DIMENSION OF ITALIAN SOCCER TEAMS AND SPORTS RESULTS: SOME RELATIONSHIPS

Migliaccio, Guido; Corea, Martina Maria*

University of Sannio, Department of Law, Economics, Management and Quantitative Methods (Demm),
Benevento, Italy

ABSTRACT

Football is one of the most popular sports, especially in some countries like Italy. It has a remarkable social and educational importance. In recent decades, the high investments and business that characterizes this sport has highlighted the need for more careful regulation with respect to the economic and financial dynamics of each team.

This quantitative research based on the balance sheets of Italian Serie A soccer teams highlighted the patrimonial, financial and economic characteristics of the clubs divided into two groups in relation to sports results. The major teams, often placed at the top of the rankings, have lower incomes, despite higher revenues. They have a better balance of medium-long-term sources/investments but, on the other hand, they have short-term solvency risks only mitigated by better cash flow.

Further future developments of the research and an appropriate comparison with the international bibliography will allow more precise conclusions useful for the managers at the strategic level of the sector, as well as at the top of each individual company.

Keywords: Italian soccer; Financial statement; Ratios; Performance; Economic And Financial Balance.

INTRODUCTION AND PURPOSE: STRUCTURE OF THE ESSAY

Sport is a complex phenomenon in constant evolution. It is a derivative of the dominant culture of a place that, with a peculiar feedback mechanism, affects the formation of new generations, considering its great educational function (Pollo *et al.*, 2011). The social value of sport is underlined by the wide importance of mass media events and by the involvement of a large part of populations of all ages and social classes (Del Guercio and Bifulco, 2016; Benacchio, 2015; Greco, 2014).

All sports can spread values such as mutual respect and acceptance of results. Unfortunately, however, the growing economic importance assumed by different sports has gone beyond the original intentions; some sports results are considered questionable, sometimes derived from pathological phenomena

* This paper is the result of a collaborative work. However, it is possible to attribute to Martina Maria Corea: "Research Methodology: Data collection and Sample Characteristics" and "Results and Discussion" with all its paragraphs. The other sections are of Guido Migliaccio.

such as corruption, use of drugs, etc. (Becattini, 2014). The mutual influences between sport and crime have unfortunately emerged in numerous investigations, without however affecting the need for populations to abandon a sedentary lifestyle harmful to their physical and mental health.

Each country has a sport that is mainly practiced or attracts many spectators. In Europe, and in Italy in particular (Leopardi, 2006), and in South America, football has always had a prominent role since its origins, but it is now also spreading to other continents.

The history of football is very ancient (Bortolotti, 2002; Romanato, 2008). Its origins date back even to decades before Christ; more modern features appear in the mid-nineteenth century, in England. Its diffusion and the proliferation of teams made it necessary to set up national and international federations and start sporting competition in several championships.

The growing interest and the advent of the mass media (Martin *et al.*, 2015; Bromberger, 2015) has developed the social value of football (Porro, 2004; Abete, 2004; Papa and Panico, 2000) and economic interests that have attracted substantial investments in facilities and training, transforming this sport into a true "business" (Cavallito, 2012; Tirrito, 2005).

Sports associations have often turned into corporations that have had to equip themselves with an adequate accounting information system and publish the economic and financial results in their financial statements. From the balance sheets of the football clubs it became clear that the economic dynamics of the sector presented significant problems, considering that the growing revenues for tickets, television rights and sponsorship did not compensate for the increase in costs, especially of the best football players. Therefore, new legislative provisions have been introduced until reaching the current legislation that introduced, in Europe, financial fair play aimed at optimizing the economic-financial management of the clubs (Bernoldi and Sottoriva, 2011; Ghio *et al.*, 2019).

At the same time, a possible relationship emerged between the economic dimension of the teams and their sports results, up to the hypothesis that the sports results were almost exclusively the result of the investments (Howard and Crompton, 2002; Lago-Peñas and Sampaio, 2015).

The theme has been the subject of reflection all over the world and also in Italy where football is certainly the national sport with the most beautiful championship in the world.

From these brief premises we highlight the need to analyze the relationship between the economic-financial dimension of the teams and their sports results, hypothesizing that (H1) the most economically and financially solid teams are those that most easily reach better competitive results.

Therefore, the research questions are:

RQ1: What are the economic and financial balances of Italian soccer teams in the Serie A league?

RQ2: Is there a connection between sporting results and the patrimonial and economic balance of the Serie A championship teams?

To answer these questions, a quantitative analysis was developed using the balance analysis technique considered representative of internal economic dynamics, especially if compared in their time development.

The findings are, in part, surprising, even if compared with similar results that characterize the national and international bibliography, which constitutes a necessary premise to the analytical illustration of the survey and its results.

LITERATURE REVIEW

Along with a vast bibliography on the social, medical, psychological and educational aspects of sport and football, in particular (among others: Pollo *et al.*, 2011; Del Guercio and Bifulco, 2016; Benacchio, 2015; Greco, 2014; Porro, 2004; Abete, 2004; Papa and Panico, 2000), there are not many international studies about economic dynamics.

First, the research of Büch (2004) at the beginning of the millennium, which has clearly proposed a careful examination of the relationships between sport, economy and law, with attention to professional football.

A few years later, Gerrard (2006) outlines the main financial innovation in professional team sports, analyzing the case of English Premiership soccer. This paper is emblematic of a growing attention to the economic and financial problems of football teams. However, the problem had already been highlighted at least a decade earlier in North America as it correctly outlined, in 2002, the study by Howard and Crompton, about the financial status of local professional sports leagues, comparing them with the English ones. Even then, increasing annual operating losses were noted, mainly due to the high cost of players' bids.

Since the richest teams have often dominated competitions for twenty years, the problems that would have exploded later were underlined.

In recent years the problem has affected the best international doctrine with a growing number of studies.

The first publication that had the merit to argue for the necessity of regulating European club football financially, in order to create a fair structure of sporting competition was that of Storm in 2012 that develops an understanding of why the majority of European top league clubs are loss-makers and why regulation is needed. The paper's findings demand action to be taken to secure financial fair play in order to deal with issues of equal sporting competition. It argues that this must be done through a central regulation scheme covering all European leagues, thus endorsing the new UEFA financial fair play program.

In 2014, an interesting focus on Brazilian football teams was proposed by Proni and Zaia. The authors outline the situation after about 15 years since the launch of “Lei Pelé” in 1998, which began the transition to corporate management of soccer clubs. This essay looks back at this modernization process while analysing the clubs' results and their financial ratios with the aim of understanding their main difficulties and how successful they have been in trying to modernize.

Subsequently, the more complete study is published about the relations between economic and financial dynamics and the sports results of football teams. This is the article by Lago-Peñas and Sampaio (2015) which identifies how important is a good season start on elite soccer teams' performance and to examine whether this impact is related to the clubs' financial budget. The study is important because it has collected data from the English FA Premier League, French Ligue 1, Spanish La Liga, Italian Serie A and German Bundesliga for three consecutive seasons (2010-2011 to 2012-2013) and has grouped the different teams into different clusters to facilitate comparison. The results suggested that the better the team performance at the beginning of the season, the better the ranking at the end of the season. However, the impact of the effect depended on the clubs' annual budget. Therefore, it is evident that there is a concrete relationship between the economic-financial dynamics of the company and sports results, in addition to the intuitive relations between local economic development and football events of international interest, as happened in South Africa which hosted the world championship in 2010 (Mofokeng and Ndlovu, 2018).

The most recent studies also consider the updated legislation in force, and its effects on economic and sports results. In this regard, the study by Mourão and Gomes (2017) focused on financial sustainability of portuguese amateur soccer teams should be noted and especially the very recent one by Ghio *et al.* (2019) about the impact of financial fair play on Italian soccer clubs. The validity, in Europe, of the rules of financial fair play lead to disappointing results compared to the issues of Financial constraints on sport organizations' cost efficiency. In fact, from this study it seems that the new rules do not significantly improve the average efficiency of the Italian top-flight teams. This research is very close to the proposal outlined later and it will be interesting to verify the possible convergence on the conclusions.

Some conclusive bibliographical notes must be proposed with respect to the copious Italian bibliography, considering that this paper arises exclusively from quantitative data referring to the teams participating in the Italian Serie A championship.

The origins of the diffusion of football in Italy are outlined in Bortolotti (2002) and in the essay by Romanato (2008) which focus on a period in which the problems were very different, compared to the current ones. Instead, the progressive intertwining between football and the economy and therefore the

advent of alternative powers to sports meritocracy, are outlined in the book by De Ianni (2015) with reference to a century of Italian national history.

The writings of Lago *et al.* are more recent. (2004) and are dedicated to the football business, also focusing on the related financial crises. Di Maio's study (2014), in dealing with the economic perspective of football, also makes use of a comparison with the genetic homeland of sport which is England. On football as a business see also Cavallito (2012) and Tirrito (2005).

The accounting of football business management has been the subject, in Italy, of numerous writings, even modulated in relation to the evolution of the legislation. From the first proposals on the balance sheet of the Cesarini football clubs of 1985 and of Rusconi of 1990, we move on to the reflections of Bianchi and Corrado (2004) who, through the study of reports, also try to explain the reasons for the crisis in the sector. In 2004 it was also the study by Busardò which focused the accounting treatment of the "stock players", similar in terms of its basic logic, to that of the following year by Ragno (2005) which illustrated the "characteristic balance sheet items" of a football club: capitalization of costs for the stock of young players, players' registration rights, temporary assignment of the right to sports services, revenues for advertising, sponsorship, sale of television and image rights, etc. The 'Save Football' decree (Decree Law No. 282 of December 24, 2002, later converted into Law No. 27 of February 21, 2003) had effects on the accounting highlighted by Mancin (2007). Interesting the contemporary reflections of Pezzoli (2007).

The other scientific contributions are certainly more recent, typical of the last decade. The contribution of Frau in 2007 and that immediately following by Valeri in 2008 are important among the first publications concerning the application of the IAS / IFRS Standards in the balance sheet of football clubs. This is followed by the monograph by Mancin (2009) dedicated to the balance sheet of soccer companies and the contemporary article on the same theme (2009) by Nicolliello. Then we come to the very useful contribution of Bernoldi and Sottoriva (2011) who compare the Italian situation with international experience, highlighting above all the impact of the cd. "Financial fair play".

In 2017 the number of domestic scientific productions increases: that of Tortorano (2017) dedicated only to football teams listed, and two of Guarna (2017a and 2017b) related to the subject of financial reporting of professional football clubs and to the most restricted problem of accounting of the costs of the stock of young players of the teams. The last contribution is from 2018, again curated by Guarna and reserved for the consolidated balance sheet of professional football clubs.

RESEARCH METHODOLOGY: DATA COLLECTION AND SAMPLE CHARACTERISTICS

This study is based on the calculation of some economic and financial indices obtained from the balance sheets of the football teams that played in the Italian Serie A championship for the sports seasons 2012/13, 2013/14, 2014/15 e 2015/16. The teams are divided into two groups.

- Group 1: includes the clubs that in these four seasons have prevailed over all the others and that have always achieved positive results, placing themselves in the top 10 places in the final ranking (A.C. Milan S.p.A., A.S. Roma S.p.A., ACF Fiorentina S.p.A., F.C. Internazionale Milano S.p.A., Juventus Football Club S.p.A., S.S. Lazio S.p.A. and S.S.C. Napoli S.p.A.);
- Group 2: includes clubs that in these seasons are relegated to Serie B or that do not enjoy the popularity and sporting success of the previous group (A.C. Chievo-Verona S.R.L., Empoli F.B.C. S.P.A., Frosinone Calcio S.R.L., Hellas Verona Football Club S.P.A., S.P.A.L. 2013 S.P.A., Unione Sportiva Città di Palermo S.P.A. and U.S. Sassuolo Calcio S.R.L.).

Using the Aida database of the Van Dick Bureau, the indices and margins listed in table 1 are calculated, developing their temporal and spatial comparison.

Table 1: Indices and margins	
Economic and income analysis	Sales Revenue Profit/Loss for the period Ebitda Ebitda /Sales Roa Consumption margin
Financial and asset analysis	Total of Activities Equity Debt ratio Net Working Capital Treasury Margin Cash Flow

From this comparison it is possible to highlight the relationships between the economic, patrimonial and financial situation of each team with the sports results.

RESULTS AND DISCUSSION

Trend Analysis: Economic and Income Analysis

Sales Revenue

This quantitative parameter is obtained from the Income Statement. From table 2 it is possible to notice the gap existing between the top-ranking clubs and the less successful clubs. The difference is accentuated starting with the 2014/15 season.

Profit/Loss for the period

It measures the gap between accrued revenues and accrued costs. In the two groups it takes the form illustrated in table n. 3.

The situation is paradoxical: smaller teams can easily achieve positive management results. Serious losses, on the other hand, for Group 1 teams especially in the 2014/15 season, due to particularly negative results of the AC. Milan (-93.466.015 €) and the F.C. Internazionale Milano (-73,985,539 €) which considerably reduce the average result of their group

EBITDA

Earnings Before Interest Taxes Depreciation and Amortization is an accounting measure calculated using a company's net earnings, before interest expenses, taxes, depreciation, and amortization are subtracted. It is an objective indicator of the economic performance of ordinary operations and represents a potential monetary flow because all non-monetary costs are excluded. If it assumes a negative value, the company presumably also has problems with monetary flows (table 4).

There is no constant trend for the two groups.

Group 1: the negative season is 2014/15, with a reduction of about 90% compared to the previous year, but followed by a decisive recovery in 2015/16.

Group 2: there are no strongly negative or positive results. The results are not very far from the standard average of 5,000,000 / 10,000,000. In the 2013/14 season, Group 2 reaches and exceeds (with just over 850,000) the Group 1.

EBITDA/Sales

It is a percentage index that interprets the operating profitability of a company: when this index increases, there is a reduction in the incidence of operating costs. The trend is shown in table 5.

It is not easy to define a standard trend for the two Groups: sometimes opposite results are achieved (for example in the 2012/13 season) or very similar (for example in the 2015/16 season).

ROA

Return on Assets, index that expresses the performance of the resources used in the business activity. It is obtained from the formula $\text{Operating income} / \text{Total assets}$ (table 6).

It is emphasized that both groups, in the seasons examined, always report negative results, with operating incomes lower than zero.

Consumption margin

It is an exclusively income index, for the calculation in fact only economic quantities are used. It consists of Revenues + Internal Works + Change in Works + Change in Inventory Products - Change in Raw Materials (table 7).

The top clubs maintain their primacy over smaller clubs, and the difference increases over time.

Trend Analysis: Financial and Asset Analysis

Total assets

The Balance Sheet provides a representation of the equity and financial position of the company. This value includes the four macro-classes of the Assets: Receivables from shareholders, Fixed assets, Current assets and Accruals and Prepayments.

From table 8, we note that the average of Total Group 1 Activities has values significantly higher than those of Group 2 (approximately 300,000,000 more). The gap derives from the active consistency of the best teams.

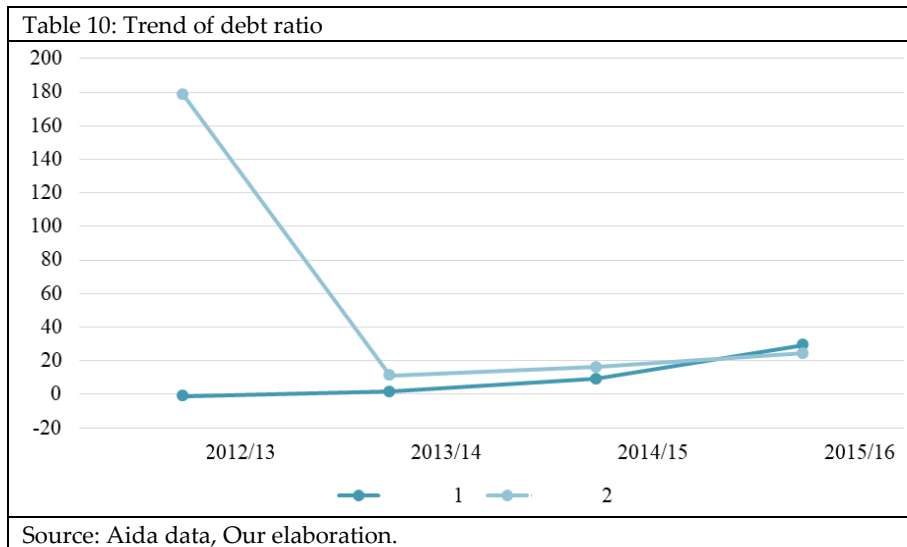

Equity

Table 9 confirms the superiority of the top-flight clubs, due to the solidity of the net assets of the big teams.

Debt ratio

This index expresses the proportion existing between the total Assets and the Net Equity: it is calculated as the ratio between the two quantities (table 10).

In the first season the Group 2 has much higher values due above all to S.P.A.L. In the following two seasons the results align.

Net working capital

Net working capital results from the difference between current assets and short-term debts: it expresses the suitability of current and near-term liquidity to face debts with next maturity.

Table 11 shows that the “lower” teams can manage liquidity and cover short-term debts more easily, although both groups in the sample report negative results.

Treasury margin

It represents the capacity of present and future liquidity to cover debts with short-term maturity. The trend is in table 12.

Completely negative results, especially for the top-class clubs due, above all, for the 2012/13 and 2013/14 seasons, to A.C. Milan and F.C. Milan international. Opposite situation for S.S.C. Naples which, in the last three seasons, has achieved positive results, the only one of the “d'élite” group.

Cash Flow

The last index analyzed is the operating cash flow, calculated using the synthetic method: Profit (Loss) for the year + Amortization and Depreciation (table 13).

CONCLUSIONS AND IMPLICATIONS: LIMITATIONS AND FUTURE PERSPECTIVES

The proposed tables do not allow a single judgment on the economic and financial situation of the Italian soccer teams in the A series. Therefore, it is necessary to distinguish the economic profile from the patrimonial one, to formulate some final considerations.

Compared to the typically profitable parameters, obviously, the winning teams present much higher revenues and margins on consumption compared to those with modest sports results. Their attractive power is greater and attributable to their successes. However, it is to be assumed that the operating costs are very high, considering that the income of the best teams is worse than that of the smaller ones. This consideration favors the smaller dimensions, evidently more suitable for a balanced economic management. This conclusion is only partially confirmed by the other income ratios such as EBITDA, EBITDA/Sales and ROA: their fluctuating trend, in fact, does not allow for a single judgment.

The size of the balance sheet assets is consistent with the sports results: obviously the winning teams present greater investments and are more capitalized than the smaller ones. The judgment on the debt is substantially similar for the two groups, at least in the tendential aspects. Therefore, the most important teams present an adequate balance between financing and medium-long term investments, certainly better than that of the smaller ones. Instead, the judgment is contrary to the short-term perspective considering that the values of treasury margins and net working capital are more favorable for teams in group B.

The static analysis leads to significant critical points on the short-term solvency of the major teams, only partially mitigated by a better cash flow.

These considerations add to similar findings that have been formulated by the best international doctrine. The results should be compared with the studies of Gerrard (2006) and of Howard and Crompton (2002). Further useful considerations could be made by comparing these conclusions with the more recent conclusions of Storm (2012) and Lago-Peñas and Sampaio (2015). It could be a subsequent study, considering now the difficulties of comparison because the researches were conducted on different samples at different times.

In any case, such studies have the merit of highlighting the problems of economic and financial sustainability that are often sacrificed, considering the prevailing social and educational value attributed to football. Football is a phenomenon that must necessarily tend to rebalance its management dynamics, avoiding unbearable investments often induced only by a desire for merely sporting success. Therefore, love for one's team must not obscure the economic and financial logic that must necessarily be respected to guarantee the durability of this sport.

The limitation of this research is its merely quantitative nature and the relatively small sample of teams in addition to the short period of time considered. Similar methods could also be applied to teams participating in the Serie B championship and also to those of the minor series. In fact, it is very likely that the outcomes may be significantly different, depending on the different characteristics of the league which may be attractive in terms of financial and income resources.

It would also be appropriate to integrate the quantitative dimension with qualitative findings and, in addition, to adequately investigate the social aspect of these companies. Sport, and football, as already repeated, is not limited to a mere business, instead involving subjective psychological, relational and therefore social aspects.

However, these presented results can be useful to the scholars of the managerial dynamics of companies, but also and above all to those who supervise the regularity of the sector, as well as the leaders of the football teams involved in the study.

Moreover, the methodology can be easily exported even in contexts different from the Italian one: other championships, other economic and financial dimensions, different sporting outcomes but however similar analyzes with reflections that can improve the durability of the companies and, with it, also the sports results and fan loyalty.

In this way, from Italy to the rest of the world, not only pleasant competitive shows can be exported, but also and above all scientific analyzes of the phenomenon that can have very useful practical implications.

Finally, the paper can be used in sports management courses. Future football team managers should be trained in classrooms with respect to these analysis tools so that they can transfer the logic of constant monitoring of economic and financial trends into the world of football, to intervene promptly in the event of symptoms of decline and crisis. The construction of a managerial mentality for the best management of football teams must be a continuous and widespread process, so that even sport can make use of the most recent control and programming methods.

This, of course, does not reduce the right passion for the sporting dimension that can also be reinforced by the evidence of correct balance-sheets. Furthermore, there would also be benefits for tax offices for the constant revenue that would be generated. Even the administrative directors of football teams have an interest in balanced management to replace instinctive and improvised directions.

The solidity of the football teams would benefit all the related industries that develop around sports competitions.

Finally, it must be considered that sports tourism represents a significant and appreciated phenomenon, naturally hoping that it will not turn into intemperance and violent clashes.

ABSTRACT

Energy is everywhere the first factor of production. Countries, such as Italy, that import energy must activate all possible strategies to reduce their cost, also operating on the market where the distribution companies are located. Starting from the hypothesis that the international crisis of 2008 has generated an imbalance about the relations between sources and patrimonial uses that led to subsequent restructuring, this paper shows the result of a comparative spatial and temporal analysis about the financial statements of 1,761 Italian commercial companies, even distinguishing them in relation to their operation in the three national macro areas. The trend of the current ratio and the fixed asset to equity capital margin for 10 years was analysed. The results were also subjected to the analysis of variance (ANOVA).

The sector is imbalanced, especially in the medium-long term, therefore in need of significant contributions of equity. There are substantial differences between Italian macro areas but they cannot be ascribed to the international economic crisis and its consequences in subsequent years. The starting hypothesis has not been confirmed. The trend in financial statement indicators does not appear in relation to the international economic events of 2008 and their consequences. The trend of the analysed quantities probably originates in different factors typical of the sector and the territory. It will be necessary to develop similar but more detailed analysis using other indices and asset margins, while also allowing them to economic and financial ratios. The paper is original for a methodology never applied to companies in the sector. The results are useful for Italian entrepreneurs and government authorities.

Keywords: Financial statement; Ratios; Performance; Balance Sheet; Italian Companies; Distribution Fuel; International Crisis.

INTRODUCTION AND PURPOSE: STRUCTURE OF THE ESSAY

Energy has been the first factor of production in any nation.

Italy, in particular, has an economy heavily dependent by the importation of oil that conditions greatly its trade balance and gross domestic product (Colombo, 2000). This makes it necessary to activate all the possible strategies to reduce the cost of the energy bill to businesses and families. The rationalization of the sector also requires assessments relating to the market structure (Juvenal and Petrella, 2014; Panas and Ninni, 2000; Smith, 2009. With particular reference to Italy: Roncaglia, 1983; Dorigoni and Pontoni, 2008; Riboldazzi, 2011a and 2011b; Di Benedetto, 2015) and therefore to the more or less articulated presence of fuel distribution companies, moreover subject to specific legislation also to protect public safety.

The 2008 crisis has obviously directly affected the entire energy and oil sector in particular, including the distribution companies that represent the last phase of the supply chain before final consumption.

This paper focuses on the asset structure of Italian fuel marketing companies through the analysis of financial statements, also analysing the ten-year trends of two asset indicators (Current ratio and Fixed asset to equity capital margin) for the entire nation and respect to the three macro areas in which traditionally the territory is divided: North, Centre, South and islands. The main purpose is to verify what has been the impact of the crisis on the short and medium-long term capital structure and how companies have subsequently reacted to the challenges, with the related consequences on the economic balance.

The starting hypothesis (H_0) is that the crisis has generated an imbalance in the relationships between sources and uses and that the necessary restructuring has subsequently led to the search for new capital structures which are better for results. A more complete picture can be had when the subsequent patrimonial analysis will be adequately integrated with future studies on the economic and financial trend in the decade considered.

Consequently, the research questions to which the subsequent analysis answers are the following:

RQ1: what was the situation of asset balance/imbalance in the year of the crisis?

RQ2: what has been the consequences on the asset structure of post-crisis recovery strategies implemented in following years?

RQ3: are there substantial and significant differences between Italian macro-areas respect to the different asset structure of companies in the sector?

In order to answer to these research questions, the study carries a quantitative analysis based on the financial statements of a sample of companies for ten consecutive years. By analysing the time trend of Current ratio and Fixed asset to equity capital margin, a first view on companies trend was developed.

The study, after explaining some evidences from international literature revue, shows some data on fuel distribution companies in Italy. Subsequently the methodology of the empirical research is described which uses numerous financial statements of the companies that operate in the sector, distinguished by geographical area (North, Centre and South Italy). Below is an illustration of the trends of the two mentioned indicators.

Finally, the conclusions and possible future has been presented to ask clear open questions.

LITERATURE REVIEW

The analysis of the management balances of the fuel distribution companies has been substantially neglected by the international and Italian doctrine.

These companies, in fact, have often been subjected to studies concerning market balances, considering their incidence in fuel price formation. The managerial problems faced are mainly dedicated to the optimization of the distribution processes, to the problems of respecting the environment and the health of the employees who, obviously, also consider the legislation in force in a given country.

It is possible to outline a different literature distinguishing the international one from the typical contributions of Italian doctrine.

International bibliography

The richest contributions are certainly related to the trends of the fuel market which obviously affect the fixing of the international price characterized by relative volatility, also in relation to the more or less marked competition of the productive countries and to the alternative energy choices now widespread everywhere.

The most typical aspects of this particular market are highlighted by Hulsshod *et al.* (2016) with particular reference to natural gas. More numerous are, instead, the contributions related to the oil market, among which the writings of Juvenal and Petrella (2014) that highlight the speculative aspects, Panas and Ninni (2000) that try to emphasize the bearing elements in a market that appears initially chaotic, as subsequently also Smith (2009) hypothesizes. In the market analysis, obviously, an explicit reference to the OPEC that has characterised the history of fuels' supply throughout the world cannot be missing. In this regard, reference is made to the recent contribution of Al Rousan *et al.* (2018).

Once the supply and demand dynamics have been framed, the "price" summary is the subject of numerous international studies. With reference to Europe, refer to Wlazlowski *et al.* (2009). A global dimension is instead proposed already by Baumeister and Peersman (2013) who focused on the role of time-varying price elasticities in accounting for volatility changes in the crude oil market, and then

from Belyi (2016) who tried to answer the question “Why is the oil price not about equilibrium?”, developing an acute socio-economic survey on the oil market.

These are important contributions, however, characterised by a general economic caliber that provide the manager of the individual companies with trend indications on the possible future developments of the oil supply and its demand for the consumption of households and companies.

They, like others, therefore provide general indications without, however, entering into the specific managerial problems of the single distribution company.

Closer to the business administration features of this paper, the studies that outline the organizational, and more specifically logistic, problems of the commercial companies in the sector. The broader theme of planning, execution and control system for fuel distribution, although limited to Chile, was developed by Nussbaum *et al.*, in 1997. More recently, however, the study with some similar intentions by Azimi *et al.* (2010) who proposed RFID technology in “Iranian fuel distribution system”: the interesting case study has aimed at outlining a new model to identify and evaluate critical success factors in Information Technology (IT) projects.

Naturally, the subjects that contribute directly and indirectly to the placement of the product affect distribution logics. In this regard, some interesting ideas have been proposed analysing the governance of transactions adopted by fuel distributors with gas station retailers in the state of São Paulo (De Souza Siqueira Soares *et al.*, 2015).

However, the topics dealt with most analytically in the international arena are those of logistics and in particular those of the supply chain. In this regard, we refer for example to the study by Thunnissen *et al.* (2015) dedicated to a plan for the Liquefied Natural Gas (LNG) distribution network which is a sustainable fuels for the transport and maritime sector.

Logistics and supply chain in China, with reference to fuels, were also the subject of reflection by Jin *et al.*, already in 2010.

Obviously international authors do not neglect the delicate current issue of environmental sustainability and the safety of workers in companies in the sector which must be combined with customer satisfaction. Among others, it is important to read the essay by Hauptmann (2009) which proposes a Quality-Environment-Occupational Health and Safety Integrated Management System for a fuel distribution station: the client’s satisfaction, the preservation of the environment, the safety and labor health are deeply connected with the development strategy and the definitive values of the fuel distribution stations.

A better organization of the system about each distribution company would improve the incomes of each protagonist and would also reduce the serious road accidents in the logistics cost distribution of liquid fuels (Cattaneo *et al.*, 2016).

A turning point in the management of fuel distribution companies could be proposed by the adaptation of the balanced scorecard in fuel distribution companies (De Barros and Wanderley, 2016).

Italian bibliography

Italian scholars have also focused on analysing trends in fuel markets in order to provide a general economic framework within which national companies operate. Surely it is useful to read the text by Colombo (2000) which provides a complete picture about the historical evolution and the scenarios relating to the wider energy sector.

The analysis of the fuel market has been followed over time, primarily by Roncaglia, (1983), which was followed by the research of Dorigoni and Pontoni, in the 2008. The studies of Riboldazzi (2011a and 2011b) are more recent, although they are almost exclusively dedicated to automotive fuel. More recent, instead, is the research by Di Benedetto (2015) which extends his observation also to biofuels.

However, Italian bibliography has also focused on regional situations induced by current legislation. Thus, territorial specialist publications tracing the situation of fuel distribution in the regions can be traced: Sardegna (Scanu and Ugolini, 1995), Toscana (Regione Toscana, 1991), Umbria (Agenzia Umbria Ricerche, 2010), Lazio (Cardoni and Linguanti, 2010), Lombardia (Regione Lombardia, 2010) and Campania (Regione Campania, 2016).

Interesting are the predominantly legal considerations that in any case affect the management of fuel distributors. Problems arise for the location near the protected areas for the risks of pollution (Perillo, 2014), or in shopping centers, considering the health risks of the numerous customers (Bassani, 2008). The lawyer also reflects on the different types of contracts that relate to this particular commodity (Munzone and Sciuto, 2000) and on the land to be considered pertinent to the fuel distribution system (Vaccà, 1990).

The reading of the specialised volume on automotive fuel by Salvadorini (2010) and the more recent one by Fiammelli (2015) is also useful.

It is evident that, in the international and Italian bibliography, there are no specialised studies on the economic and financial balance based on the analysis of financial statements. The only writing that methodologically approaches, while dealing the broader topic of energy, is the publication Iovino and Migliaccio, G. (in press). This paper, therefore, would like to fill a gap by providing a first interpretation of the problem using recent information.

RESEARCH METHODOLOGY: DATA COLLECTION AND SAMPLE CHARACTERISTICS

The focus of this study is the application of the principles of balance analysis, through the determination and temporal comparison of two asset indicators about the companies that characterise

the distribution sector and in the retail fuel trade, so as to be able to consider the trend of the values assumed by them in the period considered, from 2008 to 2017: focusing on a broad time frame, it has been possible to better assess the reactions of companies to the different phases of the economic cycle that has affected the international scene with obvious repercussions in Italy.

The distribution of companies on the national territory is very varied, which is why it has been considered necessary to carry out territorial discrimination. Italian companies have been grouped into three macro-areas: North, Centre and South, according to the geographical distribution that is used by the National Statistics Institute (ISTAT).

Object of the research has been the financial statements of a sample of medium-large companies with turnover exceeding 800,000 euros, in ten consecutive years.

The choice of financial statements has been based on the Ateco 2007 classification which in Italy divides the various economic activities into different classes and subclasses. Within Class G: Wholesale and retail trade; repair of motor vehicles and motorcycles, group 47 is related only to retail trade (excluding motor vehicles and motorcycles). It is subdivided into different groups, including the 47.3 - Retail trade in automotive fuel in specialised stores, to which this study refers.

The financial statements of 1,761 companies has been analysed with different locations in the three macro-areas of the country (figures 1). Southern Italy appears to be the largest macro-area: in addition to the 6 regions of the South it groups together the two largest islands, for a total of 892 companies; a value far higher than in the North which, although collecting the North-East and the North-West, has a total of 447 companies. Centre comprises 4 regions, for a total of 422 companies.

Figure 1: Geographical distribution by large area

Source: elaboration on AIDA database

Specifically, and as shown in Figure 2, among the Italian regions Campania appears to have the record for the largest number of companies engaged in the distribution and retail trade of fuel with 339 companies, according to Lazio with 281, while in third place Apulia is represented with 173 companies.

The dominance of Campania is the result of the expansion about international trade and mobility of goods and people in the Mediterranean, as a transit area for trade flows between Europe and Asia, which have given the South a central role in the context of maritime transport. In this context, the port of Naples has acquired a significant position among the Mediterranean ports, being directly connected with the Middle and Far East, Central and North America, Africa and, via transshipment, with the whole world.

Figure 2: Geographical distribution by region

It should be pointed out, however, that the financial statements of the 1,761 companies that, overall, operated in the sector considered, were not always available. The disaggregated data of the sample investigated by geographical area and year is shown in Table 1:

Table 1: Number of available financial statements										
	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017
ITALY	799	860	929	1008	1045	1108	1158	1222	1240	1132
NORTH	244	271	286	307	316	332	331	342	345	338

The evolution of the two main asset indicators chosen is illustrated below: the annual value is the average of the available data, applying, where possible, the Anova test for calculating variance. (Gu, 2013; Solari *et al.*, 2009; Strang, 1980; Ross e Willson, 2017; HackerJoel e Angiolillo-Bent, 1981; Quirk, 2012; Liao e Li, 2018).

RESULTS AND DISCUSSION: TREND ANALYSIS

Current ratio

The current ratio expresses the proportion between circulating assets and liabilities by relating them. According to commonly accepted and widespread practice, a value of this index:

1. greater than 2, expresses an optimal situation;
2. between 1.5 and 1.7, a satisfactory situation;
3. less than 1.25, a situation subject to control;
4. less than 1, a situation of imbalance.

The analysis generated the data of table 2, which highlights the national average and the disaggregated values by macro area. They are then represented graphically in Figure 3.

	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017
ITALY	0,93	1,39	1,25	1,26	1,55	1,35	1,53	1,29	1,21	1,05
NORTH	1,43	2,05	1,00	1,08	1,84	1,46	1,39	0,88	1,02	1,02
CENTRE	0,94	0,96	1,02	1,40	1,30	0,91	0,96	0,98	1,03	0,86
SOUTH AND ISLANDS	0,43	1,15	1,73	1,29	1,50	1,68	2,23	2,00	1,59	1,26

Source: elaboration on AIDA database

Figure 3: Evolution of current ratio

Source: elaboration on AIDA database

The evolution of the index is not homogeneous. There are significant gaps in 2008 (one point between North and South), in 2009 (there is a gap of more than one point between North and Centre) and also in 2015 (North remains at 0.88, while South reaches the optimal value equal to 2). The optimal situation with an index greater than 2 therefore occurs only for South in 2014 and 2015, and in 2009 for Northern

Italy. There are also situations in which the ratio takes values below the critical threshold of 1, especially in Central Italy. The lowest value is recorded in 2008 in Southern Italy, the year of the international crisis. Speculation has affected the increase in the price of oil between 2004 and 2008 (Smith, 2009), generating significant consequences on the working capital of companies operating in the sector. The variance has been therefore analysed to verify whether the differences between the three groups are statistically significant (table 3).

Table 3: Analysis of variance of current ratio						
Groups	Count	Sum	Average	Variance		
North	10	13,17	1,317	0,152601		
Centre	10	10,36	1,036	0,03036		
South and Islands	10	14,86	1,486	0,249271		
Source of Variation	SS	df	MS	F	P-value	F crit
Between groups	1,033407	2	0,516703	3,58629	0,041568	3,354131
Within groups	3,89009	27	0,144077			
Total	4,923497	29				
Source: elaboration on AIDA database						

Table 3 shows that in the current ratio $F > F_{crit}$ and P-value is less than 0.05; for which the hypothesis H_0 cannot be confirmed: at least one of the groups considered differs significantly from the others, but the exact nature of the difference is not specified. This constitutes one of the main limitations of this analysis: the averages are all different from each other or one is different from the others and, if so, which one? It would be advisable to make a comparison between the averages in order to identify a subset of all the populations whose averages can be considered statistically equal.

The fixed asset to equity capital margin

The fixed asset to equity capital margin is determined by deducting the value of the net fixed assets from the net capital. The higher this indicator, the lower the financial risk: if this margin is positive, it means that the fixed assets have been completely financed with equity. If the margin is negative, it means instead that the fixed capital is partly financed with debts and this can expose the company to considerable problems, given that even a part of the stock (permanent stock) represents a lasting financial requirement.

Table 4: Analysis of fixed asset to equity capital margin				
	ITALY	NORTH	CENTRE	SOUTH AND ISLANDS
2008	- 493	- 235	- 1.039	- 206
2009	- 407	-249	- 726	- 245
2010	- 402	-93	- 876	-237
2011	- 265	- 107	- 499	- 191
2012	- 408	-80	- 965	-179
2013	- 413	-149	- 953	-137
2014	- 454	-163	- 1.104	-96
2015	- 420	- 233	- 939	-89
2016	- 335	- 250	- 655	-101
2017	- 289	- 213	- 539	- 60
Source: elaboration on AIDA database				

Table 4, with figures expressed in thousands of euro, expresses the drama of the Italian situation: in each geographical area the companies record negative values.

Given the wide gap between the macro-areas it has been difficult to construct a graph to measure the evolution of the structure margin in the decade in question.

Table 5: Analysis of variance of fixed asset to equity capital margin						
Groups	Count	Sum	Avarage	Variance		
North	10	- 1.772	- 177,2	4.517,067		
Centre	10	- 8.349	- 834,2	41.448,77		
South and Islands	10	- 1.541	- 154,1	4.376,767		
Source of variation	SS	df	MS	F	P-value	F crit
Between groups	2988638	2	1494319	89,04899	1,29399	3,354131
Within groups	453083,4	27	16780,87			
Total	3441722	29				
Source: elaboration on AIDA database						

From table 5 it emerges that in the fixed asset to equity capital margin $F > F_{crit}$ for which, once again, the hypothesis H_0 cannot be confirmed: at least one of the groups considered differs significantly from the others, but the exact nature of the difference is not specified.

CONCLUSIONS AND IMPLICATIONS: LIMITS AND PERSPECTIVES

This study investigated the asset balances of companies dedicated to the distribution of fuel in Italy in the decade 2008-2017, starting from the initial hypothesis (H_0) that the crisis has generated an imbalance in the relationships between sources and uses and that subsequently the necessary restructurings have induced to search for new assets with better results. To this end, responding to three research questions the national situation has been outlined by disaggregating the also in the three macro regional areas of the country. It was therefore (RQ₁) presented the balance/imbalance situation in the year of the crisis (2008) and in the subsequent ones to assess (RQ₂) the consequences on the capital structure of post-crisis recovery strategies.

The outcomes do not allow to confirm the starting hypothesis because no tendencies have been identified that could lead to the conclusion that the crisis has generated imbalances subsequently restored. The trend in values, in fact, does not follow appreciable trends. In fact, they appear extremely volatile presumably derived from factors that are independent of the economic and financial situation induced by the international crisis. Further and more in-depth analysis are needed to understand such anomalous and discontinuous trends.

The first certain fact, at national level, is a significant imbalance in relation to working capital, which is also widespread in regional macro-areas which, however, does not follow a homogeneous trend that can be interpreted only in relation to the international economic context.

A second objectionable evidence is the worrying medium-long term situation, considering the constantly negative value at the national level of the structure margin. The companies in the sector therefore present a situation of undercapitalization which presumably leads to significant debt. Also for this index we can see (RQ₃) substantial and significant differences between Italian macro-areas, without identifying tendential lines attributable to the international economic crisis.

The limit of this study is first of all in its purely quantitative nature based on a variable number of financial statements, albeit high, in the decade considered. The analysis should be implemented first of all by using additional reports and margins relating to the companies asset structure to better understand financial dynamics.

Furthermore, it should be linked to the trend of the general and operational profitability of the companies, considering the obvious relationships between economic results pertaining to each year and asset structure.

A complete and exhaustive picture of the economic and social value of this type of company could also have, by adding to the described quantitative analyzes, the results of specific investigations related to the achievement of the social purposes that also characterize them, perhaps verifying the presence of social budgets that better focus their specific mission. The study of environmental budgets would be very useful, considering the ecological and health impact that these companies could have on the sites (Hauptmann, 2009; Dainese, 2006; Mauro et al., 1996). In Italy this is possible considering the particular sensitivity shown, first of all from the best doctrine towards social and above all environmental communications (among others: Andrei and Pesci, 2009; Condosta, 2006; Paris, 2002; Mio, 1996) which recently converge towards a broader integrated report (Tardia, 2015; Busco et al., 2018; Badia et al., 2018; Gesuele, 2015; Riccaboni et al., 2014; Alvi, 2014; Indelicato, 2014; Panizza, 2014; Gherardi, 2014; Fazzini, 2014; Bianchi, 2013; Gasperini and Bigotto, 2013; Zambon et al. 2013).

Further and more in-depth statistical analysis could better favor the comparison between the different areas of the country. They could be added to the ANOVA methodology used here which has already

demonstrated its usefulness in investigations of this type (Iovino and Migliaccio, 2018¹, 2018², 2019; Fusco and Migliaccio, 2016¹, 2016², 2018, 2019; Migliaccio and Fusco, 2018; Migliaccio and Arena, 2018²). Despite these limitations, the study is among the first to investigate national business situations using the results of the financial statements. It introduces, therefore, a methodology widespread in the doctrine but still eluded with reference to this particular sector which is nevertheless fundamental for energy costs. The outcomes can be useful to individual companies that are thus able to deal with average sector data, starting a critical process on their economic, asset and financial management. Furthermore, they can be the object of attention for the government of the sector in need of financing, especially in the medium-long term. The public authorities must consider its needs, even considering its strategic importance for all the productive processes of a nation.

It can also be a valuable aid for subsequent research that uses the same methodology.

The paper can also be used in higher education courses specifically dedicated to financial statement analysis and company statistics, also to solicit adequate and useful reflections on the necessary yet complex balances between economy, economic-patrimonial relations, environmental impacts and social relations.

ABSTRACT

This research assesses the data-related practices maturity in Romanian health establishments ware data, based on good Governance and Management approaches, on professionals involved skills, their roles and responsibilities. Bearing in mind that the correct processing of data requires data-dedicated-staffs, the research develops a model of data ownership and stewardship allocation to sustain related projects success.

Using the interview techniques, we review comparatively the data projects goals, methodologies applied, staffs selection, allocation of responsibilities and future milestones. Mixed specialists from the health establishments spend significant efforts to design related framework, potential document expectations and requirements, best ways to hire staffs up to invest in technology. Procedures and regulations implementation have been studied linked to the formal strategic engagement to assure achievements.

The findings rely on a limited number of analyzed data-centered set-ups. Analyzing the pitfalls of the current practices we suggest in this paper a plan that allows the health establishments to ensure that policies and procedures related are correctly managed. The data centered mentality can be disseminated through informal mentoring practices.

The research value consists in the method chosen to build the operating model centered on data and the steps taken to build governance, management and designate data-responsible labor-force.

Keywords: data governance; data management; data ownership, stewardship; health establishments; mentoring.

INTRODUCTION

The researches on data-centered activities allude to the huge volumes of data that currently any establishment deals with (Pierce *et al*, 2008; Weber *et al*, 2009; Fu, *et al*, 2010; Stickel and Vanderwalk, 2014; Al-Ruithe *et al*, 2018). Without entirely contradicting the statement, we go on and affirm that data exists in any organization since the very beginning and grows together with the business. In

industries like health, Pharma, care, ICT or financial services, data bases increase with time, given on one hand the number of people accessing them, and on the other hand the increasing number of activities, processes, operations, regulations, procedures, therapies, products, services, and markets they operate with.

Data diversification accompanied all the market movements, but not to the extent that would generate a paradigm shift related to new ways in which establishments could be managed. Thus, new preoccupations in management could help better value the data and design new maneuvers and upgrades. There are scientists that give special credit to few factors: ongoing, operational needs or requirements from the regulatory bodies (McDowall, 2017). Daily operations require and use preexisting data, they generate additional data and store them for the future use. Each new patient's data becomes aggregated products that will help to foresee/anticipate/predict processing operations resulting in even more data. Until these days, data wasn't used to generate new operating models. This could be the facilitator of a revolutionary way to organize data, ideas, process, and remodel the operational philosophy according to an increased regulatory systems to be used for fasten processing and use of any data in favor of both people and institutions.

Health industry in general – and the Romanian one in particular are not exceptions. Despite existing procedures and guidelines, they don't operate on a complex profit-based approach. Their functioning is unsteady because of health practices concerned, inadequate design, consistency or expected efficiency that is incompletely monitored and irregularly evaluated by the regulators based on a corporate governance and inconsistent assessment or regulatory reporting. Under this scrutiny, health industry has admitted to be facing data-related issues.

The present paper assesses the maturity of the data-related practices in the Romanian health and care system through their Data Governance and Management, the involved professionals' typology together with their roles and responsibilities.

DATA GOVERNANCE AND DATA MANAGEMENT – THEORETICAL APPROACHES

Individuals and specialists bewilder of the exponential growth of data (Wilbanks and Lehman, 2012), their complexity (Al-Ruithe *et al*, 2018) and worldly uses (Al-Ruithe *et al*, 2018). Some issues look similar in any organization or related linked to the data use: how to find the required data (Stickel and Vandervalk, 2014), how to identify the correct traceability to match different sources, how to consolidate information to allow their integration and connectivity (Stickel and Vandervalk, 2014). From this perspective, the limited knowledge management generates even more difficulties in finding solutions and responsible persons. Other non-conformities refer to the fragmented and unserviceable

content or inappropriate definition of similar data, managing (Al-Ruithe *et al*, 2018). To overcome these issues, the health establishments have recently started to allocate significant resources in designing adequate Data-centered programs, focusing on good governing and data management.

The review of the existing literature shows that Data governance is related to allocating decision-making rights, authority and consequently - duties (Otto, 2011), and that is ensured through a structural framework (Weber *et al*, 2009). The decisions to be taken refer not only to data, but also to the information technology systems that store or process the data (Wilbanks and Lehman, 2012). Data should be treated as an important asset (Khatri and Brown 2010; Early, 2011) that needs to be planned, monitored, assessed, implemented and evaluated by feed-backs; therefore data needs appropriate handling by skilled professionals (educated or mentored), able to appreciate, use and maximize its value.

Researchers identify some main pillars on which data governance is based, like the existence of standards (Otto, 2011, Pierce *et al*, 2008), well defined logical data models and a proper identification of the data lifecycle (IBM 2007, Pierce *et al*, 2008), properly framed data roles (data owners, data stewards, data modelers, data miners, data committees (Otto, 2011).

A comprehensive perspective comes from the Data Governance Institute which sees data governance as a system with the decision-rights as part of a matrix that combines persons, procedures, standards, methods, models. The matrix system includes also more volatile components like people behavior or even a code of ethical conduct (Ron *et al*, 2017).

We keep in mind all the above when analyze, comparatively, the methods chosen by two players of the health industry to create a new operating model centered on data, to solve issues related to inadequate practices of data management.

GOVERNANCE IN PRACTICE

Romanian health industry of the last 20 years did not prove to be one of the most innovative. False regulated and heavily bureaucratic, the health clinics excel with processes well described and fully documented – from the flows design, to setting up responsibilities for each step, and providing templates. Data lifecycle insufficiently documented has an obsessive focus on technological aspects, data flows, storage, backup, etc. They do not have anything linked to the dynamic of data, their aggregated simultaneous use. From the improvements point of view, the private health establishments have invested in everything that could increase the services' market share and the high technology procurement, to reduce non-performance and costs, to improve ratios. Given the central executive pathway, they are stopped from creating philosophical approaches. Or, from our point of view, data management is, above all, an attitude, and without it, nothing is enough.

Private health establishments have managed data from the first day of their inception; data quality was always one of the audit findings capable to generate action plans. Reports have always been generated and reporting capabilities have been constantly taken into account for improvements. But this was always only the result of a project carried on, or of the need to accommodate new processes, to solve encountered problems. It was a mean, not a goal in itself. Only in the last few year, as a result of increased incapacity to deal with the requirements and costs related to data management, Romanian health logistics became more aware of the international practices related to data. By analyzing two of the health networks from the Romanian market (A and B), we will see how the data governance principles have been understood and put in practice in public and private areas.

Our research methodology is qualitative, based on interviews with the data projects teams and provided documentation review. We have gather information about the following: organizational structure, data related documentation; roles and responsibilities related to data; staff; related IT infrastructure; methods of communication within the organization. The following table presents the findings:

	Establishment A	Establishment B
Period of data governance activities	Start date: beginning of 2017; not ended	Start date: mid of 2016; not ended
Organizational structure	A new division has been set up, Data Management and Business Intelligence (DMBI), under the subordination of the Risk Officer. The division consists of 4 departments: Data warehouse, Business Intelligence, Data Management, and Centralized Reporting.	#N/A One new role created: Data Officer reporting to the Risk and Safety Officer
Staffing – persons, profiles	Director; deputy director; 4 managers – from within the organization Profile: two reporting specialists (sq. literate), one data warehouse specialist, one loan administration specialist, one credit risk specialist Previous experience related to data governance: none	Loan administration specialist
Involved external parties	Consultants	Directly: Parent company; Indirectly: consultants hired by the parent company, project based
Documentation	The Data Strategy - describe the inception's vision related to data – data objectives, the approach to improving the availability, quality, management and use of data within the institution, using common language, systems and processes. The operating model policy – describes the structures involved in the management of data (IT divisions, DMBI, the business departments from the institution), the new roles and responsibilities associated to data, the governing bodies (committees) The data management policy, describing the data quality principles and the associated roles The reporting procedure, describing the flow for the reporting requests; includes templates for business	Data quality guidelines Rules for assigning the ownership for corporate data

	analysis, technical analysis, requests logs.	
Roles	Data Modeler; Data Custodian; Data Steward; Data Users	Data Officer; Data Owners; Data Users
Related IT infrastructure	Data warehouse – build in cooperation with the consultants, IT and the new division	#N/A
Communication	Occasional: Through presentations to all directors of departments, related to the status of data warehouse development and planned developments of Business Intelligence infrastructure. Formal, recurrent: Data committees – monthly and quarterly, with designated staff, related to data related issues.	Occasional, whenever projects related to data impose it or related to encountered data quality issues.

In brief, the two health establishments under analysis started three years ago to take actions related to data. During the interviews the project teams mentioned that the reasons for starting the projects have been the official authorities' recommendations, made during the annual audit, who considered that the data quality is not properly monitored and there is no single "golden source" for reporting purposes. Also, another reason was the impossibility to close the monthly economic and financial statements faster than usually and this with significant efforts and overtime from the involved personnel. This problem has been noticed also by researchers on data, for example a survey requested by Oracle on the way organizations deal with the closing process revealed that more than 80% of them need almost one month (20 man-days) for doing it. This is caused by data quality issues and by the fact that data was received from several sources, implying almost always manual interventions, but no data lineage.

The unit A created a dedicated and complex structure, with multiple managerial levels and several roles related to data management, the most specific to the data governance being the Data Steward. The unit B identified as needed one single role - Data Officer - a consultant than an employee. B is focused on Data Quality and links it to the assignment of data ownership. In terms of staffing, the staff is not experienced in data management. Neither A nor B have preoccupations of bringing on board specialized staff in data management.

One unit, advanced in terms of governance, approved, at organizational level, a Data Strategy and an Operating model that introduce the data management activity in the middle of the data related processes. Through the Data Strategy, the health units become agile using data; they intend to become data-centered and embed this culture across the unit. The other one used the Parent Company Data Quality Guidelines – a misleadingly named document, although has a comprehensive chapter dedicated to data quality. In fact it establishes the roles and the adequate responsibilities such as: Data officer, Data owners, Data users.

In terms of the communication methods, i.e. the way in which data related activities are transmitted within the organization A has created data committees, with monthly and quarterly recurrence, where the participants are the heads of Administration / IT / Data Management division and Risk. Also,

when the new Data Management division has been created, a project kick off meeting was held with all the departments, for informing them about the new operating model. Several other presentations have been made to their personnel related to the Data Warehouse project and Business Intelligence planned developments. B does not use official committees or reports to the top management on data practices developments.

FINDINGS BEHIND THE WRITTEN WORDS

Although at least in one of the two health establishments significant efforts have been made in order to set up a proper governance of data, including documented procedure, hiring personnel and investments in data warehouse, with the purpose of it to become the unique source of data for official reporting, the 2018 year reality at two years distance since the project beginning shows that in practice, there is an almost zero “*evangelization*” in what regards the data centered mentality. More specifically, both health establishments continue to focus on solving isolated business problems, at the moment of their appearance. Even if the guidelines/policy state that any new project that might involve data-related aspects (data creation, data storage, data reporting, etc.) mandatorily involve Data Management division / the Data Officer, still disparate projects appear and are implemented, which shows that neither the staff nor the decision bodies are truly involved in a real transformation process through which the organization passes in order to become data-centered.

Although A invested in building a Data Warehouse and B created automated data recording as flows generated daily, harmonized and aggregated locally), there is a limited use of this data within the unit. During the implementation process, the administration departments involved in testing the data proved a low satisfaction because of the data used without any business intelligence tools and Data dictionary/IT glossary terms, the data processing was assessed as limited in accessibility and time consuming. On the other side, the unit B did not even popularized the daily created data tables. From the starting point, it was proved a limited involvement in the overall project requiring clarifications. Also, this so-called data storage which in fact is a golden mine, has no dictionary attached. The fields’ explanations suggest unclearly and incompletely, the data content.

The automation level is at an almost satisfactory level, in what regards the creation of “consecrated” reports; still, there are parts that require manual intervention. Neither the automated parts, nor the manual ones, have a proper documented flow. Data lineage is inexistent. The A hopes to solve the issue when migrating the main reporting on the data warehouse. The B intends to identify the lineage with the involvement of the Data officer and the Data owners. Also, there is no change in management standardization, and modifications to data and/or reporting are not documented, leading to the impossibility to identify errors and correct them in an efficient manner. Some of the staffs showed that

health premises spend disproportionate amount of time for maintaining and tuning the technology and infrastructure to meet the changing requirements, some of the applications are scarcely documented, maintenance agreements with providers is lacking, while the creation of new data fields are hardly done internally. The solutions provided informally, to avoid incurring significant costs, do not satisfy a proper management of data quality.

In terms of skilled staff involvement, both units stated that the data-centricity is built only by using the technical knowledge of the IT personnel and the business knowledge of employees from key administrative areas. The availability of qualified and creative staff is seen as one of the biggest problem in the attempt to increasing establishment's data capabilities. The health industry is hardly a pioneer in addressing data issues systematically and cannot be considered a source for data trained staffing. Industries like Pharma are more advanced and data modelers or architects are easier found. With relative knowledge related to health services and Medicare practices, they need stronger pair-teams of Data Owners, flexibility in mixing the field with technical specifications. Meanwhile, consultancy is a key approach, leading to reduced visibility of data-related activities. The underlying issue that is brought into light by all interviewed persons is the improper cross-functional practices: while teams are used to cooperate for designing operational business-based processes, the cooperation doesn't look fruitful. The main reason is that the roles and the responsibilities related to data have been assigned without proper explanations on purpose, destination, and activity to be done by data steward and data owner and how they will be assigned.

The unit A nominated only Data stewards, identifying three types of them: Data Domain Stewards – role associated to heads of divisions and managers, being responsible for ensuring the duality of data in their domain and for documenting data classification rules, compliance rules and business rules. Asked about how they play their role, managers complain that they do not know what “classification rules” means, that data compliance rules should come from compliance department or IT if it relates to technical aspects. With regard to data quality, they say that this is the appanage of the departments who handle the data in the system, business being responsible only to generating business and not to managing the data related to this business. The Technical Data Steward is the second type and his role is associated to the Data Management division. The responsibilities associated cover the creation and maintenance of Business Glossary, of the Reports catalogue and proposing Key Data Elements (KDEs) and Key Data Quality Indicators (KDIs). They confirm the absence of procedures or manual regarding KDE or KDI and look for other people like consultants to provide inputs on this. The third type refers to the Operational staffs, identified as the seniors of various departments. Their responsibilities, as per the Operating model, are linked to data quality issues, to ensure adequate solutions and participation at the glossary building, etc. All the respondents stated that have several times been asked specific

questions about the data and they provided the information; still, they never use the affairs glossary, not even for requesting a report – case in which they explain to IT department their needs in their own words, then verify the outcome and correct, again with IT help, any misunderstandings.

CONCLUSIONS

Significant efforts appear to be done by premises in order to improve the way they address data issue. Still, they lack overall engagement. One reason for this is that the governance rules are set based on research about best practices. What is found as necessary to be done is transposed into internal policies and procedures.

- With the best intentions, still without much success. Without specialized personnel, data approaches get dressed in new clothing, but remain carried on in traditional ways and by people who are used to deal with data from a technical point of view (IT, MIS personnel), from the financial or risk point of view, from reporting point of view, but not holistically. Data continues to be handled in a fragmented way and for specific purposes. The lack of inner interest in data quality comes at the surface especially when it is about assuming responsibility for data, when data needs ownership allocation, or when someone needs to be held responsible for a new reporting requirement.
- A traditional way of doing things cannot, by any means, be changed by a written procedure. The “written word”, the policy or a procedure, needs to be understood as a beneficial thing, in order to be accepted and implemented. This is most all valid when we refer, in our case, to data ownership.
- Both units created data domains and allocated the ownership (called ownership, or, in case of A – just stewardship) to the heads of the departments.
- Too vague to be accepted. Too limited to be applied.

The Data owner must be the person who – based on the specific responsibilities of its department – understand and inform others about the data meaning. Data ownership is linked to the concept of the data, and not to the form this data receives when registered in the health systems. A data owner is the one who will be responsible to understand any time a new legislative requirement generates a modification in the data, or an enhancement.

Any request related to reporting patient or customer’s data must be first studied by the Data owner. The documentation of the requirements describes the “concepts” to which data refers to.

A data owner needs to read the requirements, participate in meetings related to the subject, and once the “concepts” are clear, they need to “translate” everything in the language of the organization, giving a physical form to the data. Once the concept is clear the owner will define everything else needed: data quality, integrity rules, users' roles and access privileges (McDowall, 2017). If ones request that the data owner to be directly responsible for the quality of data, the attempt is prone to

fail.

Any Data Owner must always match a Data Steward. According to some authors, the Stewards implement the requirements of the data owners (McDowall, 2017), support business departments in using the data (Otto, 2011) and ensure the conformity with the policies or guidelines (Koltay, 2016). These stewards may belong to IT, or to back office type departments or offices. Let's take other examples of data. "Branch" is a concept. It refers to an organizational structure where services are offered to patients. To establish the ownership of this data, we must try to go as close as possible to the point where someone is entitled to decide upon the creation or the modification of the data. We might be tempted to decide that the Data Owner for the Branch concept is Network division and to find exactly the person responsible. Going farther we can understand who creates the real, "physical" data from this concept and who owns it. Usually, this type of activity is performed in IT, so we will have a "technical steward" that will be directly responsible for the data quality from the moment it is entered into the system; they will bring specific knowledge to any reporting requirements or data quality assessment. And if something is unclear, they will need to collaborate with the Data Owner, for a better understanding. The compounded data refer to the data exposure. Usually, the back office staff is involved in the original set up of data or in the modifications of the data when needed. They are not involved in reporting or calculations about exposures. This responsibility should belong to the ones who created the compounded data. Like Finance, or Risk.

We value and support Seiner's opinion who considers that a proper data governance is not so out of the ordinary as some may think: organisations should simply search for the people who already, in an informal way or simply as part of the daily routine, are already involved in the data related activities, are accountant for it (Seiner, 2014). Forcing structures to fit into unnatural roles will not bring any benefit to the organization. By creating teams of people who by the nature of their roles, are anyway responsible for the data, and formalizing this authority, can improve significantly the data quality, understanding and usage, avoiding what is usually incurred when the data is bad, or badly managed: poor business decisions (Stickel and Vandervalk, 2014). With respect to the usage, data is valuable, a strong asset, only if the organization uses it widely and reuses it smartly. To be used, data must be of high quality, poor data leading to poor usage and reducing the value of the company (Otto, 2011). Effective data governance leads to well-known data that allows proactive rather than reactive decisions (Stickel and Vandervalk, 2014) concerning data quality and leading to increased trust of the organization in its data.

ABSTRACT

Domestic violence, particularly violence against women, is registered in various countries; however, the degree of this phenomenon is predetermined by the level of development of social and economic institutions in a region. Gender-based violence implies the male-female inequality in terms of access to economic resources and involvement in social life. In Vietnam, the problem remains alarming and has a negative effect on different age groups.

The objective of the study is to assess the scope and institutional consequences of gender-based domestic violence in Vietnam.

Methods of GBV-based statistical data processing as well as analytical research methods were used.

The dynamics of domestic violence was determined, as well as the types and causes typical of this phenomenon in Vietnam were revealed. It was found that the degree of the domestic violence is correlated with the level of income. Since Vietnam is an emerging economy, the alleviation of inequality in male-female income ratio may appear to be a long term process. In Vietnam, elderly and uneducated women are subjected to domestic violence more frequently compared to other categories of the population. The percentage of rural women exposed to violence is higher compared to that of urban women. The detrimental effect of domestic violence is manifested in the gross domestic product losses and impediments to further development of the country. Institutional, legislative, and law enforcement actions (recommendations) pertinent to the prevention of domestic violence were proposed by the authors.

Keywords: domestic violence, gender inequality, gender-based violence, lifetime prevalence, involvement in the life of society, violence prevention institutions.

INTRODUCTION

Violence against women: United Nations Definition

UN 1993 Declaration on the Elimination of Violence against Women, in Article 1 and 2, states that

violence against women is any act of gender-based violence that results in, or is likely to result in, physical, sexual or psychological harm or suffering of women, including threats of these actions, coercion or arbitrary deprivation of liberty, whether occurring in public or private life. The Declaration also describes violence against women as: (a) physical, sexual and psychological violence occurring in the family, including battering, sexual abuse of female children in the household, dowry-related violence, marital rape, female genital mutilation and other traditional practices harmful to women, non-spousal violence and violence related to exploitation;(b) physical, sexual and psychological violence occurring within the general community, including rape, sexual abuse, sexual harassment and intimidation at work, in educational institutions and elsewhere, trafficking in women and forced prostitution; and (c) physical, sexual and psychological violence perpetrated or condoned by the State, wherever it occurs (UN, 1993).

Domestic Violence (DV) is defined in paragraph (a) of Article 2 of the Declaration as violence or other abuse by a person against another in a domestic setting. It occurs everywhere and affects everyone with no exception of age, social status, sexual orientation, gender, race, religion or nationality (NCADV, 2015). DV causes physical injury, psychological trauma and in many cases bitter end of life. The consequences of DV can be lifetime desolating and devastating for victims. As gender inequality is one of the biggest social problems, in most DV cases, women and girls are victims. Therefore, in many countries, DV is specified as violence against women.

Domestic violence as the most common epidemic around the world

Nowadays, DV is recognized by the international community as violation of human rights and discrimination against women. It causes damage to women and girls physical, psychological and reproductive health. Statistics of the World Health Organization's (WHO) 2013 Report show that intimate partner violence affects more than 30 percent of women worldwide and is the most prevalent type of violence against women (WHO, 2013, p.16).

WHO region	Prevalence %	95% CI*, %
Low-and middle-income regions:		
Africa	36.6	32.7 to 40.5
Americas	29.8	25.8 to 33.9
Eastern Mediterranean	37.0	30.9 to 43.1
Europe	25.4	20.9 to 30.0
South-East Asia	37.7	32.8 to 42.6
Western Pacific	24.6	20.1 to 29.0
High-income regions	23.2	20.2 to 26.2

Source: (WHO, 2013, p.17). *CI = confidence interval

Table 1. *The lifetime prevalence of physical and/or sexual intimate partner-induced violence among ever-partnered women by WHO region*

The prevalence of physical or sexual intimate partner violence presented in Table 1 shows that this prevalence is higher in the WHO low-income regions such as Africa (36.6%), Middle-East (37.0%) and South East Asia (37.7%), and lower in high-income regions (23.2%).

Heidi Stöckl and colleagues studied data on 492,340 murders from 66 countries and revealed that as a minimum one out of seven homicides (13.5%) is committed by an intimate partner in relation to partners who are responsible for 38.6% of all female homicides compared to only 6.3% of male homicides worldwide (Stöckl et al., 2013).

In Vietnam, according to the 2010 National Study on DV, about 58% of ever-married women experienced some form of violence in their lifetime (GSO, 2010, p. 51). All of the foregoing in turn affirms the obvious truth that DV is a pressing problem not only in Vietnam but also other developing countries. Hence, it can be considered as an epidemic that hinders the human and economic development of a nation.

PROBLEM STATEMENT

As stated by the United Nations, violence against women appears in physical, sexual and psychological forms. In Vietnam, DV is commonly known as abuse committed by male members of a family against their wives and/or girls. This phenomenon can also be referred to as gender-based violence; however in Vietnam, gender-based violence has a narrower scope (Jennifer J. K., Bhushan R. A., 2011, p.2). Article 1 of the law “On Domestic Violence Prevention and Control” states that “domestic violence is defined as purposeful acts of certain family members that cause or may possibly cause physical, mental, or economic injuries to other family members.” (ILO, 2008).

Furthermore, in Asia, DV also assumes one more form, i.e. economic violence, which is a type of abuse, when one intimate partner controls the access of another partner to economic resources (Adrienne et al., 2008). Apparently, this manifestation of violence is typical of not only Vietnam but also other middle-to low-income countries, where women and children’s life normally depends on men. As witnessed in many Vietnamese families, children are sometimes exploited by their own family members for the purpose of pressuring the mother and thus causing her physical and psychological abuse. This may even include physical and sexual abuse of children. Consequently, DV in Vietnam affects all aspects of women’s life and entails long-term institutional and social effects impeding further development of economy. Since, the consequences of DV threaten the stability of Vietnamese families and the sustainable development of the entire country; they, as well as their causes, require analysis and development of recommendations for DV prevention and control.

RESEARCH DATA

Previously, national level surveys and statistical reports on violence against women and children were limited. In 2006, the General Statistics Office (GSO), the Ministry of Culture, Sports and Tourism (MoCST), UNICEF, and the Institute for Family and Gender Studies conducted a national study, which showed that 21.2% of couples had experienced at least one type of DV, including physical, sexual, or emotional violence, over the past 12 months (MoCST&UNICEF, 2006, p. 40).

The National Study on DV against women in Vietnam was performed between December 2009 and February 2010 by the General Statistics Office (GSO) of Vietnam with technical support provided by the World Health Organization (WHO). Approximately 4,838 women of aged 18-60 were interviewed across the country, using the questionnaire of the WHO Multinational Study on Women's Health and DV against Women, which had been adjusted to the context of Vietnam. Data on physical and sexual violence with regard to education and age groups are presented in Table 2. Some percentages of violence against women by perpetrators other than husbands are also registered

	Physical violence		Sexual violence		Both physical and sexual violence		Number of ever-partnered women interviewed (N)

Table 2. The current rate of ever-partnered women exposed to either physical or sexual violence, or both physical and sexual violence, over the past 12 months and in a lifetime (%).

According to the data, approximately 10% of women have been physically abused by someone other than their husbands since they turned 15, with wide regional variation ranging from 3-12%; 65% of

women are victims of violence committed by perpetrators who are their male family members. Nearly 2% are reported to have fallen victims of violence since age of 15. Most women claim that the perpetrators were strangers and boyfriends, and barely ever were they those women's family members. 2.8% of all women are reported as victims of sexual abuse committed before age 15. Most women report that the perpetrators were strangers or boyfriends, and there were very rare cases when the perpetrators were family members. Thirty-five percent of all women in Vietnam have been exposed to physical or sexual violence committed by an intimate partner and/or non-partner in their lives. Prevalence of intimate partner violence is three times higher than non-partners violence (GSO, 2010, p. 194). Data from reports of The Ministry of Labour - Invalids and Social Affairs (MOLISA), The Ministry of Public Security are also used to confirm the statement.

Limitation of research data

Results of the first National Study on DV are partly outdated, but are still referred to. UN agencies, Vietnamese, and foreign researchers use these results in their studies. The next National Study on DV will start at the end of 2019.

Another factor that affects the accuracy of the DV data is that local authorities did not strictly followed the regulations related to the DV report. The conference that took place on December 12, 2018 and was to summarize the 10 years of the implementation of 2007 Law No. 02/2007/QH12 on "Domestic Violence Prevention and Control" (DVPC Law), 292,268 DV cases were reported by the MoCST in the period 2009-2017. However, according to the report of the Supreme People's Court of July 1, 2008 to September 30, 2017, among 1,220,163 cases processed by the Divorce Court, there were 1,050,687 DV induced cases, accounting for 76.6% of divorce cases (MoCST, 2018, p.14).

Common Types of DV in Vietnam

Psychological and physical violence

Psychological (emotional) violence is no less serious than physical or sexual violence. Specific acts of psychological abuse include: insulting or making harmful behavior; despising, humiliating in front of other people; threatening in any way (scolding or smashing things); threatening beating or beating; threatening to expel from the house for any reason. The results of study show that the prevalence of emotional violence is very high: 54% of women report lifetime emotional abuse and 25.4% report current psychological abuse over the past 12 months (Figure 1)

Sexual violence

Due to the old ethic norms of cultural and religious origin, it is difficult for Vietnamese women to disclose experience of sexual violence. Hence, speaking about sexual violence, while being in

marriage, is considered inappropriate, and, as a consequence, only 10% of ever-married women report that they experienced sexual violence in their lifetime.

Figure 1. Prevalence of ever-partnered women over the past 12 months and in a lifetime by types of violence; source: (GSO, 2010, pp.180, 188-189)

Economic violence

In the Vietnamese family, this type of violence is normally committed by men in the following formats: denial of the maintenance of children; concealment of income; spending family money only for own needs; independent adoption of most financial decisions; strict control over the expenses of family members, and others. In most cases, women depend on men economically for different reasons, viz. birth of a child, the husband's prohibition to work, unemployment, discrimination in the labor market, etc. Women, however, could also be victims of this violent type even though they work and make money. In the survey, consistent with the forms of economic violence, the current rate for economic abuse is 9 percent. The proportion of rural women experiencing economic violence is higher than in urban areas (9.6 percent and 7.4 percent respectively) (GSO, 2010, p.192).

Violence against children in families

Not only adults but also children are victims of DV. Acts of DV in relation to children, deeply affect the formation of children's personality, life view, and their behavior in society at later stages. AretiTsavoussis and colleagues found that children who witnessed DV demonstrate psychosocial maladaptation, which is associated with demonstrable changes in the anatomic and physiological make up of their central nervous system. The USA National Epidemiologic Survey on Alcohol and Related Conditions (NESARC) indicated that emotional neglect is the most common childhood-related manifestation of maltreatment (above 3.4–9.2%) (Tsavoussis et al, 2014).

DV is a major factor that undermines family values. Violence pushes families into crisis; nearly 80% of annual divorce cases are caused by DV (Chau, 2017). Abilities of violent family children are severely impaired; some of them tend to use violence when solving conflicts. This has been a major cause of school violence in the country in recent years. Nearly 23.7% of surveyed women, with children under 15, report their children to have been physically abused by their fathers (GSO, 2010, p. 208). The survey found that violence against children is strongly coupled with violence against women by the same perpetrator.

However, in the 2010 National Study on DV, which was based on reports of women aged 18-60; child abuse cases, including child sexual abuse (CSA), were only mentioned through the interviewees' responses and did not disclose fully the situation of child abuse as well as elderly women abuse.

	Total number of child abuse cases reported	Number of sexual abuse cases from the total of CSA	Percentage in comparison with the total of CSA
2011-2015	8,200; 10,000 victims	5,300	64.63
2016	1,641	1,211	73.80
2017	1,592	1,397	87.75
6 months of 2018	720	573	79.58

Source: MOLISA, 2016; MOLISA, 2018

Table 3. *The number of child abuse cases reported in 2011-2017 and the six months of 2018*

Although the number of child abuse cases, as reported by MOLISA in Table 3, tends to decrease, the Ministry of Public Security of Vietnam states that the number of registered child abuse cases is only a small fraction of reality: the majority of victims are girls aged 12-15 (57.4 6%). A heart-breaking depression for the entire community is that the number of children under 6 exposed to sexual abused is 13.2% (Do, V.T., 2018), and about 80% of victims are female (Nguyen, T.L., 2018). Tran, Thi Bich Ngoc et al. found that the rate of CSA cases had increased, displaying the danger of this form of crime. Most of the perpetrators appeared to be relatives or familiar with the victim, viz. 21.3% were family members (father, stepfather, adoptive father, brother, cousin, uncle); 6.2% were somebody related to school staff (teachers, caregiver, and school guard); 59.9% were other acquaintances (baby-sitters, or neighbors); roughly 12% were strangers (Tran, B.N. et al). Generally, the situation reflected by the figures above is an alarming bell for Vietnamese society.

THE KEY DISTINGUISHING FEATURES OF THE CAUSES OF DV IN VIETNAM

Vietnam is a developing country, so many people still experience economic difficulties, especially in rural and mountainous areas. Numerous studies show the causes of DV as the men' acts against women. Additionally, the thousand-year-old culture of Vietnam is intertwined in part with religious

theories of China and some other Asian countries, which cannot but affect the “shaping” of personality and individual behavior. From our perspective, the whole range of causes of DV in Vietnam can be classified as follows:

- Gender norms and gender inequality.

Vietnamese society is a deeply patriarchal society with a traditional view on gender, which stems from Confucianism and Buddhism. According to Confucianism ideology, men are respected, as they are bread-winners of families and are responsible for worshipping ancestors. Women play a passive role in families and should observe the “Three Obediences”: Women are to practice obedience to the father and elder brothers when young, to the husband when married, and to sons when widowed (Fu, 1974).

Boys are favored over girls in Asia, and Vietnam is tied up in the part of the Confucian belief that states that a male heir is needed “to carry on the family name”, lead the family, and take care of the family ancestors. The high imbalance of gender ratio at birth (SRB) in Vietnam (112.2 boys to every 100 girls in 2010-2017) also plays its part (GSO Vietnam, 2018, p.92). Moreover, Buddhism teaches people to be patient and considers patience to be one of the mental states that an awakened person attained to. According to the Pew Research Center data, in 2010 Vietnam had 14,38 million Buddhists (16.4% of the total population and 2.9% of the world’s total number of Buddhists (PRC, 2012). Obviously, women in Vietnam, who suffered from DV, often keep silent or just talk with their family members (Figure 2).

Source: (GSO, 2010, p. 213).

Figure 2. The proportion of women, who told someone about a case of violence they had been exposed to, among women who experienced physical or sexual violence caused by husband, Viet Nam 2010 (%) (N=1546).

The Vietnam Multiple Indicator Cluster Survey (2006) revealed that up to 64% of women age 15-49 perceive violent treatment from their husbands as normal. The percentage is high in rural areas (72%) compared to that in urban areas (42%) (UNICEF, 2007, p. 20). The figure decreased to 51.6% in 2010 (GSO, 2010, p. 199).

Women do not actively seek solutions to protect themselves. Most abused women (87.1%) never request help from formal services (police, healthcare or social facilities, local authorities, etc.) unless they find themselves in critical situations (UNWV, 2012, p. 14). Frequently, they do not feel supported because local officers still hold the perception that DV is a family matter.

- Lack of legal documents.

The lack of conformity among legal documents hinders the preventions and counteraction in relation to acts. For example, the DVCP Law does not explicitly call for criminal sanctions but is aimed at civil remedies (prohibition orders, fines as a public disorder, reconciliation and/or re-education). Article 134 of the Vietnam Penal Code 2015 deals with injury intentionally inflicted on or causing harm to the health of other individuals; however criminal prosecution has two conditions, i.e. the minimum degree of harm and the filing of charges required by victims and injury rate are determined by medical personnel. For example, Inter-Circular 28/2013/TTLT-BYT-BLDTBXH regulates the rate of bodily injury, illness and occupational diseases as of 27 September 2013. Therefore, an injured victim of DV prefers not to report to the police or apply to a health facility if their injury is not serious. Many provisions of the 2007 DVPC Law became obsolete and unreasonable, since other relevant laws were amended and supplemented, e.g. the Constitution (2013), the Civil Code (2015), the Vietnam Penal Code (2015), the Law on Marriage and Family (2014), etc.

- Social vices (alcoholism, drug use and gambling, adultery, etc.).

This is the most common cause because when social vices enter a family, they frequently entail marital and economic hardships; family conflicts lead to DV in turn. The most common causes of DV are alcohol (nearly 40%), family conflict (26.5%), and jealousy (9.3%)(GSO, 2010,p. 201). According to Deputy Minister MOLISA Nguyen Thi Ha, there are 222,852 drug users registered as of 2017 in the country (Nguyen, T.H., 2018). A related alarming problem in the country is that the use of synthetic drugs, containing methamphetamine among young drug addicts is increasing. Methamphetamine users suffer from hallucinations, which results in violent behavior in relation to family members or other people around them.

- Level of education.

Obviously, most women who experienced DV have a low level of education. 31.2% of 530 interviewed individuals did not attend school. 36.9% of 1,111 interviewees have primary education, and 33.9% of 1,725 interviewees completed secondary education (Table 2). Female workers have a lower chance of getting a well-paid job and thus cannot carry out themselves. Hence, Vietnamese women are more disadvantaged in economic equality due to differences in income levels between men and women. This also pertains to older-age groups of the population.

Consequences of DV

First, DV is known to induce enormous economic losses, including various expenditures on measures against DV consequences. Sylvia Walby distinguished the following three major types of costs: (1) services, including the cost of Criminal Justice System, Health Care, Social Services, Housing, Civil Legal, which are largely funded by the government; (2) economic output losses, sustained by employers and employees; (3) human and emotional costs, born by the individual victim (Walby, 2004). In Vietnam, it is estimated that the annual expenditures related to DV is 1.78% of GDP (UNWV, 2012, p.4).

Secondly, DV often causes victims serious consequences. Physical and psychological effects on women, who experienced physical or sexual violence committed by a close partner, can last for a certain period of time or for a lifetime, reducing their input in the community. Table 4 presents these rates based on the responses of interviewed women.

	No violence N=3012.(%)	Physical or sex. ViolenceN=1548. (%)	Ever-partnered womenN= 4560. (%)
Health status

GOVERNMENT POLICY TO PREVENT DOMESTIC VIOLENCE

As it was highlighted in the previous chapters, victims of DV are predominantly women. Since the late 1950s, Vietnam has paid much attention to the protection of women's rights and affirmed their role in social life. The 1959 Constitution of the Democratic Republic of Vietnam emphasizes that "Women in the Democratic Republic of Vietnam enjoy equal rights with men in all spheres of political, economic, cultural, social, and domestic life" (Article 24). This statement was employed in The Constitution of the Socialist Republic of Vietnam 2013, confirming the fact that the state, society, and family are to ensure conditions for the comprehensive development of women and promotion of their role in society; gender-based discrimination was strictly prohibited (Article 26).

Currently, the following main laws regarding the regulation of state policies on the protection of women's rights remain in effect:

- The Civil Code (Law No. 91/2015/QH13) confirms that all civil rights are recognized, respected, protected, and guaranteed under the Constitution and law (Article 39).
- The Vietnam Penal Code (Law No.100/2015/QH13) deals with injury intentionally inflicted on or causing harm to the health of other individuals (Article 134).
- Law on Domestic Violence Prevention and Control, 2007 (Law No. 02/2007/QH12). This law regulates the prevention and control of DV, protecting and assisting the victims of DV; the responsibilities of individuals, families, organizations, institutions in DV prevention and control as well as deals with the breach of the Law (Article 1).
- Law on Marriage and Family (2014) No 52/2014/QH1319. The Law determines that husband and wife are equal, exercising equal rights and obligations in all family affairs and in the performance of citizens' rights and obligations presented in the Constitution, this law, and relevant laws (Article 1).
- The revised Law on Gender Equality 2006 (No 73/2006/QH11) contains detailed provisions on gender equality, prevention of discrimination against women, as well as equal rights and responsibilities of sons and daughters. This law provides for gender equality, based on the following six principles: men and women are equal in all aspects of social and family life; men and women are not discriminated in terms of gender; the application of measures to promote gender equality is not considered as gender-based discrimination; policies on motherhood are not considered as gender-based discrimination; gender equality issues are ensured to be integrated in the process of law; exercising gender equality is the duty of agencies, organizations, families, and individuals (Article 6).

- The National Population and Reproductive Health Strategy for the period of 2011 – 2020 was approved by Decision №: 2013/QĐ-TTg on November 14, 2011. The main objectives of the Strategy are to reduce level of SRB below 113 by 2015, below 115 by 2020 and 105 - 106 by 2025.

- The Vietnam Family development Strategy through 2020, with a vision toward 2030, approved by Decision №. 629/QĐ-TTg on May 29, 2012. According to the Strategy, by 2015 and 2020, respectively, 90% and at least 95% of households will have been informed on and conformed to policies and laws on marriage and family, gender equality, DV prevention and control as well as prevention of social vices from penetrating families; respectively, 90-95% of young people will be provided with the basic knowledge about family along with DV prevention and control prior to getting married; the number of households involved in DV will annually reduce by 10-15% on average; the number of households with members involved in social vices will annually reduce by 10-15% on average.

- The National Plan of Action on Domestic Violence Prevention and Control up to 2020, approved by the Decision №. 215/QĐ-TTg on February 6, 2014. The objectives of the Plan are to coordinate actions of government agencies and social organizations; to boost the quality and effectiveness of DV prevention and control activities; to generate fundamental changes in DV prevention and control work; to protect and support victims of DV; and to gradually minimize DV incidents nationwide as well as to provides the legal documents aimed at the effective execution of DV prevention and control activities in Vietnam.

The Project on Behavior Change Education on Family Building and Domestic Violence Prevention and Control up to 2020, approved by Decision №. 2170/QĐ-TTg on November 11, 2013. The objectives are to provide knowledge and skills to build a prosperous, progressive, and happy family and thus to prevent DV for 80% (by 2015) and 95% (by 2020) of total number of the learners, teachers, and administrators of educational facilities; to include Behavior Change Education in training programs.

As a result of community efforts and the impact of state policy, DV is decreasing in Vietnam.

Figure 3: *The number of DV cases in 2009-2017*

Legal advice plays an important role in relieving inhibition and improving psychology in abused people. According to the Ministry of Justice report, from 2008 to 2017, the Legal Aid Centers assisted 1,099,270 people, of which 508,443 were women (46.25%) (MoCST, 2019, p. 4). A Reliable Address model and a “Shelter” model organized by the Women's Union with nearly 30,000 addresses nationwide act as essential social and economic institutes designated to protect women from violence, to disseminate knowledge and professional life skills, as well as let them know their basic rights (Nguyen, T. C., 2018).

RESULTS AND CONCLUSION

Thus, the prevention of DV in Vietnam attracts attention from the society. Apparently, there has been improvement in social awareness. The emergency hotlines of the National Domestic Violence Prevention Program (1-800-799-SAFE (7233) or TTY 1-800-787-3224) (CFCD, 2014) and shelter models in many provinces and cities for abused women have also been established (UNWV, 2012, p.17). Statistics show that DV in Vietnam is under control and tends to decrease.

	2012	2013	2014	2015	2016	2017	2018*
Domestic violence type							
Psychological	14.700	10.761	8.272	6.755	5.568	5.171	2.796

Table 5. DV cases by type, sex and age reported in the period 2012-2018; *data for the 1-st half of 2018

The data presented in Table 5 cannot be sufficiently accurate for two reasons: (a) victims try to hide violence occurred in their family; and (b) there are province and city authorities who do not follow the regulations of statistics report on DV, assuming that the local image and reputation of their localities may be lost by public indignation and critique.

Studying the issues of DV in Vietnam in comparison with similar problems in the world, we found that the situation of DV in Vietnam is still a serious problem, causing concern for the community. The percentage of women exposed to DV (35%) is rather high in Vietnam, which is lower than in Southeast Asia (37.7%) and higher than in the western Pacific (24.6%) and high income countries (23.2%).

Presuming that addressing DV must be based on the consideration of direct or indirect causes of this phenomenon, the following measures were distinguished and suggested as being of high impact and value:

- Organization of community- and nation-level seminars and talks on the main causes of domestic violence, awareness-raising campaigns, the concept of gender equality rights and the basic contents of the DVPC 2007, Law on Gender Equality 2006 and Law on Marriage and Family 2014, using public and local mass media. This measure may prove to be effective not only in Vietnam but also in other countries.
- Introduction of comprehensive age-appropriate sexuality education and programs aimed to raise the awareness of parents and children of elderly parents, development of healthy masculinities.
- Funding of educational programs and professional training courses aimed at social workers with regard to their professional activity that involves individuals of all ages and genders. Social workers should be trained properly to be able to educate and facilitate girls, women, and elderly people, paying attention to the special needs and potential of these groups of the population.
- Mobilization of all people, especially men and authorities at all levels, representatives of the Trade Union and Women's Union of all levels to participate in anti-gender-based violence campaigns.
- Enhancement of the role women at all levels to ensure the prevention and control of domestic violence along with the promotion of the Reliable Address model and a "Shelter" model organized by the Vietnam Women's Union.
- Since there is a relationship between gender inequality and poverty, and poverty as well as the low level of education are viewed as the primary causes of gender-based violence, improvement of the people's living standard and the level of education should become the key social policy of the state.
- Further implementation of the National Target Program for Sustainable Poverty Reduction in 2016 – 2020 and accomplishment of the main program targets: to reduce the rate of poor households nationwide to approximately 1-1.5% per year (particularly, to reduce the rate of poor districts and communes to approximately 4% per year and that of poor households in ethnic minority areas to approximately 3-4% per year.

- Ensuring equal access to education, especially with regard to ethnic minority people, children of poor families, girls and the disadvantaged; achievement of gender equality in general education and tertiary education; development of education in ethnic minority, deep-lying and remote areas; implementation free tuition, school fee reduction or exemption, scholarship and other types of financial aid for poor students and ethnic minority students.

- Integration of solutions to poverty issues and gender equality into other long-term national socio-economic development programs and establishment of institutes of development.

- Revision of the law on Domestic Violence Prevention and Control to (1) make clear the law's intent, which is to prevent all forms of DV with the aim of maintaining family solidarity, preventing and eliminating DV acts; (2) introduce an amendment related to measures for the prevention of violence against elderly women and men; (3) align related decrees, decisions and directives adopted after the Law on Domestic Violence Prevention and Control, harmonizing punitive measures to be in conformity with the Gender Equality Law, the Law on Family, and the revised Penal Code; (4) combine the clear definitions of GBV and arrange regulations on sexual violence in line with international standards; (5) introduce programs inducing a change in psychosocial behavior of perpetrators of physical violence; (6) restrict the use of administrative (monetary) sanctions in lieu of sentencing and ensure that all monetary sanctions (as part of sentencing) directly come from the perpetrator's assets, not from the family's budget; (7) define the responsibilities of judicial agencies and public security systems of all levels to improve their efficiency.

Establishment of a database on DV and provision of quality data, which requires close coordination of government and non-governmental service providers and responsible agencies, e.g. cooperation of the healthcare sector, the sector of education, educational sector, the sector of economics and social development, courts, police, local people committees, non-governmental organizations, the Trade Union, and the Women Union of all level; full budget allocation and determination of responsibility of ministries and local authorities; specification of the types of data, reporting forms, and time of report.

ACTIVE LEARNING IN ACCOUNTING EDUCATION: A POSSIBLE CONNECTION USING TEACHING PERSPECTIVE INVENTORY?

Nicoliello, Mario

University of Pisa, Italy

ABSTRACT

In last years, each teacher must rethink his role, questioning the world with which he prepares his teaching and relates to the classroom with the students. From the formation of the syllabus to the exchange of opinions with colleagues, many operations become strategic in order to realize this new innovative way of teaching-learning.

Many aids were proposed, including the tool of the Teaching Practices Inventory, a list of good actions proposed by Wieman and Gilbert (2014) and tested with excellent results in the teachings of Science, Technology, Engineering and Mathematics (STEM).

The objective of this paper is to understand whether the Teaching Practices Inventory tool can also be used in the field of account teaching. To this end, with a narrative research methodology, the TPI will be analyzed and then linked with the peculiarities of Accounting Education.

Keywords: Active Learning, Accounting Education, Teaching Practice Inventory

1. INTRODUCTION

Moving from the Bologna Agreement (1999), a new process started with the aim to improve the effectiveness and efficiency of higher education in Europe in the context of a common European Higher Education Area. As part of this process, all third level institutions throughout the EU are being asked to write their programmes and modules in terms of learning outcomes in preparation for a change over to the student-centred European Credit Transfer System (Limerick University, 2008).

In this vision it is necessary to integrate teaching and learning: the teaching consists in encouraging the student to use learning actions that achieve the expected results. In other words, teachers need to know how students learn, to support appropriate learning activities and discourage inappropriate ones.

In this scenario, each teacher must rethink his role, questioning the world with which he prepares his teaching and relates to the classroom with the students. From the formation of the syllabus to the exchange of opinions with colleagues, many operations become strategic in order to realize this new innovative way of teaching-learning.

Many aids were proposed, including the tool of the Teaching Practices Inventory, a list of good actions proposed by Wieman and Gilbert (2014) and tested with excellent results in the teachings of Science, Technology, Engineering and Mathematics (STEM).

The objective of this paper is to understand whether the Teaching Practices Inventory tool can also be used in the field of account teaching. To this end, with a narrative research methodology, the TPI will be analyzed and then linked with the peculiarities of Accounting Education.

2. THEORETICAL BACKGROUND

It is now a common opinion and widely spread in literature that Accounting is going through a phase of suffering. Some authors (Baruch Lev and Feng Gu, 2016) have even wondered if Accounting is dead, others have pointed the need to rethink the entire university education so as to better orient it to the needs of the practice.

Other authors have studied those who will constitute the teaching class of the future: the current PhD candidates in Accounting. "Are accounting and finance academics a dying breed? Or will today's PhD students secure the next generations?" With these questions, Vivien Beattie and Sarah Jane Smith begin their book dedicated to Accounting doctorates in Great Britain. They ask whether the current PhD students will be the future generations of accounting academics, or if they are a dying breed.

In this general rethinking of the role of Accounting, someone tried to question about the new functions of Accounting Education.

In fact, Accounting education currently runs the risk of not understanding the reality of accounting practice and potentially giving up great opportunities regarding data and analytics take over, by letting other organizational functions, such as IT and marketing (Payne, 2014).

Therefore with a comeback to the origins of teaching, with a discussion about the new ways to train the teaching staff, the Education returned to the center of the scene.

According to Gragg (1940), teaching is a social art that necessarily involves relationships among people. The success of teaching depends upon a quality or attitude of mind that enables the teacher to make the relationship between teacher and student a reciprocal one. Thus neither all the teaching should be done by the teacher, nor all the learning should be done by the student.

Over the past several years, there has been a resurgence of interest in teaching not only in Accounting field and in the University context, but even in adult education and in general in the higher education.

According to Pratt, Collins and Jarvis-Selinger (2001), in adult education, this can be seen in the increased presence of papers on teaching within the proceedings of adult and higher education associations in North America, Europe and Australia. Within higher education this resurgence is

evident in the emergence of centres for faculty development and teaching at colleges and universities around the world. Once again, teaching has reclaimed a place of honor in adult and higher education.

At the same time, there is a call for teachers to be critically reflective in their practice of teaching, because professions have pushed for their members to reflect critically on the underlying assumptions and values that give direction and justification to their work. For many teachers this is not an easy task (Pratt, Collins and Jarvis-Selinger, 2001).

What does it mean to teach? What are the values underlying the teaching? How do teachers approach students? What is the impact of society on the subject taught? There is a series of questions that each teacher begins to ask himself to understand if his style of teaching is in line with the times. Teachers want to reflect on who they are and how they teach but with an implied message that that reflection should conform to some preconceived notion of a "good" teacher (Collins and Pratt, 2010).

3. LITERATURE REVIEW

Over the years, researches about Accounting Education focused on different issues concerning teaching and learning of Accounting in universities.

Works of international scholars have involved mainly the following areas (Paisey and Paisey, 2004): undergraduate and postgraduate courses, teaching programs, teaching methods, characteristics of students and teachers, student selection and subsequent employment at the end of the university course, relationships between teaching and professional issues. Therefore Accounting Education is a field of research very flourishing, and many scientific journals are born on this field (*Accounting Education, Advances in Accounting Education, Issues in Accounting Education, Journal of Accounting Education*, etc). Research topics are varied over time and over the years have also intensified periodic surveys of the literature (Rebele et al., 1991; Rebele et al., 1998; Apostolou, Watson, 2001; Watson, 2003 and 2007; Apostolou et al., 2010).

Many authors have questioned over the years on new teaching methods, proposing different reading keys. Thomson and Bebbington (2004) asked an interesting question: It does not matter what you teach?, while Boyce (2004) suggested that accounting education reform needs to go well beyond the putative reform agenda of the organised professional accounting bodies. Always Boyce, with Williams, Kelly and Yee (2001) questioned about the traditional teaching methods concluding that they lead to learning behaviours that are inconsistent with the development of generic skills (Inman et al., 1989; Gow et al., 1994). This suggests that student approaches to learning can be modified by specific learning situations and teaching strategies (Schmeck, 1983; Beattie et al., 1997). Accounting educators must focus on generating appropriate attitudes, including tolerance for uncertainty and ambiguity; willingness to deal with complexity and confusion, acceptance of conflicting information,

courage to take risks, and a fundamental desire to enhance thinking and problem-solving skills (Rubenstein, 1975; Crow, 1980). It must be recognized that the real problem for accounting education is not student attitudes and strategies per se. It is the extent to which preferences and associated strategies are challenged and modified by teaching and assessment strategies which students encounter (Boyce et al 2001).

These aspects exceed the boundaries of the accounting and match all the field of Education. In fact, nowadays we are asked more and more how to model the teaching on the new needs of students and concrete reality. Teachers are therefore doubtful and continually question themselves on their way of teaching. Paths have emerged in all areas of knowledge aimed at teaching teachers how to teach.

Several authors wrote about the new challenges of teaching, focusing on different aspects: the innovation of learning teaching methodologies by an active learning (Kuhn and Dean, 2004; Coryell, 2017), the learning skills also in relation to life and professional contexts (Le Boterf, 1994), the digital culture and the need for e-learning teaching (Ala-Mutka, 2011), the new permanent assessment, widespread and participated (Sambell, 2011; Nicol et. al, 2014).

Particular emphasis should be put on the role of Universities in the drawing of teaching and learning skills of professors, in view of the development of innovation processes of teaching (Yerevan Conference, 2015; EUA, 2015). In particular, European Union has set itself a lot of educational goals for the following years. In particular: to give incentives to institutions and teachers to commit themselves to innovate their teaching by creating learning contexts focused on the student and using digital technologies; to promote a closer link between teaching and learning and research at all levels of study; to recognize and encourage quality teaching; at the same time offer opportunities for skills improvement teaching staff; to involve students actively in the design of the courses study and quality assurance.

Many working team have produced works about the future challenges in teaching. The team Fostering Quality Teaching in Higher Education (OECD, 2012) wrote that the centrality of teaching is in the relationship between teaching and learning, therefore it is urgent to support the quality of teaching through the commitment of states and universities. High Level Group on the Modernisation of Higher Education (EU, 2013) wrote that public authorities responsible for high-level education should support universities to improve the quality of teaching and every institution should develop a strategy to improve the learning, giving the teaching the value of the research. The team Modernisation of Higher Education in Europe (by Eurydice, 2017) wrote that universities should support their teachers in increasing their teaching skills, appreciating the more worthy ones, so that all academic staff in 2020 should have received a certified pedagogical training.

The high professionalism of the teacher is a primary and indispensable factor for good learning

and effective teaching. The most prestigious universities in the world (Harvard, Berkeley, Cambridge, Oxford) have developed specific structures, generally called Teaching Learning Centers (TLCs), with the aim of developing research in the field of teaching and to raise the quality of teaching, enhancing the professional communities and increasing the teaching skills of individuals and groups.

Investment in university teacher training has long been a key strategic choice in almost all countries (Spain, France, Holland, Sweden, Finland, etc). In Sweden, Norway, the Netherlands, Great Britain, Latvia it is mandatory to have an initial IET certification (Initial Entry Training) to preserve university teaching assignments.

The training of newly hired teachers is a widespread practice (Austin et al. 2007; Gappa et al., 2007). These training programs aim to promote in the professors the skills of designing, choosing and conducting methodologies and technologies to encourage and evaluate learning, to manage partnerships with students.

In this scenario, other Authors have proposed a lot of means in order to form teachers. Huston and Weaver (2008) wrote about the Peer Coaching (reciprocal or one-way with consultation of the request, observation, debriefing and feedback), Boyer (1990) proposed the SoTL, i.e. Scholarship of Teaching and Learning, in three steps: reflection, investigation-research, sharing with the wider community. Cox (2004, 2013) launched the FLCO, i.e. Faculty Learning Communities, building a community (6-15 members) in which propose an annual, active and collaborative program focused on improving teaching and learning, with seminars and activities of reflection and research.

4. THE CONTEXT

In May 1998 the ministers in charge of higher education of France, Italy, the United Kingdom and Germany signed the so-called Sorbonne Declaration on the “harmonisation of the architecture of the European Higher Education System” at the Sorbonne University in Paris. Other European countries later subscribed to the Declaration.

The Sorbonne Declaration focused on a progressive convergence of the overall framework of degrees and cycles in an open European area for higher education; a common degree level system for undergraduates (Bachelor’s degree) and graduates (Master's and doctoral degree); enhancing and facilitating student and teacher mobility (students should spend at least one semester abroad); removing obstacles for mobility and improving recognition of degrees and academic qualifications

The Dublin Descriptors are the cycle descriptors (or “level descriptors”) presented in 2003 and adopted in 2005 as the Qualifications Framework of the European Higher Education Area. They offer generic statements of typical expectations of achievements and abilities associated with awards that represent the end of each of a Bologna cycle or level. The descriptors are phrased in terms of

competence levels, not learning outcomes, and they enable to distinguish in a broad and general manner between the different cycles. A level descriptor includes the following five components: knowledge and understanding; applying knowledge and understanding; making judgements; communication; lifelong learning skill.

In the context of the European Qualifications Framework, skills are described in terms of responsibility and autonomy, are related to the course of study and can be expressed with disciplinary Dublin descriptors.

From this path descends an educational program of teaching that should take into account both the *teaching objectives* and the *learning outcomes*.

The specific training objectives of a course of study indicate which educational project is intended to be proposed and serve to present the course on the outside. It is therefore necessary that they be written in a clear, concrete and timely manner, avoiding, on the one hand, exaggerated technicalities and, on the other, purely advertising formulations. The specific training objectives are a declination and clarification of the objectives of the class; in drafting it is therefore necessary to avoid the two opposite risks of a pedestrian repetition of the qualifying training objectives of the class and of a total deviation from these objectives.

According to Moon (2002), the usefulness of the formative objectives consists in providing a clear picture of the outgoing professional figure and of the training path that prepares it; indicate the progression of the route; develop collaborations with similar paths in other institutions; offer references to external stakeholders who want to know the route; constitute the starting point for the design of the individual lessons and their harmonization; to map knowledge, skills and competences to be developed in the curriculum

Learning outcomes, on the other hand, are the description of what a student should know, understand and be able to demonstrate at the end of a learning process. They are also related to the individual teaching and can be reached and are measurable (theoretical knowledge and practical-methodological skills applied)

According to Moon (2002), learning outcomes: clarify expected knowledge and skills; make students aware of what is expected of them; offer information that meets students' expectations; specify the relationship between the expected standards of the individual teaching and the level descriptors; they are a means of indicating the link between their learning and evaluation; they represent the "showcase" information also for other teachers, students, stakeholders; they can help in measuring the teaching load; they can be benchmark parameters between similar teachings.

Since learning objectives and results represent two complementary perspectives, an integrated approach is successful and consistent with the student-centered perspective.

Consequently, both the initial general definition of teaching objectives and the learning outcomes that specify the general objective and the different levels of learning processes should be used in the construction of each syllabus.

The whole system should aim at a *constructive alignment*, i.e. a design approach that optimizes the conditions for quality of learning, by constructing a coherent teaching environment in which teaching modalities and assessment practices are aligned with the aims of teaching.

By adopting the constructivist approach, students construct meanings through relevant learning activities. If the expected learning outcomes have been clearly communicated, students are more likely to feel motivated towards the contents and activities planned by the teacher to facilitate their learning.

The teacher prepares a learning environment that supports the appropriate learning activities to achieve the intended learning outcomes. The key point is that the components of the teaching system – in particular the teaching methods and the evaluation tests – are aligned with the learning activities presupposed by the expected results (Biggs & Tang, 2007; Zaggia, 2008).

Thus we enter the world of active learning, a new way of conceiving the world with which a student must stay in the classroom.

Analysis of the literature suggests that students must do more than just listen: they must read, write, discuss, or be engaged in solving problems. Most important, to be actively involved, students must engage in higher-order thinking tasks such as analysis, synthesis, and evaluation (Bonwell, & Eison, 1991).

Active learning increases conceptual and problem-solving test scores in physics (Hake, 1998). Small group learning produced higher achievement test scores, positive attitudes, higher levels of persistence in STEM courses (Springer et al. 1999). The data suggest that STEM instructors may begin to question the continued use of traditional lecturing in everyday practice, especially in light of recent work indicating that active learning confers benefits for STEM students from disadvantaged backgrounds and for female students in male-dominated fields (Freeman, et al., 2014).

Generally the lecture begins with general principles and eventually goes into detail with its applications. Instead, if the instruction begins with observations, book reviews, literature studies, site visits (on site instruction), case studies, etc., solving of a live example, giving solutions, would be a preferable alternative in the teaching and learning process (Gayathri & Champa, 2014).

According to Eison, 2010, in interactive lectures, instructor talks with periodic pauses for structured activities; as student concentration begins to wane, a short structured in-class activity is assigned; instructor's questions require responses; students' responses to an instructor's questions are commonly made by using a clicker or some other interactive response system; student-to-student talk is encouraged; students often work with partners or in groups; student comprehension during the

lecture is assessed directly; opportunities to correct misunderstandings are periodically provided within the lecture; high rates of attendance often are reported.

The teacher's effort to adapt to this new way of learning must be considerable, because to achieve active learning, teaching must also be innovative.

In this scenario, a valid help tool for teachers can be the Teaching practices inventory.

5. THE TEACHING PRACTICES INVENTORY: AN OVERVIEW

The Teaching Practices Inventory (TPI, formerly called the "Teaching Practices Survey") was designed to characterize the teaching practices used in undergraduate science and mathematics courses. The inventory provides a detailed characterization of practices used in all aspects of a "lecture" course. Proposed by Wieman and Gilbert, TPI has been tested with several hundred faculty members at UBC and refined over a 6-year period, the last in 2018.

According to Wieman and Gilbert, an inventory can characterize the teaching practices used in science and mathematics courses. This inventory can aid instructors and departments in reflecting on their teaching. Authors show how the inventory results can be used to gauge the extent of use of research-based teaching practices, and the high degree of discrimination provided by the inventory, as well as its effectiveness in tracking the increase in the use of research-based teaching practices (Wieman and Gilbert, 2014).

To create the inventory, Wieman and Gilbert devised a list of the various types of teaching practices that are commonly mentioned in the literature. They recognize that these practices are not applicable to every course, and any particular course would likely use only a subset of these practices.

The items on the inventory are divided into eight categories:

- Course information provided (including learning goals or outcomes)
- Supporting materials provided
- In-class features and activities
- Assignments
- Feedback and testing
- Other (diagnostics, pre–post testing, new methods with measures, etc.)
- Training and guidance of TAs
- Collaboration or sharing in teaching

They use the term "inventory" in its conventional meaning of a list of all items present, in this case a list of all the teaching practices present in a course.

According to Wieman and Gilbert (2014), the inventory will be valid for use in other disciplines, at least in the engineering and social sciences. This is based on their impression that the teaching

practices used in these disciplines are rather similar to those used in math and science. It would be straightforward to check that the wording of the items would be correctly interpreted by instructors from those disciplines and that the inventory includes the teaching practices used in those disciplines (Bransford et al., 2000; Pascarella and Terenzini, 2005; Ambrose et al., 2010).

6. TPI IN ACCOUNTING EDUCATION

In this phase of the work we will try to connect the TPI to the world of Accounting Education, analyzing them point by point.

A) Course information provided to students via hard copy or course webpage

This category responds perfectly to the scheduling needs of the Accounting courses, because in the courses of this Area students must be presented in addition to the list of topics to be covered, also the list of specific competencies such as skills and expertise that students should achieve. An accounting professor must therefore ask himself, when planning his teaching, what students should be able to do. In the field of Accounting, the list of competencies that are not topic related is also important, because students must acquire critical thinking and problem solving skills. Finally we need to work on the affective goals, ie on the changing students' attitudes and beliefs, preparing on aspects such as interest, motivation, relevance, beliefs about their competencies. Ultimately, the accounting teacher must make the student understand how to master the material.

B) Supporting materials provided to students

The Accounting teacher should check all that occurred in his course. For example, the performance of homework, whose solutions must always be provided to students, is indispensable in a subject with high practical implications such as accounting. In addition to these, students worked examples and previous year's exams, as well as articles from related academic literature. For the teaching of the Accounting the material of support to the lessons should be well evaluated, for example it could be the case of lecture notes or course PowerPoint presentations, but also of animations, video clips, or simulations related to course material.

C) In-class features and activities

An Accounting course becomes successful if it is participatory, so in the baggage of a teacher's teaching practices there must be some indispensable tools, to be used during the lesson. For example, pause to ask for questions, have small group discussions or stimulate reflective activity at the end of class.

In order to involve the student it is essential to make him feel at the center of the lesson and then to understand which method is used to collect responses from all the students in real time in class.

D) Assignments

Assigning homework can be a good practice to allow the Accounting course to be more participatory.

Homework can be managed in different ways. For example, they may or may not contribute to the course grade, or they can lead to the drafting of a paper or project, or they can still be done individually or in groups. Considering the peculiarities of the accounting it would be better if the tasks were carried out with high frequency (every week) and that they are pro-authoritative to the final exam, but they do not influence the evaluation.

E) Feedback and testing; including grading policies

Getting feedback from students during the term is a good practice, better if the assessment takes place not only at the end of the course, but also halfway through the course. In this way there can be a way to correct what the students did not judge positively during the course of the work.

Another good practice in the field of the Accounting is to design the course considering a series of tests during the term that reflect course expectations.

Obviously everything that is done during the term must be considered in the final evaluation (midterm exam, homework assignments, paper or project). It could be questioned whether the evaluation should also influence the in-class activities, participation and any Lab component.

F) Other

During an Accounting course it is good to leave some opportunities for students' self-evaluation of learning, but above all new teaching methods or materials should be used to measure their impact on student learning.

G) Training and guidance of Teaching Assistants

In the lessons of Accounting the best thing would be to choose as a Teaching Assistant a professional or an accountant who knows the matter in person, and he is able to explain the practical implications. In this way, while the teacher would focus on the theoretical aspects, the assistant would go more on the practice. The exercises should be on a weekly basis and linked with the lessons.

H) Collaboration or sharing in teaching

The thing to be avoided is that in a university every teaching of Accounting is different from the others. So the different teachers should coordinate the program of the course, the contents, the methods of conducting the lessons and the exercises

Therefore it is a good practice to use or to adapt materials provided by colleague, or to use departmental course materials that all instructors of this course are expected to use. It is also recommended to discuss how to teach the course with colleagues and read the literature about teaching and learning relevant to this course in order to get and share new ideas about teaching.

7. DISCUSSION

This work wanted to make an attempt to bring the Teaching Practices Inventory tool into Accounting Education.

This tool is a way to help the teacher in the perspective of innovative teaching, which is perceived as added value by the students. To this end there must be a constructive alignment between teaching objectives and learning outcomes, and even a new active learning is necessary.

More generally it is thought that teaching should be placed at the center of the village, or at least considered as research.

Lately, in fact, the research is experienced as a social and public event, realized in a group, it is a recommended choice, it is primary and decisive for the career, it is evaluated and appreciated. In other words, research expertise is prepared and guarantees prestige to the teacher and to the university.

This hyper-valuation of research probably corresponds to a devaluation of the teaching.

In fact, teaching is a private matter carried out in one's class and in solitude by the teacher, it is an obligation, requires commitment and takes time away from research, it is evaluated but not appreciated. Ultimately, the teaching competence is given for acquired and offers the public image of the teacher and the university.

It is believed that teaching and research are essential and determining functions for the life of the academy. According to Boyer (1990), the work of the professor would be thought of as having separate, yet overlapping, functions. These are: the scholarship of discovery; the scholarship of integration; the scholarship of application; and the scholarship of teaching. Therefore, excellence exists in all aspects of academic work. Teaching and research are indispensable components of teacher's professionalism.

8. CONCLUSIONS, LIMITATIONS AND FUTURE DEVELOPMENTS

The global digital revolution has irrevocably transformed societies and industries. Even the accounting profession is predicted to experience a significant change in the future, due to technological developments. Practices will be automated and related positions will become obsolete, thus accounting graduates need to be educated for new and different tasks and positions (Al-Htaybat et al. 2018). New technologies are expected to and are already changing accounting education, the way in which teachers have to teach the Accounting. For this reason teachers are called to reflect heavily on their way of teaching and to rethink their approach with students. A good way to start again on this path to redesign their style is to analyze their teaching perspectives. From this point of view, the TPI can be a useful tool for support.

This paper was intended to be a first exploratory attempt to introduce the concept of TPI in the accounting education literature, because TPI has a useful application well beyond a simple exercise in self-examination and values clarification among adults who hold varieties of teaching responsibilities. TPI could be a powerful tool in faculty development, teaching assessment, teaching improvement and peer reviews of teaching.

This work has tried to fit into the previous literature, trying to make a step forward to the studies. Thus connecting to Veenman (1984) and Grossman (1992), the work has tried to focus on the training of newly recruited teachers, who thanks to the TPI can verify their own knowledge.

Following the call of Hubbal et al. (2005) and Collins and Pratt (2011), the work has included the TPI in a new field of teaching, that of accounting. In particular, this work has been inserted in the field of Accounting Education, proposing a tool capable of increasing the quality of teaching and making the Accounting teacher an innovator, following what was proposed by Watty (2005) and Watty et. al. (2016).

Finally, we think that by using TPI Accounting Education could: a) draw a new direction for his future (Burnett, 2013); b) bring together the interest of the entire teaching faculty around a topic of training (Fogarty et. al., 2016); c) find a new tool able to focus the teacher on the needs of the world of work (Jackling and Delange, 2009).

The limitation of this work are mainly related to the methodology: the case could not be generalized. In order to remove this limitation, the future developments could affect the generalization of results to other fields, presenting some new experiences on the use of TPI.

TEACHING PERSPECTIVES INVENTORY IN THE ACCOUNTING FIELD: A FIRST EXPLORATORY ATTEMPT

Nicoliello, Mario

University of Pisa, Italy

ABSTRACT

The works by Pratt and Collins developed a contemporary and easily self-administered teachers evaluation instrument called the Teaching Perspectives Inventory (TPI), a tool broad applicability to a range of education contexts.

The TPI differentiates between five perspectives on teaching: Transmission, Developmental, Apprenticeship, Nurturing, and Social Reform. Each perspective incorporates fundamental beliefs about teaching and learning, instructional intentions within teaching contexts, and concrete actions. The development and use of the TPI has undergone rigorous testing with a wide range of practitioners, educators, and student teachers.

The aim of this work is to insert the TPI in the Accounting Education, trying to understand if the perspectives are applicable to the accounting discipline.

After the highlight of the TPI framework, the paper uses a narrative inquiry research method in order to introduce the TPI in the Accounting field.

Keywords: Teaching Perspective Inventory, Accounting Education, Teaching, Learning, Narrative Inquiry

1. INTRODUCTION

It is now a common opinion and widely spread in literature that Accounting is going through a phase of suffering. Some authors (Baruch Lev and Feng Gu, 2016) have even wondered if Accounting is dead, others have pointed the need to rethink the entire university education so as to better orient it to the needs of the practice.

Other authors have studied those who will constitute the teaching class of the future: the current PhD candidates in Accounting. "Are accounting and finance academics a dying breed? Or will today's PhD students secure the next generations?" With these questions, Vivien Beattie and Sarah Jane Smith begin their book dedicated to Accounting doctorates in Great Britain. They ask whether the current PhD students will be the future generations of accounting academics, or if they are a dying breed.

In this general rethinking of the role of Accounting, someone tried to question about the new functions of Accounting Education.

In fact, Accounting education currently runs the risk of not understanding the reality of accounting practice and potentially giving up great opportunities regarding data and analytics take over, by letting other organizational functions, such as IT and marketing (Payne, 2014).

Therefore with a comeback to the origins of teaching, with a discussion about the new ways to train the teaching staff, the Education returned to the center of the scene.

According to Gragg (1940), teaching is a social art that necessarily involves relationships among people. The success of teaching depends upon a quality or attitude of mind that enables the teacher to make the relationship between teacher and student a reciprocal one. Thus neither all the teaching should be done by the teacher, nor all the learning should be done by the student.

Over the past several years, there has been a resurgence of interest in teaching not only in Accounting field and in the University context, but even in adult education and in general in the higher education.

According to Pratt, Collins and Jarvis-Selinger (2001), in adult education, this can be seen in the increased presence of papers on teaching within the proceedings of adult and higher education associations in North America, Europe and Australia. Within higher education this resurgence is evident in the emergence of centres for faculty development and teaching at colleges and universities around the world. Once again, teaching has reclaimed a place of honor in adult and higher education.

At the same time, there is a call for teachers to be critically reflective in their practice of teaching, because professions have pushed for their members to reflect critically on the underlying assumptions and values that give direction and justification to their work. For many teachers this is not an easy task (Pratt, Collins and Jarvis-Selinger, 2001).

What does it mean to teach? What are the values underlying the teaching? How do teachers approach students? What is the impact of society on the subject taught? There is a series of questions that each teacher begins to ask himself to understand if his style of teaching is in line with the times. Teachers want to reflect on who they are and how they teach but with an implied message that that reflection should conform to some preconceived notion of a “good” teacher (Collins and Pratt, 2010).

In this vein, based on a constructivist view of knowledge and learning, the works by Pratt and Collins (1992) and by Pratt (1998) developed a contemporary and easily self-administered teachers evaluation instrument called the Teaching Perspectives Inventory (TPI), a tool broad applicability to a range of education contexts.

The TPI differentiates between five perspectives on teaching: Transmission, Developmental, Apprenticeship, Nurturing, and Social Reform. Each perspective incorporates fundamental beliefs about teaching and learning, instructional intentions within teaching contexts, and concrete actions.

The development and use of the TPI has undergone rigorous testing with a wide range of practitioners, educators, and student teachers.

The aim of this work is to insert the TPI in the field of Accounting Education, trying to understand if the perspectives are applicable to the accounting discipline or if they have to be specially adapted to the peculiarities of Accounting.

After the highlight of the TPI framework, the paper uses a narrative inquiry research method in order to bring the TPI in the Accounting field. This work is in fact a first attempt to place the TPI in the Accounting Education sector, so it is intended to be an exploratory paper, which critically analyzes the case.

In fact, the TPI analysis is the first step towards a teaching training path that allows the teacher to grow, so that he is able to analyze his experience and reflect for design and improve teaching; to acquire awareness of the centrality of the student; to act for an open and inclusive university, to collaborate with peers and build a teaching community.

In other words, TPI is only the beginning of a new paradigm in which teachers can improve their own ability to teach with suitable teaching methodologies and the use of e-learning, but they can also use effective teaching communication, to evaluate appropriately the learning of the students and identify professional development strategies and continuing education.

The originality of this paper lies in the first attempt to talk about the teaching perspectives in the field of Accounting Education. The goal is to concentrate the efforts to set up the teaching of Accounting on the conceptions of teachers, who very often fail to follow the innovations of teaching, as they do not first make a careful analysis of their teaching profile, reflecting beliefs, intentions and actions. Therefore, the TPI can be the starting point to train teachers and allow them to develop a new didactic interaction with the classroom.

2. THEORETICAL BACKGROUND AND METHODOLOGY OF RESEARCH

The topic of this paper is Accounting Education, because the aim is to reconsider about the ways in which Accounting is taught and learned in the Universities.

In order to reach this goal the methodology of this study is a conceptual development based on a narrative research that derives from an autobiographical experience about the use of TPI.

When the author became researcher, his University proposed him a teaching training program based, in the preliminary part, on the analysis of teaching perspectives. Based upon that experience, this research started with an analysis of previous literature in Accounting Field. With a bit of surprise, no previous works about TPI were found in Accounting Journals, so it emerged a lack in the literature that could be remedied with this first exploratory paper.

To link the TPI with the Accounting and to express the opinion about the perspectives proposed by Pratt, Collins and Jarvis-Selinger, this paper follows the narrative approach, drawing a story about the experience of the author with TPI.

For this reason, the conceptual framework of the paper is the narrative inquiry.

According to Stride et al. 2017, there is much debate about what narrative inquiry is. Clandinin (2013) describes it as an overarching term that encompasses the activities involved in generating, analyzing and re-presenting stories of life experiences. Narrative inquiry then can be considered as a methodology that includes the collection of data, analysis and dissemination. Connelly and Clandinin (2006) distinguish four types of narrative inquiry: 'living', 'telling', 'retelling' and 'reliving'. In relation to living and telling, researchers ask people to share their experiences of life using a range of methods including ethnography, autoethnography, interviews, journals, diaries, memoirs, photographs, artefacts, blogs and field notes.

Connelly and Clandinin (2006) believe narrative inquiry consists of three commonplaces. First, the temporality of an event or person is considered in relation to the past, present and future. The event or person should not be seen in isolation but should be rather considered within a temporal boundary. In this case the stories of teaching perspectives (reflecting the beliefs, the intention and the action of Accounting teacher) might consider interactions with other teachers during and after the training program, and with the previous teaching experiences of the field with the students. For this temporal dimension, the story becomes layered in a way that moves beyond merely description to become more exploratory.

The second commonplace is sociability and is related to personal and social conditions. Personal conditions include the feelings, hopes, desires and reactions of the individual. In this case, how did the teacher approach the training program and how did he change his mentality during the training? Obviously, social conditions refer to the context the individual occupies such as the environment they are situated within and other people contributing to the structuring of that setting. For teachers this might include understanding their role, the extent to which they had contact with the students, and the nature of this contact.

The third commonplace is place and relates to where the event occurs. That is, the physical boundaries of place, which may change in relation to the temporal account. In this case, place may be the classroom where the training course takes place, the classroom where the teacher gives lessons and his studio where he plans the methods for carrying out the lessons.

These three common places offer checkpoints for the narrative inquirer. Connelly and Clandinin (2006) note that whilst other qualitative inquiry may address one or more of these commonplaces, a narrative inquiry is the simultaneous exploration of all three. In this way, narrative inquiry can be

considered as an overarching methodology that includes each stage of the research process (Stride et al., 2017).

In this paper we were guided by the thinking of Connelly and Clandinin (2006) particularly in relation to presenting the story. So we do not claim that our methodology is the narrative inquiry per se, but we are inspired and guided by this approach.

In other words, the paper used the three commonplaces – temporality, sociability and place – to draw the area in which is described the link between TPI approach and Accounting teaching and learning.

Using a qualitative research, the work started with a critical literature review in order to reply some questions like: Who is writing about the subject? What standards do they establish? What are the most compelling arguments they make?

After this part, the paper continues with the story of TPI, split in two parts. The first one is about the opinion of the proponent authors about TPI, the second one refers to the original story of this paper, about how to link TPI and Accounting field.

The core of the work is the part about the Discussion, in which the story becomes a tool in order to rethink the ways of Accounting teaching and learning.

3. LITERATURE REVIEW

Over the years, researches about Accounting Education focused on different issues concerning teaching and learning of Accounting in universities.

Works of international scholars have involved mainly the following areas (Paisey and Paisey, 2004): undergraduate and postgraduate courses, teaching programs, teaching methods, characteristics of students and teachers, student selection and subsequent employment at the end of the university course, relationships between teaching and professional issues. Therefore Accounting Education is a field of research very flourishing, and many scientific journals are born on this field (*Accounting Education, Advances in Accounting Education, Issues in Accounting Education, Journal of Accounting Education*, etc). Research topics are varied over time and over the years have also intensified periodic surveys of the literature (Rebele et al., 1991; Rebele et al., 1998; Apostolou, Watson, 2001; Watson, 2003 and 2007; Apostolou et al., 2010).

Many authors have questioned over the years on new teaching methods, proposing different reading keys. Thomson and Bebbington (2004) asked an interesting question: It does not matter what you teach?, while Boyce (2004) suggested that accounting education reform needs to go well beyond the putative reform agenda of the organised professional accounting bodies. Always Boyce, with Williams, Kelly and Yee (2001) questioned about the traditional teaching methods concluding that

they lead to learning behaviours that are inconsistent with the development of generic skills (Inman et al., 1989; Gow et al., 1994). This suggests that student approaches to learning can be modified by specific learning situations and teaching strategies (Schmeck, 1983; Beattie et al., 1997). Accounting educators must focus on generating appropriate attitudes, including tolerance for uncertainty and ambiguity; willingness to deal with complexity and confusion, acceptance of conflicting information, courage to take risks, and a fundamental desire to enhance thinking and problem-solving skills (Rubenstein, 1975; Crow, 1980). It must be recognized that the real problem for accounting education is not student attitudes and strategies per se. It is the extent to which preferences and associated strategies are challenged and modified by teaching and assessment strategies which students encounter (Boyce et al 2001).

These aspects exceed the boundaries of the accounting and match all the field of Education. In fact, nowadays we are asked more and more how to model the teaching on the new needs of students and concrete reality. Teachers are therefore doubtful and continually question themselves on their way of teaching. Paths have emerged in all areas of knowledge aimed at teaching teachers how to teach.

Several authors wrote about the new challenges of teaching, focusing on different aspects: the innovation of learning teaching methodologies by an active learning (Kuhn and Dean, 2004; Coryell, 2017), the learning skills also in relation to life and professional contexts (Le Boterf, 1994), the digital culture and the need for e-learning teaching (Ala-Mutka, 2011), the new permanent assessment, widespread and participated (Sambell, 2011; Nicol et. al, 2014).

Particular emphasis should be put on the role of Universities in the drawing of teaching and learning skills of professors, in view of the development of innovation processes of teaching (Yerevan Conference, 2015; EUA, 2015). In particular, European Union has set itself a lot of educational goals for the following years. In particular: to give incentives to institutions and teachers to commit themselves to innovate their teaching by creating learning contexts focused on the student and using digital technologies; to promote a closer link between teaching and learning and research at all levels of study; to recognize and encourage quality teaching; at the same time offer opportunities for skills improvement teaching staff; to involve students actively in the design of the courses study and quality assurance.

Many working team have produced works about the future challenges in teaching. The team Fostering Quality Teaching in Higher Education (OECD, 2012) wrote that the centrality of teaching is in the relationship between teaching and learning, therefore it is urgent to support the quality of teaching through the commitment of states and universities. High Level Group on the Modernisation of Higher Education (EU, 2013) wrote that public authorities responsible for high-level education should support universities to improve the quality of teaching and every institution should develop a

strategy to improve the learning, giving the teaching the value of the research. The team Modernisation of Higher Education in Europe (by Eurydice, 2017) wrote that universities should support their teachers in increasing their teaching skills, appreciating the more worthy ones, so that all academic staff in 2020 should have received a certified pedagogical training.

The high professionalism of the teacher is a primary and indispensable factor for good learning and effective teaching. The most prestigious universities in the world (Harvard, Berkeley, Cambridge, Oxford) have developed specific structures, generally called Teaching Learning Centers (TLCs), with the aim of developing research in the field of teaching and to raise the quality of teaching, enhancing the professional communities and increasing the teaching skills of individuals and groups.

Investment in university teacher training has long been a key strategic choice in almost all countries (Spain, France, Holland, Sweden, Finland, etc). In Sweden, Norway, the Netherlands, Great Britain, Latvia it is mandatory to have an initial IET certification (Initial Entry Training) to preserve university teaching assignments.

The training of newly hired teachers is a widespread practice (Austin et al. 2007; Gappa et al., 2007). These training programs aim to promote in the professors the skills of designing, choosing and conducting methodologies and technologies to encourage and evaluate learning, to manage partnerships with students.

In this scenario, other Authors have proposed a lot of means in order to form teachers. Huston and Weaver (2008) wrote about the Peer Coaching (reciprocal or one-way with consultation of the request, observation, debriefing and feedback), Boyer (1990) proposed the SoTL, i.e. Scholarship of Teaching and Learning, in three steps: reflection, investigation-research, sharing with the wider community. Cox (2004, 2013) launched the FLCO, i.e. Faculty Learning Communities, building a community (6-15 members) in which propose an annual, active and collaborative program focused on improving teaching and learning, with seminars and activities of reflection and research.

All these training paths require a preliminary phase, during which the teacher must reflect on his starting state of the art, before proceeding with the training. It is at this stage that the Teaching Perspectives Inventory (TPI) takes shape.

Teaching perspectives are important in any exploration of pedagogical practices that cooperating teachers employ in their interactions with student teachers (Clarke and Jarvis-Selinger, 2005). Therefore many researchers have attempted to conceptually define and empirically document perspectives on teaching (Chan, 1994; Feiman-Nemser, 1990; Stofflett and Stoddart, 1994). Their efforts have resulted in considerable agreement between and among the various attributes. But the most consistent model about the perspectives is TPI by Pratt, Collins and Jarvis-Selinger.

4. THE TEACHING PERSPECTIVES INVENTORY

People unfamiliar with the concept of “perspectives” sometimes confuse them with “teaching styles” or even “teaching methods”, but perspectives are more fundamental and penetrating. According to the TPI by Pratt, Collins and Jarvis-Selinger, the perspectives are five: Transmission, Developmental, Apprenticeship, Nurturing, and Social Reform. They describe them as follows.

A) Transmission

Effective teaching requires a substantial commitment to the content or subject matter. Good teachers have mastery of the subject matter or content. It is a teacher’s primary responsibility to represent the content accurately and efficiently for learners. It is the learner’s responsibility to learn that content in its authorized or legitimate forms. Good teachers take learners systematically through sets of tasks that lead to content mastery. Such teachers provide clear objectives, adjust the pace of lecturing, make efficient use of class time, clarify misunderstandings, answer questions, provide timely feedback, correct errors, provide reviews, summarize what has been presented, direct students to appropriate resources, set high standards for achievement and develop objective means of assessing learning. Good teachers are enthusiastic about their content and convey that enthusiasm to their students, and for many learners, they are memorable presenters of their content (Pratt et al., 2001).

B) Apprenticeship

Effective teaching is a process of enculturating students into a set of social norms and ways of working. Good teachers are highly skilled at what they teach. Whether in classrooms or at work sites, they are recognized for their expertise. Teachers must reveal the inner workings of skilled performance and must now translate it into accessible language and an ordered set of tasks. Learning tasks usually proceed from simple to complex, allowing for different points of observation and entry depending upon the learner’s capability. Good teachers know what their learners can do on their own and what they can do with guidance and direction; namely, engaging learners’ within their ‘zone of development’. As learners mature and become more competent, the teacher’s role changes, and over time, teachers offer less direction and give more responsibility as they progress from dependent learners to independent workers (Pratt et. al, 2001).

C) Developmental

Effective teaching must be planned and conducted “from the learner’s point of view”. Good teachers must understand how their learners think and reason about the content. The primary goal is to help learners develop increasingly complex and sophisticated cognitive structures for comprehending the content. The key to changing those structures lies in a combination of two skills: (a) effective questioning that challenges learners to move from relatively simple to more complex forms of thinking, and (b) ‘bridging knowledge’ which provides examples that are meaningful to the

learner. Questions, problems, cases, and examples form the bridges that teachers use to guide learners from simpler ways of thinking and reasoning to new, more complex and sophisticated forms of reasoning and problem solving. Good teachers work hard to adapt their knowledge to each learner's level of understanding and ways of thinking (Pratt et al., 2001).

D) Nurturing

Effective teaching assumes that long-term, hard, persistent effort to achieve outcomes from the heart, as well as the head. People are motivated and productive learners when they are working on issues or problems without fear of failure. Learners are nurtured by knowing that (a) they can succeed at learning if they give it a good try; (b) their achievement is a product of their own effort and ability, rather than the benevolence of a teacher; and (c) their efforts to learn will be supported by their teacher and their peers. The more pressure to achieve and the more difficult the material, the more important it is the need for support in learning. Good teachers promote a climate of caring and trust, helping people set challenging but achievable goals, and providing encouragement and support, along with clear expectations and reasonable goals for all learners. They do not sacrifice self-efficacy or self-esteem for achievement. Therefore, the assessment of learning considers individual growth or progress as well as absolute achievement (Pratt et al., 2001).

E) Social Reform

Effective teaching seeks to change society in substantive ways. From this point of view, the object of teaching is the collective rather than the individual. Good teachers awaken students to the values and ideologies that are embedded in texts and common practices within their discipline. Good teachers challenge the status quo and encourage students to consider how learners are positioned and constructed in particular discourses and practices.

To do so, common practices are analyzed and deconstructed for the ways in which they reproduce and maintain conditions deemed unacceptable. Class discussion is focused less on how knowledge has been created, and more by whom and for what purposes. Texts are interrogated for what is said and what is not said; what is included and what is excluded; who is represented and who is omitted from the dominant discourses within a field of study or practice. Students are encouraged to take a critical stance to give them power to take social action in order to improve their own lives; critical deconstruction, though central to this view, is not an end in itself (Pratt et al., 2001).

The TPI consists of 45 items clustered into three groups of 15 items each (15 beliefs, 15 intentions and 15 actions). For each of the five perspectives, 3 of its 15 items describe instructors' beliefs about learning, teaching and knowledge; 3 their intentions; and 3 their educational actions. The items relevant to the actions and the intentions of the instructors are rated along a five-point scale ranging from 'Never' to 'Always'. Items relevant to beliefs are rated on a 5-point Likert scale ranging from

'Strongly disagree' to 'Strongly agree' (Pratt, Collins, and Selinger 2001). The score for each teaching perspective is calculated as the sum of values across beliefs, intentions and actions that correspond to that perspective. Therefore perspective scores could vary from a minimum 9 to a maximum of 45 (Collins and Pratt 2000).

According to the proponent authors, the Teaching Perspectives Inventory gives direction to the process of critical reflection by providing a baseline of information as well as articulating teachers' own beliefs about learning, knowledge, and the social role of "teacher." TPI provides a means of tracking and looking more deeply at the underlying values and assumptions that constitute teachers perspectives on teaching. The TPI also provides a well-articulated basis from which to justify and defend approaches to teaching when under review or evaluation.

Pratt et al. (2001) have demonstrated that often one or two perspectives are usually more dominant for individual teachers across a range of pedagogical contexts and, as such, the TPI provides insight into the ways in which the teachers view knowledge and the sense they make of the relation between the knower and the known.

5. THE TPI IN THE ACCOUNTING EDUCATION

5.1 A new way of thinking

The TPI can be used in aiding self-reflection, developing statements of teaching philosophy, engendering conversations about teaching, and recognizing legitimate variations on excellence in teaching. In particular, according to proponent authors, TPI could be used in order to a) anticipate an evaluation of own teaching skills and style; b) observe and evaluate other teachers' performance; c) examine personal beliefs and values about teaching; d) assist reflective practitioners about what to reflect upon; e) affirm that there is more than one right way to be a good teacher.

The general model also provides a means by which adult educators can articulate their approach to reflect meaningfully on their teaching and its possible improvement, try to reply at questions like: What do I really believe about teaching? What am I actually trying to accomplish with my learners? What do I usually do in the classroom?

Following this approach, the paper tries to insert now the TPI in the field of Accounting, detecting how the five perspectives are in line with the Accounting sector. To this end, the story about the TPI experience of the author is presented. In particular, during his training programs, the author was called to rethink the own teaching style, reflecting about beliefs, intentions and actions alongside the five perspectives.

5.2. The story about the Perspectives

A)Transmission

Mastering the topics is fundamental in accounting, as they are subject to changes over time due to regulatory innovations. If accounting standards change, the teaching of financial statement must also be revised, as Accounting is not a repeat that is unchanged over time, but needs to be continually reviewed and updated.

Consequently, the presentation to students of a precise, accurate and updated content puts teachers in the condition of new stimuli in learning and study.

Obviously it is not enough to tell the students the accounting principles, or the laws that govern the preparation of the financial statements. The exemplifications, the concrete cases of application of abstract laws are fundamental. In this way the students guide in the discussion of the topics, following an approach that moves from the general to the particular.

To translate this aspect into practice, the ideal thing would be to dedicate half of the lesson's duration to the concrete reality. At the same time it means encouraging students to study the principles of application of accounting standards or the preparation of financial statements. It is obvious that the textbook is not sufficient, indeed many times it represents the original didactic support for the study of the subject. It is essential to provide a supporting bibliography, made of primary sources (law and accounting standards, corporate documents) and secondary sources (articles and books).

Today, with the help of technology, accounting became a question of knowledge, so the accounting records must be understood in the essence and not technically repeated.

Summing up, the good presenter of Accounting thoroughly studies the discipline, immediately grasps the news and innovations to students with a practical style.

B) Apprenticeship

Teaching the Accounting, the teacher must train students so that they are able to understand the world when they will enter the workplace. Therefore the experience on pitch accumulated by the teacher is fundamental. The teacher cannot teach Accounting if he has never entered in the firm, if he does not know the industry and daily operations of a company.

Teacher must always keep the rudder pointing at the concrete reality, so that students can be directly introduced in the firm's environment. Teachers must then leave space for students' creativity, even in a seemingly repetitive subject such as Accounting. If in the first lessons it is right that the teacher is speaking almost exclusively, then students should also have a say and express their opinion, as well as try to complete the concepts introduced by the teacher.

The teacher who stimulates the apprenticeship is the one who pushes the students to confront reality, to get their hands dirty and to learn by doing.

C) Developmental

Accounting should be taught to make students understand it, not to testify that the teacher is good. So it is useless to find the most attractive way to present the slides, if their content is incomprehensible to the students, or to try to present a rich and varied program, then it is difficult to manage the natural learning of the students. The Teacher needs to put himself in the shoes of the students, understand how they reason and how they store the concepts, so as to propose the contents in a way that they are easily assimilated and applicable.

The teacher must strive to make students grow from a personal and professional point of view. Critical questions must be asked in order to question them on the usefulness of an evaluation criterion, on the meaning of a drafting principle or on why some accounting items go into the Income Statement and others in the Balance Sheet.

The study of Accounting must contribute to the resolution of concrete problems, therefore students must be able to understand the accounting problem and identify the best solution to solve it. In this way the teaching of Accounting is functional to the cognitive development of the student.

The teacher's effort must be to calibrate his own knowledge on the basis of the student's, so as to be able to work on the same level, and to support the development of the critical discernment capacity of the students.

From the developmental point of view, the good teacher stimulates students' minds, opening new horizons for them, so that, moving from the current accounting problems, they are able to foresee the future and to think increasingly convincing answers for their resolution.

d) Nurturing

Stimulating intelligence and expanding students' minds is not enough. The accounting teachings need to go straight to the hearts of the learners, feed them as daily food.

The rules of double entry must be assimilated like bread and water, so as to become nutritious for the future professional career.

However this nurture must be won by the student and not simply granted by the teacher. The student must understand that the assimilation of the content takes time and dedication, but eventually it will lead to at least three rewards: the short term is the passing of the Accounting exam, the medium term is the achievement of the degree that of long term is the fruitful inclusion in the working context.

The results to be obtained in order to pass the exam must be clear, just as the necessary preparation to obtain the sufficiency in the test must be clear. Teachers do not need to build the exam with impossible questions or complicated exercises: a scale of values must be built within the student's reach, which should be stimulated in the ascent step by step.

In the case of a written exam, the spaces for the answers to the theoretical questions must be clarified so as to prevent the student from ranting. In the practical part, the exercise must be unambiguously developable.

The good nutritionist is someone who stimulates the student to learn the accounting contents, to make them their own, to apply them according to their own style, but by inserting themselves in the right path of good practices.

e) Social Reform

Today's student must be able to change the society of tomorrow. This is why the ingredients of the Accounting course must be compatible with those of the other courses, so as to compose the winning recipe to allow the student to establish himself at work.

The Accounting teacher must strive to clarify the value aspect of the discipline, the guiding principles of the law, the values underlying the set of accounting rules.

The student must be able to become not only the user or the preparer of the annual accounts, but also the one who establishes the underlying framework.

To this end, in the lessons it is necessary to dwell on the aims, on why some accounting settings are followed, on what lies behind the accounting laws.

Teachers must not limit themselves to the mainstream, but also present the lines of thought and the prospects that are today a minority, but in the future, perhaps will be dominant. The student must have the clear picture in order to understand what are the basic values underlying the Accounting.

The social reformer is the one who looks beyond today, instilling in students the reactionary force, the desire to change, the desire to react to the status quo and to innovate it by following their values.

5.3. The story about the Areas

In each perspective three areas of reflection must be discussed: the first is linked to beliefs, the second to intentions and the third to actions.

A) Beliefs

The Accounting teacher must put himself in the perspective of strongly believing in his role as an educator of pupils who will go to work as employees or freelancers and who will have to concretely apply the contents given in the lessons.

Believing in his own role means becoming passionate about the story, getting into the details of what is being explained, proposing concrete examples. In other words, to mature the belief that his own role is functional to the students learning.

B) Intentions

Between believing and acting there is what a teacher really thinks of doing. When the teacher is in the classroom, he finds himself having to manage the contingency or the emergency, just as sometimes

getting caught up in enthusiasm or enthusiasm does not go as planned. Instead, it is important to always strive towards the goal, strive to achieve it and then analyze what has not been done about what he wanted to do.

C) Actions

Each Accounting teacher has his own style, his way of presenting the topics, his ability to approach the classroom and interact with the students. The teaching of the Accounting requires a style very marked on the examples and on the numbers, little mnemonic and more applicative. It is therefore necessary to concretize his own ideals during teaching in front of the students and the contents must be given to them.

6. DISCUSSION

After the presentation of the story about the experience with the TPI in the Accounting teacher training program, in this paragraph there will be an attempt to link TPI and Accounting field.

A good teaching of Accounting must move from the identification of learning objectives. In fact, the teacher must place the student in the center of attention.

The setting of good learning objectives can allow the teacher to dominate some strategic levers. First of all, knowing how to identify and reflect on the aims of his own teaching to define appropriate learning outcomes. Secondly to acquire awareness of the centrality of learning, of the needs of students and how to adapt accordingly educational planning. Finally to know how to improve own ability to conduct the frontal lesson and experiment with new teaching methods student centered (e.g. problem based learning, group work, self-directed learning, case studies, discussions, etc.) to be applied in the own didactic and professional action.

On one side, accounting teachers should be able to analyze and use an effective teaching communication using conscious verbal and non-verbal models and mediators (slides, videos, images, ...) functional with respect to the achievement of the expected learning objectives. On the other side Accounting teachers should be able to reflect on their own teaching experience and to compare oneself with others in a collaborative dimension by building a teaching community where they can share values, objectives, experiences and practices.

In other words, teachers have to choose and experiment a set of appropriate approaches and methodologies of teaching and learning in order to reach the expected results and to promote learning through ongoing assessment and feedback by students.

If the student is in the middle, the teacher has to outline, in a precise and timely manner, the skills that the student must be able to reach during the course of Accounting.

What should a student acquire during an Accounting course? First of all specific skills related to the subjects of study: to know the accounting principles, the rules for the functioning of the double entry, the evaluation criteria of the balance sheet items, the correct book-keeping of the accounting entries.

Then a strong problem solving ability, since the resolution of everyday problems is the most important skill of an accountant. To do this, students need to open their mind and develop a strong talent for reasoning. This is linked to a strong critical thought, an acute spirit of observation and discernment, capable of making people think before deciding and investigating the facts in depth.

Since accounting is a practical discipline, the analytical skills of mathematical and logical calculation cannot be neglected. However, since the business reality is also made up of processes and not just numbers, the Accounting student must also become a decision maker, able to evaluate himself and the choices made at work.

To do all these things, the Accounting teacher must be motivated and encouraged on the teaching side. Therefore a system of career progression and promotion based exclusively on research results can lead to a reduction in the role of teaching. It would be better if, in addition to the number of books or articles published in international high-level journals, the satisfaction level of the students could also be included in the parameters to promote or not a teacher along the academic hierarchy.

Accounting Teaching is a "journey" (Massey, 2002) in which students and teachers have to walk arm in arm, both in the perspective of growing and being useful to each other. The Student has to be an active partner, asking questions, searching for solutions in a perspective process oriented.

The Teacher has to design paths of teaching and learning by enhancing the research activity. He should achieve general skills so as to be able to teach using a repertoire of techniques and teaching methodologies; to identify, process and use resources for teaching and learning; to stimulate learning and verify them with a fair and impartial mode; to monitor the effectiveness of teaching for achievement of the expected results; to coordinate his educational activities with those of colleagues; to supervise students' theses, reports and projects; to support students through actions of orientation, tutoring and coaching.

On this journey the Accounting teacher has to coordinate the set of activities of teaching at various levels of education superior, through collegiate work, in partnership with students by interpreting procedures and regulations. He has to manage the analysis of training needs in collaboration with the firms; he has to assume leadership functions and styles of communication to coordinate commissions and working groups; he has to promote innovation at the system level services supporting the quality of the teaching and training; finally, he has to connect teaching and research activities with administrative and governance ones.

It is possible to affirm that in this scenario, the survey of perspectives becomes an internal analysis tool, which in the field of accounting can allow the teacher to reformulate himself.

In the first perspective (Transmission), Accounting teacher present the contents more appropriately, with passion, outlining clear objectives, adapting the pace of the lesson and providing support to students for the clarification of doubts.

In the second perspective (Apprenticeship), Accounting teacher accompanies the students towards increasingly complex tasks, with a strong leadership role at the beginning and progressively less and less present, for the development of autonomy in the students.

In the third perspective (Developmental), Accounting teacher stimulates the students with problems, cases, examples, to solve even new situations in which they are actively called to intervene, creating connections between knowledge.

In the fourth perspective (Nurturing), Accounting teacher creates a climate of care and has confidence in the ability of the students (with attention to the process as well as to the product), supporting them to reach challenging but reachable objectives.

In the last perspective (Social Reform), the teacher promotes a critical analysis on situations and on possible interventions of students to improve their lives and society.

To conclude, the TPI could serve to promote a personal reflection of the Accounting teacher on their perspectives and their balance, or on any differences, identifying possible internal inconsistencies (between beliefs, intentions and actions) and external among the perspectives.

7. CONCLUSIONS, LIMITATIONS AND FUTURE DEVELOPMENTS

The global digital revolution has irrevocably transformed societies and industries. Even the accounting profession is predicted to experience a significant change in the future, due to technological developments. Practices will be automated and related positions will become obsolete, thus accounting graduates need to be educated for new and different tasks and positions (Al-Htaybat et al. 2018). New technologies are expected to and are already changing accounting education, the way in which teachers have to teach the Accounting. For this reason teachers are called to reflect heavily on their way of teaching and to rethink their approach with students. A good way to start again on this path to redesign their style is to analyze their teaching perspectives. From this point of view, the TPI can be a useful tool for support. The five perspectives – Transmission, Apprenticeship, Developmental, Nurturing and Social Reform – make up with the Accounting world and therefore can be brought in this sector.

This paper was intended to be a first exploratory attempt to introduce the concept of TPI in the accounting education literature, because TPI has a useful application well beyond a simple exercise in

self-examination and values clarification among adults who hold varieties of teaching responsibilities. TPI could be a powerful tool in faculty development, teaching assessment, teaching improvement and peer reviews of teaching.

This work has tried to fit into the previous literature, trying to make a step forward to the studies. Thus connecting to Veenman (1984) and Grossman (1992), the work has tried to focus, through the story of a life experience, on the training of newly recruited teachers, who thanks to the TPI can verify their own knowledge.

Following the call of Hubbal et al. (2005) and Collins and Pratt (2011), the work the work has included the TPI in a new field of teaching, that of accounting. In particular, this work has been inserted in the field of Accounting Education, proposing a tool capable of increasing the quality of teaching and making the Accounting teacher an innovator, following what was proposed by Watty (2005) and Watty et. al. (2016).

Finally, we think that by using TPI Accounting Education could: a) draw a new direction for his future (Burnett, 2013); b) bring together the interest of the entire teaching faculty around a topic of training (Fogarty et. al., 2016); c) find a new tool able to focus the teacher on the needs of the world of work (Jackling and Delange, 2009).

The limitation of this work are mainly related to the methodology: as being linked to an experience of the author, the case could not be generalized. In order to remove this limitation, the future developments could affect the generalization of results to other fields, presenting some new experiences on the use of TPI.

INTERNATIONAL NEGOTIATIONS PROTOTYPES: THE IMPACT OF CULTURE

Ogliastri, Enrique^{1,2}; Quintanilla, Carlos²; Benetti, Sara²

¹ IE University, Madrid, Spain

² INCAE Business School, Alajuela, Costa Rica and Managua, Nicaragua

ABSTRACT

We find three negotiation prototypes in a sample of 2099 observations of negotiation strategies in 60 countries, using latent class analysis to uncover the structure of the data. One prototype is oriented to personal relationships, informal negotiation procedures, the expression of affection and a flexible agenda for a polychronic procedure. A second prototype is formal, facts-focused, monochronic and risk averse, adhering to a business rationality of maximizing economic value but disregarding personal relationships. The third prototype emerging from the data is in between the other two and is characterized by a large proportion of inconclusive values. Culture is a predictor of negotiation prototypes. A negotiator from the overlapping clusters of dignity cultures (Anglo areas and Protestant Europe) is highly likely to practice formal negotiation. The face (Confucian Asia) cultural cluster is more evenly divided between the formal negotiator prototype and the other two. A negotiator from the honor (Latin America and the Middle East) cultural cluster is more likely to practice personal negotiation. About half of negotiators from the Latin Europe (mostly honor) cluster fall into the intermediate prototype, with the remainder equally divided between the formal and personal prototypes. Future research on the effectiveness of each prototype is needed.

Purpose: This paper aims to better explore the relationship between culture and negotiation, identifying clusters of negotiation strategies and assessing whether the negotiator's culture has a significant impact in determining the probability of adopting one strategy over the others.

Methodology: Taking a grounded theory approach, we implement latent class analysis on a sample of 2099 observations of negotiation strategies in 60 countries, to identify cluster behavior in the presence of manifest, categorical variables. We extend the standard LCA model to include culture as a covariate.

Findings: We identify three negotiation prototypes. One prototype is oriented to personal relationships, informal negotiation procedures, the expression of emotions and a flexible agenda for a polychronic procedure. A second prototype is formal, facts-focused,

monochronic and risk averse, adhering to a business rationality of maximizing economic value but disregarding personal relationships. The third prototype emerging from the data is in between the other two and is characterized by a large proportion of inconclusive values. Culture, defined both on geographic grouping and on the dignity/face/honor framework, is a significant predictor of negotiation prototypes.

Originality and value: The paper presents an untraditional, analytical approach based on data clustering on a large and truly multi-country sample. This “from-data-to-theory” procedure allows to highlight the significant role of culture in determining negotiation strategies.

Practical implications: The paper draws attention to the importance for international managers of handling positive emotions, establishing long-term relationships, and dealing with trade-offs during negotiations. Negotiators from different cultures can learn from one another, maximizing the opportunities to take advantage of a “culturally synergetic” approach.

Keywords: Negotiation culture, country culture, honor culture, integrative negotiations, distributive negotiations, negotiation strategies, negotiation clusters, latent class analysis.

“This is indeed a mystery,” I [Watson] remarked. “What do you imagine that it means?”

[Sherlock Holmes:] “I have no data yet. It is a capital mistake to theorize before one has data. Insensibly one begins to twist facts to suit theories, instead of theories to suit facts.”

– Sir Arthur Conan Doyle²²

INTRODUCTION

Do people negotiate differently based on their cultural background? The value of negotiation strategies across cultures has been a focus of research for decades, in the attempt to understand whether culture affects and can help to predict negotiating behavior. Negotiation prototype theories have been dominated by the distributive/integrative framework developed in the US (Fisher and Ury, 1981; Walton and McKersie, 1965), but its theoretical and practical validity in international contexts is still a pending issue.

The literature on culture is rich and multidisciplinary, and different frameworks are proposed (e.g., House et al, 2004; Inglehart et al., 2014; Leung and Cohen, 2011; Ronen and Shenkar, 1985; Schwartz,

²² Citation from: “The Adventures of Sherlock Holmes” by Sir Arthur Conan Doyle (Wordsworth Editions Limited, Ware, UK, 1992, p. 119).

1999), even if they overlap to some extent in their cultural clustering of countries. The relationship between country culture and negotiation strategy has been studied for a while. Even if it is rather accepted that the cultural background of the negotiators has an effect on their interests, priorities and strategies during the negotiation process (e.g. Brett, 2017), this literature still lacks congruence and a solid, homogeneous and holistic framework (Adler and Aycan, 2018; Brett and Thompson, 2016).

We aim to contribute to this stream of research through an empirical analysis based on grounded theory (Glaser and Strauss, 1967, *Chapter VIII: Theoretical Elaboration of Quantitative Data*). We take an inductive approach (“from data to theory”) with the objective of identifying clusters of negotiation strategies and assessing whether culture has a significant effect in determining which negotiation procedure is more likely to be adopted by a certain negotiator. To do so, we implement a latent class analysis (Collins and Lanza, 2010), which is a statistical model to identify cluster behavior using categorical variables.

We use a dataset of 2099 observations of negotiation behaviors and practices in 60 countries, which allows us to identify the variables most relevant to discriminating among negotiation clusters (Fop, Smart and Murphy, 2017) and to describe the typical behavior of each cluster. Moreover, by including culture as a covariate in the model, we can assess its impact on the likelihood of membership in each negotiation cluster.

We find three negotiation prototypes: two poles differentiated by their employment of formal or personalized actions, and an intermediate, transitional cluster between the two. Culture is a statistically significant predictor of membership in these clusters, with Anglo-Germanic-Nordic individuals (from dignity cultures) showing a predominantly formal negotiation style; Latin American and Middle Eastern negotiators (from honor cultures) displaying a stronger orientation towards relationship building and handling of emotions; and individuals from Confucian (face) and Latin European (mostly honor) cultures being distributed more evenly across the negotiation clusters.

The paper is organized as follows: in the second section we review some relevant literature about negotiation prototypes, cultural clusters and cross-cultural negotiation; in the third section we describe our database, formulate the research hypotheses and present the main features of the statistical model we implement for the analysis; in the fourth section we show our results; and in the final section we elaborate the concluding remarks, discuss implications and propose some future research opportunities based on our findings.

LITERATURE REVIEW

“Culture” is a complex concept widely employed in a variety of research fields (Triandis, 1994) and can be defined in several ways according to the discipline in which it is mentioned and the peculiar

perspective that is adopted (Kroeber and Kluckhohn, 1952). Hofstede (1980, p. 21) defines culture as “the collective programming of the mind which distinguishes the members of one human group from another”, and which therefore affects how people behave, communicate and interpret reality according to well-defined mental schemes and social systems (Lytle et al., 1995). Hence, culture “is the unique constellation of dimensions characteristic of a group and revealed by particular manifestations that define the social identity of its members” (Lytle et al., 1995, p. 174). Culture affects the way people find a solution to problems of social interaction, which include negotiation; as a consequence, different cultural backgrounds can provide different tools and strategies for dealing with such situations (Brett, 2017).

There is an extensive literature on cultural characterization and classification. Among the schemes most often employed are the five dimensions proposed by Hofstede (1980, 1991) — power distance, uncertainty avoidance, individualism/collectivism, masculinity/femininity and long/short term orientations; Hall’s high/low context communication and monochronicity/polychronicity (1976); and the characterizations proposed in the GLOBE study (House et al., 2004). A more recent stream of research proposes a distinction among dignity, honor and face cultures (Aslani et al., 2016; Leung and Cohen, 2011), based on self-worth theory (Ayers, 1984). According to this framework, individuals derive social value from intrinsic self-assessment in dignity cultures, from social context and social position in face cultures and from reputation in honor cultures (Yao et al., 2017). Cultural dimensions have been extensively used as variables in research on cross-cultural negotiations, in attempts to answer the main question of whether culture has a considerable impact on negotiation strategies and outcome (e.g., Adler and Graham, 1989; Brett, 2007; Graham, 1985).

Negotiation is “the deliberate interaction of two or more complex social units which are attempting to define or redefine the terms of their interdependence” (Walton and McKersie, 1965, p. 3), and parties negotiate whenever they have conflicting interests and they prefer to search for a solution by recognizing a zone of mutual agreement (Walton and McKersie, 1965; Zartman, 1977). Scholars have proposed two predominant negotiation prototypes (Fisher and Ury, 1981; Lewicki and Litterer, 1985; Lewicki et al., 1992; Neale and Bazerman, 1991; Pruitt, 1981; Ury, Brett and Goldberg, 1988; Walton and McKersie, 1965). The distributive (or positional) negotiation strategy is based on bargaining, and negotiation is perceived as a zero-sum process in which there are a loser and a winner. In contrast, the integrative (or principled) negotiation strategy focuses on exploring opportunities to increase joint gains and create mutual value for the parties, before deciding on how to distribute the increased value according to objective criteria. Some characteristics and actions contribute to the likelihood of embracing an integrative approach to negotiation, such as willingness to propose alternatives, management of complex trade-offs and manifold issues, the propensity to understand and shape the

perceptions of other parties, and thinking out-of-the-box (e.g., Bangert and Pirzada, 1992; Barry and Friedman, 1998; Bartos, 1995; Kersten, 2001; Pruitt and Lewis, 1975; Sebenius, 1992).

These negotiation prototypes were initially developed and examined in the context of North American agreements and mediations, a limitation that generated some criticism (e.g., Adler, 1983) and, as a consequence, stimulated a broad research effort to increase understanding of the negotiation process and its outcomes in cross-cultural circumstances (Adler and Graham, 1989; Brett, 2007; Graham, 1985). Even though most studies seem to ratify the general validity of the prototypes across cultures (Graham et al., 1994), numerous scholars pinpoint relevant differentiations in negotiation styles and strategies among cultural groups (e.g., Graham et al., 1994; Hofstede et al., 2012; Metcalf et al., 2006). For instance, a negotiator from an individualistic culture is expected to focus more on personal gains (e.g. Brett et al., 1998; Graham et al., 1994), while a negotiator from a collectivist culture should concentrate more on the relationship and the discrimination between in-group and out-group partners (e.g. Brett, 2000; Hofstede et al., 2012).

This distinctness implies an increased complexity for multicultural negotiations but can also become an opportunity to take advantage of cultural divergencies, enhancing the chances of reaching a mutually beneficial agreement with higher joint gains (Adair et al., 2004; Adler, 1980; Adler and Aycan, 2018; Brett, 2000; Gunia et al., 2016; Salacuse, 1999; Sebenius, 2002).

Our research project fits into this research stream focused on the relationship between culture and negotiation prototypes, as we aim to contribute to a deeper understanding of which elements of the negotiation process significantly differentiate among negotiation strategies and how particular cultural features affect the negotiation process and outcomes.

RESEARCH

We are applying a grounded theory approach on quantitative data (Glaser & Strauss, 1967, pp. 185-220). We are performing a statistical analysis on a dataset of 2099 questionnaires about international negotiation behaviors. We agree with Ebner and Parlamis (2017) that in the negotiation field it is necessary to combine research, practice, theories and teaching. Indeed, we gathered the data for nine years (2010-2018), teaching a negotiation course in MBA programs. Each student had to deliver a term paper about negotiation behavior in his/her country of origin, based on a semi-structured interview with a foreigner to that country. The interview was about the foreigner's negotiation episodes there and the specific behaviors he/she had experienced from negotiation counterparts (the questionnaire is available upon request).

Four graduate students coded the qualitative information into 52 categorical variables that describe the behavior of counterparts in cross-cultural negotiations (the codebook is available upon request).

The Kappa inter-reliability coefficient was $K=0.65$, meaning that there was substantial agreement in the classification and conversion of the qualitative information into quantitative data.

The database covers 60 countries, which were classified into cultural clusters taking into consideration the GLOBE study (Gupta et al., 2002; House et al., 2004), the Inglehart–Welzel cultural maps based on the World Values Survey (Beugelsdijk and Welzel, 2018; Inglehart et al., 2014) and other relevant classifications in the literature (Mensah and Chen, 2012; Ronen and Shenkar, 1985; Schwartz, 1994, 1999). The cultural clusters overlap with the dignity/honor/face cultures framework (Leung and Cohen, 2011), and we combined Anglo, Germanic and Nordic Europe into a single cluster corresponding to the dignity group (Yao et al., 2017).

We applied a latent class analysis (Collins and Lanza, 2010) to identify negotiation prototypes from the data and to ascertain the impact of culture on these negotiation clusters.

This paper has three main research objectives. First, we aim to establish the existence of well-defined clusters of negotiators and describe their characteristics. We then compare and contrast the clusters identified through the statistical analysis with those suggested by the literature on negotiation. Finally, we assess whether culture affects the likelihood of belonging to the identified clusters.

Given that we are adopting an inductive research approach, we formulate our initial hypotheses in very general terms, based on strongly agreed facts in the literature, such as that there are different negotiation strategies and that culture plays a relevant role in determining which of these strategies is more likely to be implemented based on the origin of the negotiator. The aim of the analysis, beyond finding further support for these quite established hypotheses, is to “let the data speak for itself” (Benzécri, 1973), evaluating which particular patterns emerge from the data, which specific elements result important to differentiate among the various negotiation approaches, and how culture affects the probability of belonging to a certain negotiation cluster rather than the others.

Hypothesis 1: There is more than one negotiation prototype, and these negotiation prototypes display distinctive patterns related to the negotiation strategy and process.

Hypothesis 2: Culture affects negotiation behavior and significantly predicts membership in negotiation clusters.

Model

The standard model used to identify cluster behavior in the presence of manifest, categorical variables is latent class analysis (McCutcheon, 1987). We are interested in an extension of LCA — “LCA with covariates” or “concomitant-variable LCA” (Dayton and Macready, 1988, 2002; Collins and Lanza, 2010, chapter 6 and references therein) — that allows modeling the probabilities of belonging to the different clusters as a function of other covariates, e.g., culture.

We assume there exists a latent, non-observable categorical variable that can take on $c = 1, \dots, C$ possible values, denoting the class or cluster to which each observation belongs. Identifying and characterizing the behavior of these clusters is the main objective of LCA.

Conditionally on class membership, the observed or manifest variables (responses to the 52 categorical questions of our questionnaire) $j = 1, \dots, J$ are distributed according to a multinomial distribution. Each question j has $r_j = 1, \dots, R_j$ possible answers (for most questions in our survey $r_j = 3 = \{\text{Yes, No, Do not know/not sure}\}$). The standard assumption of conditional local independence of the manifest variables allows writing the joint group density as the product of the densities of each variable (Collins and Lanza, 2010). The probability of observing a particular pattern of response to our questionnaire $\mathbf{Y} = y$ in the classical version of LCA is given by

$$P(\mathbf{Y} = y) = \sum_{c=1}^C \gamma_c \prod_{j=1}^J \prod_{r_j=1}^{R_j} \rho_{j,r_j|c}^{I(y_j=r_j)}.$$

The $\rho_{j,r_j|c}$ values represent a vector of probabilities that measures the probability of a particular pattern of answers to the different questions offered by the members of a group (*item-response probabilities*). $I(y_j = r_j)$ is an indicator function that is equal to 1 when the response to variable j is r_j and is equal to 0 in all other cases. The γ_c values represent the probabilities of membership in the different classes (*latent class prevalences*). The gammas satisfy the following condition:

$$\sum_{c=1}^C \gamma_c = 1.$$

The new version of LCA we use in this paper makes the gammas—the probabilities of assigning an observation to one of the latent classes (also known as prevalences)—a function of X , a set of covariates.

$$P(\mathbf{Y} = y | X = x) = \sum_{c=1}^C \gamma_c(x) \prod_{j=1}^J \prod_{r_j=1}^{R_j} \rho_{j,r_j|c}^{I(y_j=r_j)}$$

In our case, the covariate is a set of dummy variables identifying the culture where the negotiation took place. This is the *only* channel through which the covariate affects the estimation of the model; the item-response probabilities (the rhos in the above equation) do not depend on the covariate. As a matter of fact, we can think of LCA with covariates as a two-step algorithm: in the first step, the clusters are identified without using information about the reported culture, while in the second step, membership in the different clusters is predicted with the variable culture, using a multinomial logit model. Testing for the statistical importance of culture is equivalent to a joint hypothesis about the significance of the coefficients of the culture dummy variables in this second step.

Variable selection

The questionnaire consists of 52 categorical variables, and we have 2099 observations. It is worth performing a variable selection, since only a handful of variables are likely to contain useful, non-redundant information about the cluster structure present in the data. Following Fop, Smart and Murphy (2017), we call this group of variables the set of *relevant variables*. The other variables in the dataset are referred as the *redundant variables*, since they contain information about cluster structure that has already been accounted for by the relevant variables. Dropping the redundant ones results in obvious benefits according to Fop and colleagues (2017): it reduces unnecessary model complexity, avoids potential problems of identifiability and limits poor classification performance. We can add that reducing the number of variables also economizes on degrees of freedom and simplifies the interpretation of the clusters.

Fop, Smart and Murphy (2017) extend Dean and Raftery's stepwise method (2010) by adding a *backward search* algorithm, which starts with all variables available to the researcher and discards the variables that are deemed redundant given the presence of other variables, until convergence is achieved. The algorithm also includes a *swap* step that permits reconsidering variables that have been dropped from the set of relevant variables, increasing the robustness of the variable selection process. In our case this procedure reduces the number of variables used to identify the clusters from 52 to 19 (a 62% reduction).

The variables that appear in the final set of *relevant variables* are reported in the results section in Table 3, along with the negotiator clusters. The relevant variables represent a diverse set of characteristics and behaviors that can be summarized under several aspects of negotiation: formality (1, 5, 6, 7, 18), commitment (2, 8), uncertainty avoidance (3, 4, 17), negotiation process (9,10, 15, 16), negotiation tactics (11, 13, 14) and emotion handling (12, 19).

RESULTS

With the reduced set of variables, we can proceed to identify the latent class structure. Table 1 reports the Bayesian Information Criterion (BIC) statistic for different combinations of number of clusters and presence or absence of the "culture" variable as a predictor of class membership. The BIC is generally smaller for the models with culture as covariate. The largest reductions in the BIC statistics are observed when we move from 1 cluster to 2 and 3 clusters. After that, the BIC seems to level off.

	Without Covariate Culture	With Covariate Culture
1-Cluster	78981	
2-Clusters	75834	75456
3-Clusters	73248	72789
4-Clusters	72880	72351
5-Clusters	72811	72136
6-Clusters	72822	72133

Table 1. *Bayesian Information Criterion (BIC)*

We report the existence of three clearly distinct groups of observations and determine how culture alters the probability of membership in them. There are two poles or extremes of behavior and an intermediate cluster, which is more difficult to characterize. Results for the analysis with 4 and 5 clusters are available upon request, but the main lessons from this paper are preserved (the intermediate cluster splits up and the poles become “purer”, but the main message of the analysis remains unchanged).

We find support for Hypothesis 1. In line with previous works (e.g. Ogliastri and Quintanilla, 2016), the clusters that emerge from the data and the negotiation elements that prove to be relevant for differentiation are related to handling of emotions, formality in negotiations, and management of trade-offs.

We label these three clusters as personal/emotional (Cluster 1), intermediate (Cluster 2) and formal/objective (Cluster 3). We agree with Usunier (2019) that the opposite of emotional is not “rational”; these are simply two different rationalities. About half of the sample (52.73%) belongs to the personal/emotional cluster, 19.93% to the intermediate and 27.34% to the formal/objective cluster (see Table 2).

	Cluster 1	Cluster 2	Cluster 3
	Personal/Emotional	Intermediate	Formal/Objective
Prevalences	0.5273	0.1993	0.2734

Table 2. *Latent Class Prevalences*

The intermediate cluster appears as a *transitional* cluster, in the sense that its members are caught between the two poles.

Table 3 reports how individuals in the three clusters are likely to respond to each of the 19 selected questions. For each section of the table, the columns add up to 1. Conditional probabilities greater than 0.5 are highlighted to facilitate interpretation.

Variable	Possible answers	Cluster 1 Personal, emotional	Cluster 2 Intermediate	Cluster 3 Formal, objective
1 During the negotiation, do they separate business and social activities?	Yes (they separate business/pleasure)	0.1240	0.1334	0.6323
	No (they mix business and pleasure)	0.7851	0.4616	0.2718
	Do not know/Not sure	0.0908	0.4050	0.0959
2 What is the time perspective during the negotiation?	Short term (one deal only)	0.6940	0.2697	0.3034
	Long term (they mention future deals)	0.2118	0.3283	0.5789
	Do not know/Not sure	0.0942	0.4020	0.1177
3 Is this a trusting culture? Do they normally trust other people?	Yes (trustful)	0.2684	0.2607	0.3971
	No (they expect the worst from others)	0.6927	0.4580	0.5536
	Do not know/Not sure	0.0389	0.2814	0.0492
4 Do they take nonperformance risks in negotiations?	Yes (they are risky negotiators)	0.5676	0.3559	0.2370
	No (uncertainty avoidance)	0.3828	0.3424	0.7268
	Do not know/Not sure	0.0497	0.3018	0.0363
5 Who is the main negotiator?	The boss	0.6519	0.4568	0.2743
	The group (is influential)	0.1936	0.1588	0.4867
	Other	0.1175	0.1520	0.2079
	Do not know/Not sure	0.0370	0.2325	0.0310
6 Is formality normal/usual?	Yes (rules, dress, treatment, agenda)	0.2541	0.3270	0.7665
	No (informality is the norm)	0.7167	0.4206	0.2281
	Do not know/Not sure	0.0292	0.2524	0.0054
7 Do they usually do out-of-the-office negotiations?	Yes (bars, restaurants, outings)	0.8205	0.5920	0.5964
	No (not usual)	0.1671	0.1562	0.3966
	Do not know/Not sure	0.0124	0.2518	0.0069
8 Do they come prepared to the negotiation table?	Yes (present details, data, figures)	0.2779	0.3738	0.8572
	No (they improvise)	0.5757	0.1388	0.0590
	Do not know/Not sure	0.1464	0.4874	0.0838
9 Why do they do prenegotiations?	Information exchange	0.4076	0.1730	0.3529
	Interests exploration	0.1531	0.1543	0.2283
	Both	0.2055	0.1137	0.2719
	Do not know/Not sure	0.2339	0.5591	0.1469
10 Do they make a proposal after information exchange?	Yes (explore mutual interests first)	0.4634	0.3104	0.7148
	No (immediate proposal)	0.2683	0.0994	0.1002
	Do not know/Not sure	0.2683	0.5902	0.1850
11 Do they try to be persuasive?	Yes (idea selling, rhetoric)	0.9193	0.5815	0.7062
	No	0.0274	0.0864	0.2343
	Do not know/Not sure	0.0533	0.3321	0.0595
12 Do they express affection during negotiations?	Yes (normal, acceptable, kindness)	0.6841	0.2342	0.3379
	No (neutral, cool, detached)	0.1254	0.0688	0.5460
	Do not know/Not sure	0.1905	0.6970	0.1161
13 Do they fake lack of interest during negotiations?	Yes (they hide real interests)	0.6071	0.1713	0.3004
	No (they explore mutual interests)	0.2059	0.1856	0.5584
	Do not know/Not sure	0.1870	0.6431	0.1412
14 Do they use negotiation power tactics?	Yes (they normally use threats, pragmatic)	0.4716	0.2225	0.2858
	No (they avoid confrontation, no threats)	0.3853	0.1457	0.4750
	Do not know/Not sure	0.1431	0.6318	0.2392
15 Do they discuss details and concrete facts?	Yes	0.2220	0.3702	0.8284
	No	0.6907	0.3165	0.1311
	Do not know/Not sure	0.0874	0.3133	0.0405
16 How do they handle the agenda during the	Monochronic (one single issue at a time)	0.1979	0.1725	0.5660
	Polychronic (they trade off concessions)	0.7374	0.3566	0.3394

	negotiation?	Do not know/Not sure	0.0648	0.4709	0.0947
17	Is the agenda defined before the negotiation or at the beginning?	Yes (they are agenda focused, time limits)	0.1083	0.1198	0.6881
		No (the agenda is flexible)	0.7944	0.3196	0.1920
		Do not know/Not sure	0.0973	0.5606	0.1199
18	Are lawyers, a notary and legal documents important?	Yes (indispensable)	0.5923	0.3789	0.7823
		Not really (a formality)	0.3220	0.1246	0.1490
		Do not know/Not sure	0.0857	0.4966	0.0686
19	How is conflict perceived in this culture?	Positive (constructive opportunity, direct)	0.1499	0.1826	0.3027
		Negative (dangerous, they try to avoid it)	0.7029	0.3031	0.5146
		Do not know/Not sure	0.1472	0.5143	0.1828

Table 3. *Clusters of negotiators*

Members of Cluster 1, labeled personal/emotional, are characterized as relationship oriented and informal in the way they conduct negotiations. These negotiators are reported to be generally informal during the negotiations (71.67%), not separate the personal sphere from business activities (78.51%) and have a “one deal”, short-term perspective on negotiations (69.4%). Most of them do not come fully prepared to the negotiation table (57.57%) and are not prone to use agendas for setting subjects and time limits (79.44%). The discussion switches back and forth from one issue to another (73.74% polychronic), facilitating trade-off of negotiation positions and interests. The boss rather than the group is the main negotiator (65.19%), and power tactics are used directly and openly (47.16%). A major defining characteristic of this cluster is the expression of emotions and feelings, something acceptable and part of being authentic and reliable, and affection is typically expressed during the negotiation process (68.41). Conflict is interpreted negatively and is to be avoided by subtle language rather than direct confrontation (70.29%).

Cluster 3 negotiators, labeled formal/objective, show a very different understanding of the negotiation process and implement contrasting negotiation strategies. Most negotiators of this prototype behave formally during negotiation (76.65%) and are accustomed to separate social and business activities (63.23%). Their temporal perspective is long term (57.89%). They come fully prepared to the negotiation table (85.72%) and focus on concrete facts during the negotiation (82.84%). They define a clear agenda (68.81%) and prefer to make agreements point by point (56.6% monochronic) instead of trading off issues. Members of the group have substantial influence during the negotiation process (48.67%). Individuals in this cluster prefer to keep feelings out of the process of negotiation (54.6%). They are more likely to perceive conflict as positive way to solve problems (30.27% of individuals, compared to 14.99% for Cluster 1) and less likely to use power tactics, such as feigning lack of interest and open threats.

Cluster 2, labeled intermediate, is caught between the other two. Observations in this cluster were very difficult to classify, and respondents very frequently chose “Do not know or not sure” (on average, this option is selected 44% of the time, compared to 10% and 8% for clusters 1 and 3, respectively).

Does culture have any impact on cluster membership? We claim that it does, and LCA with covariates allows us to test this hypothesis directly. The covariates in this case are a set of dummy variables for the 6 different cultures to which the participants belong (Table 4).

Cultural Cluster	Countries
1 Anglo-Germanic-Nordic (DIGNITY)	Australia, Canada, United States, United Kingdom, South Africa, Germany, Netherlands, Switzerland, Denmark, Sweden, Finland
2 Confucian (FACE)	China, South Korea, Taiwan, Japan, Singapore
3 Latin American (HONOR)	Argentina, Bolivia, Brazil, Chile, Colombia, Costa Rica, Ecuador, El Salvador, Guatemala, Honduras, Mexico, Nicaragua, Panama, Paraguay, Peru, Puerto Rico, Dominican Republic, Uruguay, Venezuela
4 Latin Europe (HONOR?)	Italy, Spain, France, Belgium, Portugal, Greece, Israel
5 Middle East (HONOR)	Saudi Arabia, United Arab Emirates, Kuwait, Lebanon, Iran, Egypt, Pakistan, Morocco, Turkey
6 Others	India, Philippines, Malaysia, Latvia, Russia, Ukraine, Albania, Bulgaria, Guam

Table 4. *Cultural clusters*

Table 5 reports the probabilities of belonging to the three identified clusters conditional on cultural clusters. The rows in this table add up to 1.

Cultural Cluster	n	Cluster 1 Personal, emotional	Cluster 2 Intermediate	Cluster 3 Formal, objective
Anglo-Germanic-Nordic (DIGNITY)	177	0.0050	0.0616	0.9334
Confucian (FACE)	68	0.2247	0.2769	0.4983
Latin American (HONOR)	1491	0.6386	0.1775	0.1840
Latin Europe (HONOR)	240	0.2701	0.4857	0.2442
Middle East (HONOR)	60	0.7058	0.0204	0.2738
Others	63	0.4984	0.0975	0.4041

Table 5. *How does culture affect cluster membership? $P(\text{Cluster} = c | \text{Culture} = x)$ – Geographical characterization*

We can test formally whether *culture* is a statistically significant determinant of cluster membership. The test is a likelihood ratio test (*LR*) that compares the likelihood of the estimated model with and without the covariate. The null hypothesis associated with this test is “culture does not matter to cluster membership”. The null is rejected easily, with $LR=242.12$ and the corresponding p-value $\square 0.01$, supporting Hypothesis 2.

Negotiators from the Anglo-German-Nordic (dignity) culture are concentrated in Cluster 3, the formal/objective one (93.29% of them belong to this cluster). For the Confucian culture, the formal/objective cluster is also dominant but less so, as only about half of its members (49.83%) belong to this cluster.

The Middle East and Latin America (both honor cultures) show very similar characteristics, with the dominant cluster being the personal/emotional one (70% and 63%, respectively). However, for Middle

Easterners, the probability of belonging to the intermediate cluster is almost null, while 17% of Latin American negotiators are classified as Cluster 2.

Latin Europe is distributed more evenly across the three clusters, with most negotiators in the intermediate cluster (48.57%), even though there is substantial presence in the other two, clearly defined clusters (27.01% in the personal/emotional one and 24.42% in the formal/objective one). Latin Europe appears as an intermediate negotiation cluster between the Anglo-German-Nordic culture on the one hand, and the Latin American and Middle Eastern cultures on the other (Fosse, Ogliastri and Rendon, 2017).

We obtain comparable results when using the dignity/face/honor framework as cultural clusters (Table 6), which confirms the correspondence between cultural characterizations generally accepted in the literature (e.g. House et al., 2004; Inglehart et al., 2014; Schwartz, 1999) and the recent cultural framework based on self-worth theory (Leung and Cohen, 2011; Yao et al., 2017).

Cultural Cluster	n	Cluster 1 Personal, emotional	Cluster 2 Intermediate	Cluster 3 Formal, objective
Dignity	209	0.0470	0.0674	0.8856
Face	119	0.3768	0.1964	0.4268
Honor	1771	0.5820	0.2209	0.1970

Table 6. *How does culture affect cluster membership? $P(\text{Cluster} = c | \text{Culture} = x)$ – Dignity/Face/Honor framework*

CONCLUSIONS

Our hypotheses are supported by the data, as we can identify three clusters or negotiation prototypes, and culture significantly determines the likelihood of membership in them.

A theoretical implication is that the dominant distributive/integrative prototypes of negotiators in the literature (Fisher and Ury, 1981; Walton and McKersie, 1965) do not fully include all the significant dimensions of negotiation behavior, such as the use of emotions and trading of issues (polychronicity). The integrated clusters we found help add new dimensions to the distributive/integrative framework; however, more research is needed to advance the understanding of negotiation strategies, outcomes and effectiveness. One possibility for further investigation in this sense is to compare, for each negotiation cluster, the probability distribution of the answers to variables in the dataset more directly linked with the integrative/distributive framework (e.g. Ogliastri and Quintanilla, 2012), i.e. examine our current results with those obtained from a deductive approach (“from theory to data”).

Besides the use of objective criteria and facts, a key trend in the practice of negotiations is the effective understanding and use of emotions (Fischer and Shapiro, 2005; Fischer, Ury and Patton, 1991). In the negotiation literature, emotions are often considered part of persuasion, on the borderline between

manipulation and distributive approaches (Yao et al., 2017). However, this topic is gathering more attention (e.g., Gelfand and Brett, 2004; Ogliastrri and Quintanilla, 2016; Posthuma, 2012; Schlegel et al., 2018): research highlights the increased value placed on subjectivity and its impact on negotiations (Sharma et al., 2013). As Fischer and Ury (1981) pointed out, a good negotiation is also measured by the establishment of a lasting relationship among the parties. Investigation on this line has been growing, but the relative benefit of dealing with emotions during negotiation is still unclear, and there are some contradictory results in the literature. For instance, Yao and colleagues (2017) include the use of emotions as a trait of distributive negotiation strategy, while other scholars report that, even though “in earlier writing, emotions were viewed largely as factors that impede performance, preventing successful coordination from occurring [...] more recently we have learned that emotions can both help and hinder progress” (Olekalns and Druckman, 2014, p. 456). Positive emotions are recognized as a means to “promote integration and innovative solutions to problems” (Carnevale and Isen, 1986, p. 3) and “foster problem solving, creative exploration of ideas, and empathy” (Shapiro, 2002, p. 70). These diverse results may relate to the fact that, since the manifestation, interpretation and acceptance of emotions are socially determined, the effects of expressive emotionality vary across cultures (Druckman and Olekalns, 2008; Olekalns and Druckman, 2014). Therefore, a paradigm of effective negotiations has to differentiate between the two sides of emotions. This is clearly related to values; a relational perspective on negotiations is as valid as a calculative one (Usunier, 2019). People-oriented cultures, such as the Latin American and Latin European ones, may more easily produce advances regarding this issue (Fosse et al., 2017). Negotiators from Latin American and especially Latin Europe seems to be quite difficult to define precisely and are less studied in the negotiation literature; more research focused on these two groups could contribute to a better understanding of their negotiation traits.

Our results further suggest that the prototype that deals with and expresses emotions during the negotiation process is also the one that handles several issues at the same time and manages trade-offs (polychronic), while formal negotiators seem to be more monochronic, even though in this case the results are more evenly distributed among the options. Trading concessions to create mutual value is probably a technique easily learned by negotiators from different cultures, and it has been a key message of updated negotiation workshops for several decades. Our interpretation is that this approach is now quite common in international negotiations, and a multitasking orientation is becoming more evident in negotiators from Anglo/German/Nordic cultures (e.g., Brett et al., 1998), indicating that, once learned, this trade-off strategy may seem useful even to negotiators who come from monochronic cultures.

These findings reinforce the opportunities represented by the “culturally synergetic” approach proposed by Adler (1980). Negotiators from different cultures can not only take advantage of their differences to increase mutual value and come up with more beneficial agreements, but also learn from each other during the negotiation process, leading to behavioral and cultural adaptations (Nadler et al., 2003; Olekalns and Smith, 2018; Thompson and DeHarpport, 1994). On one hand, Latin negotiators should incorporate the use of concrete facts and objective criteria instead of purely emotional reasons for the distribution of value; they should also learn how to be competitive enough to supersede the relational side of the process in the second stage of an integrative negotiation process (Ogliastri, 2010, 2011). On the other hand, Anglo-Germanic-Nordic (dignity) negotiators should understand how to multitask rather than deal with a single issue at a time and how to handle emotions in a positive way. In sum, the effective negotiator in a global environment is the one that is open to learn about the counterpart’s interests and priorities (Brett, 2017) and is able to adapt his/her strategy accordingly to maximize joint benefits.

Our results certainly leave room for more in-depth analysis, in particular with respect to northern/southern differences and complementarities (Van de Vliert and Conway, 2018), regional variations (e.g. Petruzzellis, Craig and Palumbo, 2017), as well as to the impact of socio-economic factors on negotiation strategies. In particular, our study examines the impact of culture defined according to both geographic elements and the dignity/face/honor framework. A pending question is whether these characterizations are together useful to explain the probability of membership to the different clusters of negotiation and whether the socio-economic level of the origin country of the negotiator has an additional, relevant impact.

From an international managerial perspective, the implications of our results confirm the relative universality of the four principles of Fisher and Ury (1981): separate people from the problem, focus on interests (not positions), invent options for mutual gain and insist on objective criteria. Our study also suggest that, for teaching purposes, these negotiation prescriptions should be enlarged to include the following two principles: first, make a personal connection to the other party, develop a positive relationship and solve the emotional issues first (Diamond, 2010); second, employ investigative negotiations (Malhotra and Bazerman, 2007), do not make decisions on single issues before knowing the relative importance of each issue for both parties and look for trade-offs to increase mutual value.

A STUDY OF EXOGENOUS GAP CRITICAL FOR CLUSTER DYNAMICS AND INTERACTION WITH GLOBAL MARKETS

Osarenkhoe, Aihie; Fjellström, Daniella

University of Gävle, Department of Business & Economic Studies, Gävle, Sweden

ABSTRACT

*This study aims to answer the following question: What platform does cluster organisation create to enable its internationalisation process in order for its partner's organisations to effectively manage the challenges brought about by the cataclysmic changes in business logic in the age of globalisation and digitalisation? **Theoretical lens** draws on combination of the experiential learning-commitment interplay, which is the driving mechanism of Uppsala's internationalisation process model with a similar experiential learning-commitment mechanism focusing on business network relationships. **Data collection** through in-depth interviews with Process Manager – R&D, Cluster Market Manager, Communication and Information, Cluster coordinator took place in the Swedish cluster **Future Position X (FPX) - a leading cluster organisation in Europe within geographical information. Findings show that** FPX was building international links with similar clusters in the Nordic, Baltic, and European countries. FPX later learned that for it to be in forefront of innovation, it needs to mix its own core competences with very complementing technology areas of the biggest hotspots in the world in Geo Spatial technologies. **Conclusion remarks and implications:** A sustainable internationalisation platform created by cluster is of utmost importance these days because digitalisation is fundamentally disrupting traditional industries, labour markets and the global economy, and transforming various facets of exchange. To companies, this means opportunities for new or changed business models, spanning from marketing and sales channels to logistics. **Originality:** This study contributes to the literature examining location can help firms to increase their competitiveness and thus supporting them in getting access to global value chains and new markets, by focusing solely on exogenous activities which serve to improve cooperation with global markets, that are critical to cluster dynamics.*

Keywords: Cluster's internationalisation, Internationalisation process, formal and informal networks, Future Position X (FPX), Digitalisation, Small and Medium-sized Enterprises

INTRODUCTION

In today's networked world (LeMahieu et al., 2017), turbulence, unpredictable uncertainty, and ambiguity are more the norm than the exception. So, a pertinent form of strategising is called for, one

that differs from strategic approaches developed for less turbulent and more stable contexts, where organisations of various forms are less tightly connected to each other than is the case today (Awa et al, 2011). This study explores and explains a form of strategising that is fit for purpose in such conditions.

The basic premise of this study is that the fundamental mechanisms used to explain the internationalisation process of firms, cluster organisations, educational institutions and other types of organisations are at parity or equivalent. Hence, we consider theories and models used to explain internationalisation process of for profit and non-for-profit organisations to be at *pari passu* or on equal footing. While extant literature focuses on the concept of internationalisation of clusters from the perspective of the tasks they perform, and their links with international partners (Xu and McNaughton, 2006; Prashantham, 2008; Pla-Barber and Puig, 2009; Carneiro Zen *et al.* 2011; and Richardson *et al.* 2012; Carneiro Zen et al., 2016; and Ślepko, 2012), this study illuminates how a cluster's internationalisation platform is used as a catalyst to leverage its entire innovation system to an international level. Thus, integrating the cluster with global innovation networks and international matchmaking and capitalization so as to get more links to investment capital for the companies in its platform. This will invariably increase the international links for startup companies and the regional innovation system.

The gap in literature is attributed to the fact that the impact of clusters on the internationalisation of cluster firms (Caputo *et al.* 2016) and the degree to which cluster activities improve collaboration and interaction between Firm-to-Firm, Firm-to-Research, Firm-to-Education, Firm-to-Capital and Firm-to-Policy, has received tremendous coverage in extant literature (Sölvell, 2009; Lindqvist et al 2013; Xu and McNaughton, 2006; Prashantham, 2008; Pla-Barber and Puig, 2009; Carneiro Zen et al. 2011; Richardson et al. 2013; Lamotte, 2014; Jankowska and Główska, 2016; Valdaliso et al , 2016). In other words, previous studies have mostly addressed internal gaps hindering effective mobility and collaboration inside clusters, to the detriment of external gaps vis-à-vis collaboration and interaction with global markets. This perspective has gained prominence because digitalisation combined with globalisation enables internationalisation by firms and clusters on a global scale (Caputo *et al.*, 2016). To Swedish firms, this means opportunities for sales to customers worldwide. Conversely, to foreign companies this facilitates sales in Sweden. Both international and domestic competition toughens, as Sweden becomes part of a global market.

The following research question is used to guide the exploratory nature of this study:

RQ: What platform does cluster organisation create to enable its internationalisation process in order for its partner's organisations (SMEs) to effectively manage the challenges brought about by the cataclysmic changes in business logic in the age of globalisation and digitalisation?

This study aims to shed light on exogenous gaps that are critical to cluster dynamics (Morgulis-Yakushev and Sölvell, 2017). Thus responding to recent calls (Jankowska and Główska, 2016; Valdaliso, Elo and Franco, 2016) for more research on gaps that are alien to the cluster, consisting of cross-cluster gap barring collaboration and interaction with firms in other clusters, and, most especially, the global market gap barring collaboration and interaction with global markets.

THEORETICAL LENS

Extant literature makes distinction between formal and informal networks (Forsgren, 2002, Hill, McGowan & Drummond, 1999). Forsgren (2002) described the formal network as a business network comprising a number of actors, linked with one another through different kinds of relationships. Johanson and Vahlne (2009) believed that also the current market is a network where actors are linked with one another, and in which a company must be active in order to establish itself on a new market. Furthermore, becoming established in a relevant network might result in an increase in knowledge, opportunities, and trust, resulting in an increased profit in the companies. Hill et al (1999) defined informal networks as social networks, incorporating relationships and alliances with people in society, outside the work place. Informal networks can furthermore create opportunities to develop SMEs, and might be viewed as an invisible asset. It is thus of great importance to be part of a large network, since that creates more opportunities as compared to small networks (Granovetter, 1973). Adrichivili, Cardozo, and Ray (2003) argued that informal networks might yield advantages for the company when identifying new markets.

Research concerning the significance of networks in connection with companies' internationalisation is abundant, though with divergent conclusions. Coviello and Munro (1997), Zain and Ng (2006), and Ojala (2009) argued that more research on the subject is required. Furthermore, formal as well as informal networks are of importance to the internationalisation process of organisations. Ojala (2008), Eberhard and Craig (2013), and Jeong (2016) claim that more research nonetheless is required in order to establish in what manner these network forms affect the internationalisation. Zhou, Wei-ping, and Xueming (2007) called for research around the linkage between the two network forms. In addition, there is a gap in the literature in terms of research on whether formal and informal networks unite during internationalisation.

Although understanding innovation in the context of the current changing industrial landscape in the age of digitalization has become cumbersome, and necessitates serious challenges to traditional internationalisation models (Luostarinen, 1994; Cavusgil, 1980; Bilkey and Tesar, 1977; Leonidou and Katsikeas, 1996; Johanson and Vahlne, 1977, 1990, 2003) our theoretical lens draws on Uppsala internationalization model (Johanson and Wiedersheim-Paul, 1975). The central tenets of the model

are how organizations learn and how their learning affects their investment behavior (Forsgren, 2002). Another important aspect of the Uppsala model is that it describes the internationalization of a firm as a gradual process. However, it is pertinent to mention that the number of people with extensive experience of international trade has also grown, meaning that firms can easily hire the competence they require rather than creating it themselves (Hollensen, 2007; Hill, 2003; Wild et al., 2007). Osarenkhoe (2009) propounded that “in an evolving international economy dominated by growing global integration, emerging fragmentation of traditional markets into global niches, and the birth of new competitive spaces thanks to technological developments, the steps and modes of foreign markets entry could experience significant deviations compared to the internationalization patterns of firms characterized by a series of incremental decisions, experiential learning and risk aversion, as envisaged in the traditional sequential models” (p. 287)

Internationalisation of firms has attracted great attention over the past decades (e.g. Johanson and Vahlne, 1977, 1990, 1992, 2003, 2009; Johanson and Mattsson, 1988; Dunning, 2000; Sun, 2009). However, this is not the case with small and medium-sized enterprises (SMEs). Hammond and Groose (2003) stress that international business activities should be seen as a continued development of firms’ competitive capabilities, which in turn enable them to compete successfully against rivals from and within different countries. As a growing number of SMEs have started operating on an international level (Coviello and McAuley, 1999; Chetty and Campbell-Hunt, 2003; Arte and Barron, 2016), it is important to understand how SMEs handle this challenge with their limited resources. Hence, Ngoma, Abaho, Nangoli and Kusemererwa (2017) investigated entrepreneurial orientation (innovativeness, proactiveness and risk taking) as a predictor of internationalisation of small- and medium-sized enterprises (SMEs), and established a significant relationship between the dimensions of entrepreneurial orientation and internationalisation of small- and medium-sized enterprises.

Both economic research and current business policy debate stress innovation as a key requirement to economic growth. Innovation is described today as an interactive process that rarely occurs within the confines of a single company or organisation (Inauen et al., 2012; Windrum et al., 2016; Sergeev, 2017; Bolaji Ilori et al, 2017). Rather, innovation is often a result of combining the resources of a multitude of actors in new constellations, where the goal is to generate value for everyone involved. Against this backdrop, digitalisation is fundamentally disrupting traditional industries, labour markets and the global economy (Koren, 2008). We are experiencing a digital revolution that transforms the world as we know it (Plesner and Raviola, 2016; Pinho and Pinheiro, 2015; Preston and Rogers, 2012; Quinn, Dibb, Simkin, Canhoto and Analogbei, 2016). Traditional business models and value chains are challenged as digitally performed activities allows for increased availability, shorter lead times, faster time-to-market and lower transaction costs. This translates into

opportunities for lower overall costs, allowing smaller companies to compete with well-established companies and brands (Holmlund, Strandvik and Lähteenmäki, 2017). Simultaneously, customer expectations mount with increased transparency, and competition increases across sectors.

As mentioned above, networks can be divided into formal and informal networks, and Jeong (2016) maintains that earlier research agree in terms of how the two forms may be defined. Formal relationships are described as company activities between actors within a network, while informal relationships can be defined as personal relationships (Ojala, 2008). Zhou, Wei-ping, and Xueming (2007) moreover argued that actors' informal networks generate extended knowledge about foreign market opportunities, counseling, and experience-based learning along with trust and loyalty. By being active in formal networks, companies are able to utilize each other's resources and competences with the purpose of performing tasks. Companies may however act on their own initiative, which results in increased costs and higher risks for the companies. Informal as well as formal networks both proffer various advantages (Fernhaber & Li, 2013).

METHODOLOGY

This study aims to shed light on exogenous gaps that are critical to cluster dynamics. Consequently, we describe the platform created by cluster organisation to enable its internationalisation process in order for its partner's internationalisation to effectively manage the challenges brought about by the cataclysmic changes in business logic in the age of globalisation and digitalisation. Data collection took place in **Future Position X (FPX). FPX initiates and supports research and innovation projects as well as helps companies and organisations to reach new markets.** Primary and secondary data sources were used in this study. Secondary data entailed a review of various evaluation reports. Primary data were collected through in-depth interviews with Process Manager - R&D, Cluster Market Manager, Communication and Information, Cluster coordinator, outward internationalized firms and inward internationalised firms at **Future Position X.**

A roundtable talk that took place in conjunction with the visit of international expert evaluators, sent by Vinnova (Sweden's Innovation Agency), to evaluate the first three years of FPX's Geo Life Region. A co-author of this paper was among senior researchers in Sweden invited to represent research and academic institutions with focus on the competitive edge of research and knowledge development – strategy and results". The other co-author was invited to participate in workshops with FPX and SMEs to discuss internationalisation. In other words, invited researchers represented the collaboration and interaction between Cluster-to-Research and Cluster-to-Education.

After the conclusion of the roundtable meeting with external evaluators of FPX, another roundtable talks with process leader of cluster initiatives, regional and local networks was conducted.

The duration was two hours during two separate occasions. Answers our questions facilitated an understanding of how cluster's formal and informal networks amalgamate during establishment on an international market. In other words, to shed light on exogenous gaps that are critical to cluster dynamics (Morgulis-Yakushev and Sölvell, 2017).

Transcripts were created from the tape recorders from various interview sessions. Questions were asked in an interactive group setting where participants were free to talk with other group members. The discussion was loosely structured, and free flow of viewpoints was encouraged on the main theme for discussion, which were solely based on the research questions. Having key themes and sub-questions in advance lies in giving the moderator or researcher a sense of order from which to draw questions from unplanned encounters (David and Sutton, 2004).

Data analysis

Data collected was analysed in three steps: data reduction, data display, and conclusion drawing (Miles and Huberman, 1994). Data reduction entails selecting and excluding/filtering data in order to focus, discard and organize the data in such a way that conclusions can be drawn and verified (ibid.). As for the tape- and video-recorded interviews, this analysis process began while transcribing the interviews. The aim of data display is to organize the data into a compressed assembly of information to elucidate appropriate conclusions and action. Accordingly, main themes, in our case the focus, objectives, activities and organisation of the clusters and networks, were extracted so as to provide succinct insight on the salient features of the cluster initiatives, regional and local networks in the region studied. Conclusion drawing and verification focuses on reflecting and understanding the data chosen for display. Although the process began at the initial stage, this step became more dominant during the later stages of the research. Despite the fact that the three steps are viewed as separate processes of analysis, it is important to note that the processes were going on simultaneously in this study.

PRESENTATION AND DISCUSSION OF FINDINGS

The prevailing reason for FPX to consider an international scope was to keep its lead in technological development, identify upcoming market needs, properly reacting to transformation processes and to strengthen its own position on markets worldwide. From the beginning, FPX was building the international links with similar clusters in the same technology area in Nordic, Baltic and European countries. Nevertheless, later learned that for FPX to be in forefront of innovation, it needs to mix its own core competences with very different technology areas. FPX built relationships with a number of the biggest hotspots in the world in Geo Spatial technologies. Thereafter, it started to build new relationships with complementing knowledge and hot spot centers, like the mobile and new

media industry in Malmö, the digital media and gaming industry in China, the health industry in Beijing and Australia, the sports industry in Åre and Barcelona and Melbourne. This is enabling FPX to work with cross cluster international innovation and importantly supports the strategy of 'innovation within the gaps'.

Findings show that FPX has, since 2005 had an internationalization strategy and since 2012 a 'Born Global' vision for the spin-off companies coming out of its innovation system. FPX has a focus on the largest economy in the world, the Chinese market - a market with great potential and with a high psychic distance. Thus, FPX internationalisation strategy is in sharp contrast to the core assumption of Uppsala model (Johanson and Wiedersheim-Paul, 1975) that an entity starts its foreign operations in countries with low psychic distance. In other words, organisations favour countries that share similar environment with their home country. FPX has encouraged Gävle city to set up sister city relations with Zhuhai City in south China – the region in the world with the highest growth rate and that is also known as the factory floor of the world, Guang-dong.

FPX's "global mindset, which is in line with entrepreneurial orientation (innovativeness, proactiveness and risk taking), is epitomised in the study by Ngoma, Abaho, Nangoli and Kusemererwa (2017), resulted in several new agreements with partners to ensure that they have the resources and expertise available for their activities and channels to investment capital and platforms for companies' international expansion. The prevailing reason for FPX to consider an international scope was to keep its lead in technological development, identify upcoming market needs, properly reacting to transformation processes and to strengthen its own position on markets worldwide. Fernhaber and Li (2013), who suggested that by being active in formal networks, companies are able to utilize each other's resources and competences with the purpose of performing tasks, support this strategic decision by FPX.

Our findings show that in the beginning, FPX had an internationalisation strategy which concurs with Johanson and Vahlne (1977 & 1990), who studied the internationalisation behavior of Swedish firms and found that they follow a sequential process. FPX was building the international links with similar clusters in the same technology area in Nordic, Baltic and European countries. Hence, it first entered country markets with low psychic distance. Combined with the experiential learning-commitment interplay as the driving mechanism from their previous internationalisation process with a similar experiential learning-commitment mechanism focusing on business network relationships (Johanson and Vahlne, 2003), FPX entered markets with high psychic distance.

Having learned that to be in forefront of innovation, FPX decided on mixing its own core competences with very different technology areas. Furthermore, its realisation that being active in networks will facilitate identification of opportunities that further govern its choice of entry modes

and entry nodes (Albaum and Duerr, 2008; Koren, 2008; Sandberg et al., 2015; Galkina and Chetty, 2015; Jeong, 2016) when undergoing internationalisation. In compliance with Zhou, Wei-ping and Xueming (2007) who argued that actors' informal networks generate extended knowledge about foreign market opportunities, counseling, and experience-based learning along with trust and loyalty, FPX built relationships with a number of the biggest hotspots in the world in Geo Spatial technologies. Thereafter, it started to build new relationships with complementing knowledge and hot spot centers, like the mobile and new media industry in Malmö, the digital media and gaming industry in China, the health industry in Beijing and Australia, the sports industry in Åre and Barcelona and Melbourne. This is enabling FPX to work with cross cluster international innovation and importantly supports the strategy of innovation within the gaps.

CONCLUDING REMARKS AND IMPLICATIONS

This study aims to facilitate understanding of how cluster's formal and informal networks amalgamate during its international establishment. It is recognised in this study that clusters act as real "springboards" for firms, especially small and medium enterprises (SMEs) to help them in increasing their competitiveness and thus supporting them in getting access to global value chains and new markets (Meier and Zombori, 2011). Cluster participants can benefit from specialised business support services of cluster organisations stimulating and organising these actions. In particular, if firms have to increasingly integrate their activities into global value chains in order to become and remain competitive, being part of a cluster is supportive (Pavelkova, *et al.*, 2015). Clusters in the emerging industries face the needs for internationalisation. Consequently, transformation processes within value chains, brought about by digitalization, urge clusters to think global and internationalise accordingly.

Clusters' internationalisation is essential to their activity or even their very existence. The level of those activities then has a decisive influence on the competitiveness of clusters' firms, and it is a showcase of cluster organisation managers' ability to coordinate and administer those activities. The journey from initial idea to market-ready product or commercialisation of innovation, which is key to entrepreneurial success, is uneven, indirect and has many twists and turns. The path is plagued with many obstacles and possible entry and exit points. The participants in clusters are mainly SMEs, and they are often devoid of time, resources, knowledge, and international market experience and networks required to singlehandedly embark on the journey to go international. This is the rationale why cluster organisations can provide customised supporting measures and tools to the cluster participants on their paths towards internationalisation, as they usually have more resources at their disposal and are more experienced in internationalisation matters. A common understanding within

clusters (e.g. FPX), a sophisticated internationalisation strategy and a consequent implementation of related actions are the prevailing key success factors for internationalisation of clusters. This requires specific cluster manager internationalisation skills for building long-term transnational and cross-sectoral cluster partnerships.

A sustainable internationalisation platform created by cluster is of utmost importance these days because digitalisation is fundamentally disrupting traditional industries, labour markets and the global economy (Einsiedler, 2013; Lee & Kao, 2014), and transforming various facets of exchange (Hagberg *et al* 2016). To companies, this means opportunities for new or changed business models, spanning from marketing and sales channels to logistics (Ivang *et al*, 2009). Traditional business models and value chains are challenged as digitally performed activities allows for increased availability, shorter lead times, faster time-to-market and lower transaction costs (Holmlund *et al*. 2017). This translates into opportunities for lower overall costs, allowing smaller companies to compete with well-established companies and brands. Against this background, collaborative development environments (Mendikoa *et al.*, 2008; Lin *et al.*, 2012), such as FPX internationalisation platform, gain importance especially for small and medium enterprises (SME) with limited resources. This reinforces a need for clusters and firms to develop their management of interactive innovation processes.

Implications of this study are that internationalisation of clusters gains a new dimension and quality, if the future transnational collaboration and interaction is driven by a deep understanding of ongoing transformation processes in respective value chains – a process which is a sequel to digitalisation and globalization (Hagberg *et al*. 2016). It is obvious that such transformation processes or digitalisation process may have different dynamics in different regions (Holmlund *et al*. 2017). Therefore, clusters should focus their international and global partnerships on those regions with the highest dynamic. This is one important pre-condition to successfully conquer related markets or initiate cooperation with sustainable impacts. Furthermore, this study demonstrates that cluster companies can leverage on internationalisation operations performed by cluster organisations.

FPX global network serves to help the small and medium sized companies reach new markets and commence international business. FPX also inspire international companies to establish themselves in Gävle and further strengthen the GIS-environment in the region. The prominent ends attained by FPX internationalisation include increased access to knowledge, market, and key infrastructure. Internationalisation also helps FPX to get access to new business partnerships and collaborative research. In addition, internationalisation enlarges its knowledge base by sourcing knowledge, technology and skills from other locations than their traditional environment.

Transformation processes within value chains urge clusters to think global and internationalise accordingly.

This study offers insight into internationalisation of cluster in a Sweden context. It bridges the approaches to firm internationalisation with the theory of clusters. This is the first study to incorporate discussions on digitalisation in cluster internationalisation. This is particularly important because to succeed in the global marketplace, SMEs must put digitalisation in the center of their international strategy. Furthermore, by focusing solely on exogenous activities which serve to improve cooperation with global markets, that are critical to cluster dynamics, this study contributes to the literature examining location can help firms to increasing their competitiveness and thus supporting them in getting access to global value chains and new markets.

UNIVERSITY-INDUSTRY INTERACTION: EVOLUTION, NECESSITY, BARRIERS AND PROSPECTS

Ovchinnikova, Natalia¹; Ovchinnikova, Oxana²; Kokuytseva, Tatiana²

¹Independent researcher, Moscow, Russia

²Department of Applied Economy, Peoples' Friendship University of Russia, RUDN University, Moscow, Russia

ABSTRACT

The main goal of the presented research paper is to find solutions to existing problems in the field of interaction between the university and the industrial sector. This goal is achieved by solving the following tasks:

- 1) analyze of the evolution of university-industry interaction;
- 2) analyze of the situation in the field of university and business / industry interaction;
- 3) focusing on the need for universities - industry cooperation and identifying key barriers in their interaction;
- 4) consideration of formats for university and business / industry interaction.

The objectives of this article are achieved through a review of the existing literature, a synthesis of the necessary knowledge about the interaction of the university and the industrial sector, the analysis of the need for interaction, key barriers, and interaction formats to formulate proposals that improve cooperation and identify the most effective ways of partnership. This analysis covers the following documents: information and analytical sources, research projects of predecessors, data from international research organizations, and historical documents.

Keywords: university-industry integration, the triple helix, higher education, regional development.

INTRODUCTION

The economy of the Russian Federation continues to be in a crisis and its formation as an independent unit directly depends on the development of the research and technological components, especially in the conditions of a knowledge-based economy. The leading supplier of innovative products is universities. Universities need to respond in a timely manner to external challenges and to point out to advance not only at the regional level, but also to go beyond it. However, as soon as the university starts to work in this direction, higher educational institutions encounter significant obstacles in the way of establishing partnership with innovative enterprises, as well as they face problems in the development of innovation activities within the university and beyond.

The key issues which universities facing can be identified by the following points:

- the majority of research conducted at the university level does not meet the requirements of industry and the real sector;
- the majority of R&D is developed in the framework of grants that are not aimed at further commercializing or introducing them into production;
- researchers are not interested in developing working innovations (which will be applicable and commercialized);
- entrepreneurial spirit in universities is not stimulated in the field of research and innovation.

As for the gap in the representation of innovations by industry and universities, they are faced with a fundamental misunderstanding on both sides, which significantly reduces the interest of actors to each other and inhibits the development of scientific and technological progress. In the Address of the President of the Russian Federation to the Federal Assembly of March 1, 2018, special attention was paid to the development of technologies, knowledge and competencies. Crucial role in this process plays a university, ranging from career-oriented work and ending with fundamental applied research and development. Russian President Vladimir Putin noted that technological development should be lean on a strong base of fundamental science, as well as the need to enter a fundamentally new level in the research infrastructure. It was noted the need to create powerful scientific and educational centers that would integrate the capabilities of universities, academic institutions, and high-tech companies. That is why this research is significant and relevant for the modern stage of economic development.

EVOLUTION OF UNIVERSITY-INDUSTRY INTERACTION IN RUSSIA

The time line of interaction between university and industry in Russia presented on the Figure 1. It shows how university-interaction model has been changing through years. Summarizing description of different time periods, we can mention that three main types on the evolution: Soviet Union, Post-Soviet Union and Russian Federation. Back in 1987, before the collapse of the USSR, all scientific organizations were transferred to self-sufficiency, which significantly changed their model of interaction with industry and others actors. Along with the growing need to conclude contracts with industry for scientific research, the material and technical base wasn't updated, which was reflected both in the lack of enterprises interest to invest financial resources and in the capacity of institutions to fulfill the orders of industry. In 1993, the Constitution of the Russian Federation was adopted, after which significant changes became evident not only in the education system, but also in the country as a whole. A drastic change in the ideology of education has led to the need for retraining of humanities teachers and to give less attention to the development of partnerships with industry. Industry at the time was also in a crisis and funding for research and development couldn't be included in its

expenditure items. After 2000, a new reform of education was adopted and it didn't have the expected effect. Up to 2011 there was a delay in technological modernization of science and insufficient funding of research developments.

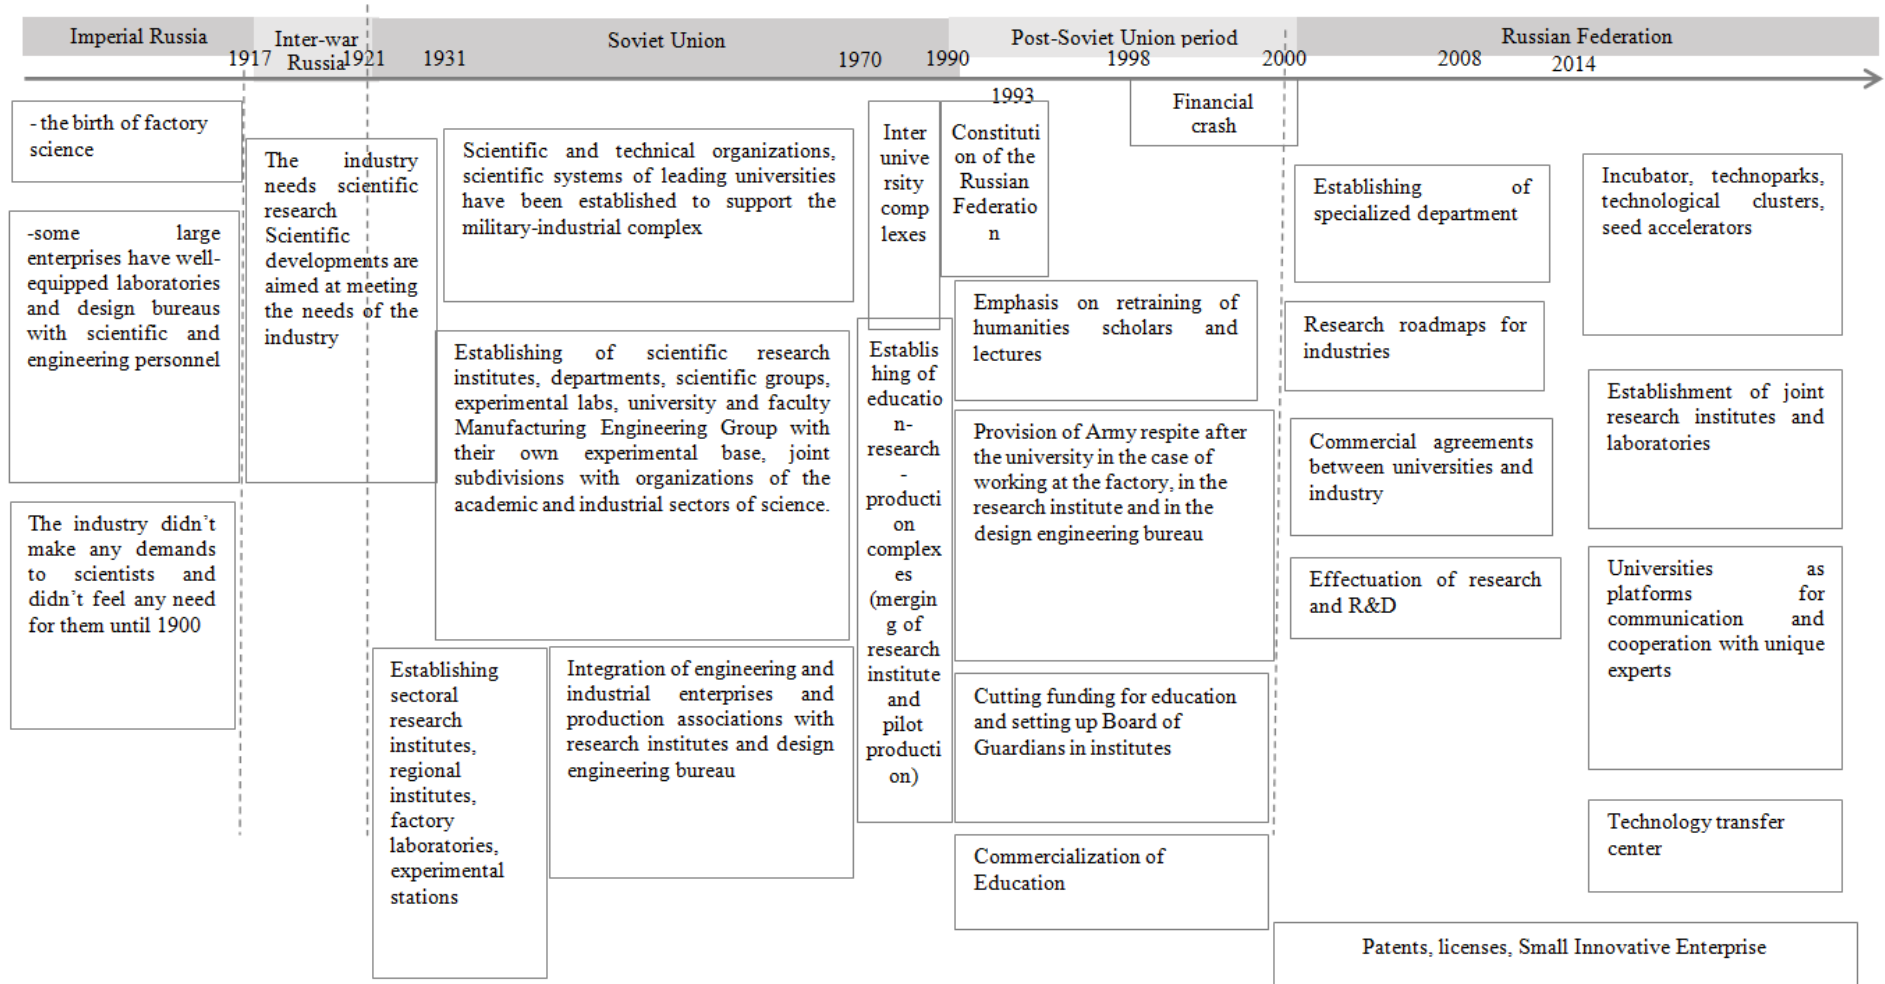

Figure 1. Evolution of university-industry interaction in Russia

The report "Monitoring of the economic situation in Russia", which was published on January 2018, says that more people with higher education are leaving Russia nowadays and this has a crucial influence on technological progress. According to the data presented in the report "Qualified migration in Russia: the balance of losses and acquisitions", the total number of educated Russian emigrants is about 800 thousand people and this number is growing each year. According to the Federal State Statistics Service, the number of high-performance jobs is reduced annually by 900,000 units and simultaneously, there are lots of head hunters trying to find the right person for their job position. Such imbalance on the labor market leads to the serious problems in economics and technological development.

The share of domestic expenditure on research and development in GRP is reduced by 0.04% annually. The domestic expenditure on research and development fluctuate within 1% of the gross domestic product in the whole of the Russian Federation. The share of organizations that carried out technological innovations in the reporting year in the total number of organizations surveyed as a whole for the Russian Federation is reduced by approximately 0.7% annually from 8.3%. During the period from 1990 to 2011, the number of researchers fell by about 2.6 times, which negatively affected the country's research potential. A serious impetus in the development of relations between universities and industry was the period of the sanctions regime in 2014, which allowed cooperation and interaction of universities and industry to enter a new stage in order to obtain new performance results and modernize existing processes.

CURRENT SITUATION IN R&D IN RUSSIA

The number of active patents fell by 9,496 units in 2016. According to BCG, the deficit of qualified personnel in Russia will be 10 million people until 2025. According to the Federal State Statistics Service in 2016, the number of graduates of bachelors, specialists, masters is 972 400 people. From the data listed above, we see the gap between reproduction of professionals the needs of the market, taking into consideration the fact that some of the highly professionals are leaving abroad. This situation is also because the level of education in universities that lags behind the demands of the market and advanced research trends. Table 1 shows the number of organizations engaged in research and development and, unfortunately, their number isn't sufficient to fully reproduce new knowledge and train professional staff.

Type of organization	Change in the number during the 10 years (units)
R&D organizations	-376
Design organizations	-178
Research project organizations	-32
Pilot plants	+13
Higher education institutes	+562
Industries, having scientific research, design and engineering divisions	+108
Others	+313

Table 1. The number of organizations performing research and development

Universities and industry interaction are based on the fundamental factor that can be named “university research and development involvement”, which will be useful and important for industry. The financing of science from the federal budget for the last year decreased by 36,670.5 million rubles. Expenses for civilian science from the federal budget as of 2017 amount to 402,722.3 million rubles to the expenditures of the federal budget for the last year decreased by 0.36% and amounted to 2.45%, and to the gross domestic product for the last year decreased by 0.06% and amounted to 0.47%. These figures demonstrate the need for a reorientation of the university research base on alternative sources of financing, especially to increase the importance of cooperation with industry and business sectors. Despite the fact that the intensity of research activities remains low, the increase of domestic expenditure on research and development in higher education has almost doubled (Figure 2).

Figure 2. Addition of gross domestic expenditures on R&D (by performing sector) against 2007 (Index 2007=100 constant USD PPPs)

From the information above we can see the importance of developing university-industry interaction in Russian Federation. The data above shows the importance of new technologies and knowledge exchange between the higher education instituters and industry. Without them it will lead to the lowest level of graduates and technologies in business.

IMPORTANCE OF UNIVERSITY-INDUSTRY INTERACTION DEVELOPMENT

From year to year governments around the world tried to support an innovation efficiency and enhance wealth creation with the help of university-industry interaction. (Barnes, Pashby & Gibbons,

2002). In 2001 the group of scientists (Hall, Link and Scott in 2001) mentioned that a misunderstanding between universities and industry leads to research that do not use in the real life and to industries that have no innovation in their processes. It is necessary to pay attention to government and institutional strategic policies if we want to solve the problem in university-business interaction. The relevancy of university – industry interaction for universities and industry presented in Table 2.

Universities	Industry
Acts according to innovation development government policy	Develop the company according to innovation development government policy
Have an opportunity to use modern equipment and prepare students to real work places	Have an opportunity to hire the best students and faculty members
Reduction of youth unemployment	Reduction of youth unemployment
Receiving additional funding (other than the state and sharing the costs of research activities)	Accelerate the process of innovation
Availability of feedback from the industry and mentoring by industry and business	Prevention of additional infrastructure costs and hiring of specially trained personnel, or retraining "on-site"
Availability of researchers working in enterprises and receiving newest information about the leading trends and market demands	Problems arising in companies solve by combining intellectual resources between industry and university (competencies and skills); the industry receives the best staff (talented graduates) on the basis of cooperation and knowledge of the university students' contingent
Elimination of risk and uncertainty due to inconsistency of inquiries of the university industry	Creating new opportunities and competitive advantages in connection with access to new research and start-up ideas
Availability of access to practical knowledge from the industry and research base development basis of the gained knowledge	Availability of access to the network of teachers, leading scientists and specialists; new opportunities in cooperation with other companies interested in the same university-based research and cost sharing
Gain new knowledge about curricula development	Evening-out financial losses (according to the IUCRC program, every dollar invested in the partnership is used 40 times)
New practical-based research leads to increase of publishing papers	Availability of access to the latest research and development conducted by the scientific community
Growth of entrepreneurship among students and faculty staff	Concentration of necessary competencies within the existing team of specialists, supplemented by university staff
Promote innovation (through technology exchange)	Elimination of difficulties in accessing external sources of research funding, which significantly reduces their cost
Act according to regional and national economy needs	New opportunities for technological development in conditions of sanctions

Table 2. The relevancy of university-industry interaction

In Table 2 we analyzed that both universities and industry have its own pluses of this integration. But it also important to understand the outcomes of this interaction. First things first, economic results are pivotal for university-industry interaction and its influence on regional development. Universities broaden their horizons and begin to be entrepreneurial and earn money. Furthermore, practical based

research help universities to have different patents and licensing income. Universities became a part of regional economic development and a point of growth. For industry it gives an opportunity to create or improved new products or processes. It is also good point about patents, prototypes, etc. It is much cheaper for industry to conduct research with the help of university than in-house. In the world of competitiveness, it will be better to cooperate with universities because it will give an opportunity to get ahead of other companies. It is also promoting economic growth. Simultaneously, university-industry interaction helps to enhance reputation for both of them and service to the community.

We can not argue that this type of cooperation has great influence on institutions as itself. If we are talking about universities, they have an opportunity: to have a joint publication; to have a base of practical problems that can be solved by students and faculty members; to provide a “test bed” for feedback on research ideas and results; to have an access to up-to-date equipment; students can have practical experience while they are studying; to build credibility and trust for the academic researcher among practitioners. As for industry, there are more advantages of cooperation with universities such as keep up-to-date with technological progress; accelerates commercialization of technologies and increases speed of innovation to market; provide much needed legitimacy for industry products (e.g. software); access to new knowledge and leading edge technologies; access to specialized consultancy; professional development; opportunity to access a wider international network of expertise; act as a catalyst that leads to other collaborative ventures; hiring of talent graduates. (Ankrah, Samuel & Al-Tabbaa, Omar, 2016)

The need for cooperation between universities and industry is growing every day, which is confirmed by all the facts above.

BARRIERS ON THE WAY OF UNIVERSITY-INDUSTRY INTERACTION

However, despite the need to develop partnerships between these areas, there are barriers that are getting in the way of effective interaction (Table 3).

University	Industry
Negotiations on intellectual rights and other contract conductions are difficult to complete with a result that suits both sides. The process isn't transparent and takes a lot of time.	
Lack of funding	
Business and university work in different time contexts.	
Lack of trust or understanding	
Low overall level of business investment in research and development, including lack of absorbcency	
University indicators, including citations, determine the priority of producing high-quality	Business focuses on short-term rather than long-term R&D

publications	
Other pressure on grad days (teaching and research) limits resources for cooperation.	Business finds a difficult to define academic partners or academic ability.
Cooperation experience isn't assessed as a part of progress in academic career.	Lack of alignment of objectives: tensions between business and university needs / objectives.
Lack of time / resources for establishing cooperative networks or project development	Lack of understanding by business of the potential benefits of working with universities
The tension between the academic desire to publish research results and business problems regarding competition	Other problems with financing (for example, compliance with the requirements of small and medium-sized businesses)

Table 3. Barriers in the university-industry interaction

These barriers are key barriers to the formation of a successful university-business partnership. Despite the many difficulties that exist in the modern world, the formats of university-business interaction have evolved and are currently being formed into five formats of possible partnerships.

UNIVERSITIES-INDUSTRY INTERACTION FORMATS IN RUSSIA

If we consider the evolutionary line of interaction formats between the university and industry, then one of the first classifications is presented by Santoro, M. and Chakrabarti A. and includes four types of interaction (Santoro and Chakrabarti, 2001):

- 1) supporting of research through the allocation of financial resources, the use of equipment, the creation of charity trust funds for the renovation of university laboratories and the provision of scholarships for the implementation of new promising projects;
- 2) conducting joint research on a contract basis with the participation of researchers or staff engaged in consulting services, as well as the establishment of research groups specifically designed to solve business problems;
- 3) knowledge transfer through formal and informal interaction, cooperation in the field of education, curriculum development and staff exchange;
- 4) technology transfer is focused on solving a specific business problem when the university is engaged in research and development, being an expert, evaluating and promoting the technologies necessary for the market (patents, licenses).

Later, Davey, T., Baaken, T., Galan Muros, V. and Meerman, A. (Davey *et al* , 2011), presented an expanded list of interaction formats, which comprised the following items: joint scientific research; commercialization of R&D results; mobility of students and employees - the dissemination of knowledge and technology through the exchange of students and teaching staff between universities

and enterprises; development of joint training programs, including courses, special guest lectures and seminars; life-long learning and development of competences and skills, including extended education, training and mentoring; entrepreneurship - active involvement of universities in the creation of new enterprises and development of entrepreneurial thinking among students and scientists as a result of interaction with business structures; management - scientists from universities participating in companies' decision-making and from the side of management positions; on the other hand, business representatives participate in the management of university departments, and so on.

In 2017, this list was optimized and clustered by Paola Rücker Schaeffer, Andréia Cristina Dullius, Rodrigo Maldonado Rodrigues, Paulo Antonio Zawislak (Schaeffer *et al*, 2017) and represents five key clusters through which mutually beneficial cooperation takes place. These formats of cooperation applicable to Russian system with some additions mentioned in Table 4.

	Definition
Education-oriented	provision of educational services on a short-term or long-term basis. This form of interaction doesn't imply long-term cooperation and can be in the form of short-term training both from the university and from the industry.
Intellectual property oriented	this type is granting of universities an object of intellectual property for use and receiving certain benefits for it. An example of such interaction is access to academic documents or the acquisition of patents. Patents may be included in this classification provided that the industry or the customer of the patent hasn't participated in its development
Service-oriented	the provision of services and / or equipment for use on terms of partnerships. Examples of such interactions include services such as technical advice and the use of funds provided by the partner, including laboratories and test materials.
Development-oriented	those are interactions aimed at joint technological development. The university unites with industry/business to solve any technological problem important for both sides. In this type of interaction, participants are active, even when the results are used only in the short term.
Research-oriented	this type of interaction is the most difficult. All participants must be active in R&D process. As a rule, it is based on long-term cooperation, which includes the creation of a research base, the formation of new knowledge and the implementation of joint projects. This format of interaction implies bi-directional flows of knowledge and information between universities and industries, as well as collective responsibility for the result.

Table 4. Different formats of university-industry interaction

The presented clusters of interaction formats are relevant for the majority of Russian universities, however, only a small amount is used in practice by them.

DISCUSSION

Nowadays, the world is at the point of bifurcation, which determines the choice of development vectors, changes and opportunities for both universities and the industrial sector.

Partnership in the modern world is characterized by the following features:

- Cooperation is carried out between "non-obvious partners".
- There are often dozens, even hundreds, of collaborating partners.
- Collaboration is often provided by digital and other rapidly evolving technologies, such as cloud computing in biotechnology. Digital technology can also allow "convergence" in different industries to create truly new solutions.
- There are many levels and ways of cooperation, ranging from strategic alliances and joint ventures to "intra-entrepreneurship."
- Players and relationships are developing quickly.
- There is availability of open source data and a culture of information sharing.

In the world of such partnership rules we mention that universities need to develop formats of university-industry integration to the current challenges. Simultaneously, universities are a very unchangeable organizational structure and novelty is always danger for it. This situation pushes universities to think about their future without additional government funding and the existence in the world of competitiveness.

This research shows the historical material about university-industry interaction which demonstrates some periods when cooperation decay and the next period needs to start over. However, it leads to a great gap in university-industry partnership in Russian from the other world. The material above demonstrates that the nature of partnership is changing and universities can't live in the same conditions for a long time. With the help of cooperation formats, we can suggest different models of cooperation for various of universities types.

As for business sphere, the need of cooperation is growing but the ability to invest in R&D research is decreasing. In Russia corporations have their own laboratories and corporate universities and they have no need to cooperate with universities. Small and mid-size business stay in another position when they have no much money for R&D and they try to do as much as they can without cooperation with universities. In these conditions it's very hard for universities to choose the right way in partnership and become more attractive for business and industry.

Both – universities and industry -have their own interest in cooperation and barriers, but what they need to do is to achieve their main goal - to overcome all hedges and find the most convenient way of integration.

IMPLICATIONS FOR THEORY, PRACTICE AND FUTURE RESEARCH

This article can serve as an analytical material for university management and researchers who want to develop their relations with the industrial sector in accordance with the needs of the regions, as well as understand the situation in this area and create favorable conditions for the development of partnerships (for example, the entrepreneurial sphere). The key limitation of this study is the impossibility of providing the testing results of the screw model relative to the universities in Russia due to the insufficient refinement of the model. This research should be continued as part of the finalization of the screw model and its formation and development in the field of interaction between universities and industry. The results of the research presented in this article can serve as an aid to the industrial sector development in regions through building the interaction "university-industry", considering possible barriers and priority areas of development.

Particular value this article demonstrates for universities that have the necessary resources (material, intellectual, technical) and their main goal is to establish the university as a driver for the development of the territory on which they are located. The originality of this article is a detailed analysis of the interaction of universities and industry, identifying the need for this partnership, considering the key barriers and ways of possible cooperation. The presented topic has not been studied in detail so far, which confirms the relevance of this research.

The research is carried out within the framework of the state task of the Ministry of Science and Higher Education of the Russian Federation No. 26.13445.2019/13.1 "Scientific and methodological, analytical and regulatory support for the implementation of the Set of Measures for 2018-2020 for the implementation of the Interstate Program for Innovative Cooperation of the CIS countries for the period until 2020".

The publication has been prepared with the support of the RUDN University Program «5-100».

EXPERIENTIAL MARKETING EFFECTS ON CONSUMER BEHAVIOUR: A MULTIDIMENSIONAL RESEARCH

Panigyraakis, George; Yerimou, Pantelitsa

Department of Public Communication, Cyprus University of Technology, CUT, Limassol, Cyprus

ABSTRACT

This research investigates the multidimensional concept of Experiential Marketing and its effects on consumer behaviour. To measure these effects, the authors used both secondary and primary data to investigate the emotions, perceived value, purchase intention, customer loyalty and the intention to recommend (WOM). The research was conducted in Limassol, Cyprus with Cypriot consumers that participated in an experiential marketing event. By testing five hypotheses, findings reveal that consumers have a positive attitude toward events of experiential marketing with the customer loyalty and perceived value being not as significant as the rest of tested variables. On a future study, researchers can investigate these effects on different cultures to find multicultural differences.

Keywords: consumer behaviour, emotions, experiential marketing, perceived value, purchase intent, loyalty, WOM.

1 INTRODUCTION

The field of Experiential Marketing has evolved over a period of time. The first who talked about marketing experiences were Holbrook and Hirschman (1982) according to which during the process of consumption the individual has an experience - a subconscious process that affects his behaviour. Schmitt in 2010, introduces the term Marketing Experience in the business and academic sphere, and adopts it as the new fascinating concept of marketing. On a later research, it was found that consumers are more satisfied from experiential purchases rather than material purchases (Gilovich et al. 2015). Experiential consumption affects a store's authenticity with the variables of perceived value and behavioural intention to play a significant role (Fu et al. 2018). Brands that engage a multisensory approach in their strategies are advantageous (Moreira et al. 2017).

Using sensory strategies in buying processes, drives on positive emotions towards a brand (Jamaluddin et al. 2013) and at the same they are positive for the brands' positioning consumers' minds (Foster and McLelland, 2015). "Human senses affect customer awareness and experiences in buying processes (Moreira et al. 2017). Purchase intentions is a variable tested by different studies. They can be "attitudes, evaluations and perceptions of brands" (Moreira et al. 2017, pp. 73).

To continue with, perceived value is a factor that plays an important role to decision making (Fu et al. 2018), as they can strongly influence it (Paraskevas and Andriotis, 2015). Perceived value can also be an essential variable on creating purchase intentions within a store (Jani and Han, 2014). The WOM tends to be a vital factor that influences consumer behaviour. Precisely, “WOM about a brand is of great importance” (Hatzithomas et al. 2018, pp. 478), whilst at the same time is the most unexplored in different studies (Heung and Gu, 2012).

2 LITERATURE REVIEW

2.1. *Experiential Marketing*

According to Berry et al. (2002), the customer experience is a result of joined elements that fit in the category of emotions. Such emotions engage smell, sight, taste, touch and sound in a particular environment. In a further analysis, these emotions are divided into three categories; functional, mechanics and humanics, where feelings are made up of things and humans respectively. The functional clues are referred to the technical quality of the good or service, the mechanic refer to the physical representation of the service environment and humanic from the behavior and appearance of the employees (Berry and Carbone 2007). Sensory marketing is under the umbrella of experiential marketing, and is as defined different strategies that involve consumers’ senses in a buying decision (Krishna, 2012). The aim of sensory marketing is to create experiences that stay in consumers’ minds, thus create a positive connection with the brand (Foster and McLelland, 2015). Some features of sensory marketing, are the use of colours, slogans and store’s design (Brakus et al., 2009).

Figure 1. *Experience Auditing Steps (Berry and CarbONE, 2007)*

2.2 *Perceived Value*

Perceived value refers to humans’ perceptions regarding products, services or brands (Mathwick et al., 2001). According to the same research, perceived value is based mostly on the products’ uses and benefits rather than the market price. Consumers rely on their needs’ satisfaction where perceived value deals with the human’s perceptions of a product (Verhoef et al., 2009). On a recent study by Hatzithomas et al. (2018), it was found that WOM has a significant role on the consumers’ perceived value.

2.3 Word of Mouth

The field of Word of Mouth (WOM) has seen a big attention over the years. According to He et al. (2008), WOM can be defined as the experiences by others which strongly influence the decision making of consumers. Either their recommendations are negative or positive, they both affect to the consumers' purchase intention (Hoye and Lievens, 2009). Friends and family are social groups with the greatest influence. Additionally, WOM also increases the revenues of a company, as consumers find it trustworthy and proceed to purchases (Brown et al., 2007).

2.4 Purchase Intentions

Purchase Intentions is a result of different elements in the decision making, that drives towards or away from buying a product (Zhao et al. 2008). As Grewal et al. (1998) discussed, purchase intention can be defined as the probabilities a customer has to purchase a product. WOM and perceived value, are marked as important variables that influence purchase intentions (Schiffman and Kanuk, 2009). Purchase intentions is the final stage of the decision-making process, which most of the companies are trying to influence (Hoy and Milne, 2010).

2.5 Customer Loyalty

Researches have highlighted the importance of customer loyalty, over the importance of customer satisfaction. Customer Loyalty can be defined as a repeat purchase towards a brand or product because of a loyal customer (Zeithaml et al. 1988). WOM which was discussed before, is closely related with customer loyalty because it is stated as a strong marketing tool (Brown et al., 2007). Organizations often measure their success by investigating the customer loyalty (Dick and Basu, 1994). Thus, researches use marketing strategies to enhance customer loyalty. At this point it must be mentioned that a hypothesis on WOM and Customer Loyalty is tested.

2.7 Research hypotheses

Depending on the Chapter 2 of Literature Review, all the variables discussed are tested by using hypotheses on the researchers results. The aim of the hypotheses is to accept or reject previous findings.

2.7.1 Hypothesis 1: The emotions caused by the actions of Experiential Marketing have a significant positive relationship and influence in Experiential Marketing

The first hypothesis is based on Experiential Marketing's emotional experiences (feel) (Schmitt, 1999). Generally, sensory experiences can positively affect the brand experiences (Streicher and Estes, 2016). Experiential Marketing actions are "empirically tested and confirmed as having a positive impact" (Wu et al. 2018, pp. 58).

2.7.2 Hypothesis 2: There is an important correlation between Experiential Marketing and perceived value

Schmitt (1999b) identifies the positive perceived value of Experiential Marketing as well as positive customer satisfaction. In the present survey we will check the accuracy of the above proposals in the Experiential Marketing events. Hypothesis two was based on the conceptual model of Addis and Holbrook (2001), which refers to perceived value in the form of credibility, ROI, entertainment, and will lead us to determine the degree of impact of Experiential Marketing on the perceived value.

2.7.3 Hypothesis 3: There is a positive correlation between perceived value and purchase intent

The third hypothesis was based on the conceptual model of Dodds et al. (1991), concerning the intention to purchase. According to the model of Dodds et al. (1991), based on the research by Szybillo and Jacoby (1974), found the strong correlation between perceived value and market intent. Rational and affective components are assumed to positively influence the perceived value of a brand (Prebensen and Xie, 2017).

2.7.4 Hypothesis 4: There is a positive correlation between the experiences the consumer derives through Experiential Marketing and WOM

The mouth-to-mouth interpersonal communication, Word of Mouth, has been studied in various fields, such as tourism (Gopalan and Narayan, 2010; Cetin and Dincer, 2013). The conceptual framework for this research has been adapted to the model of Ferguson et al. (2009), according to which the overall positive experience that a client derives from a service has a positive effect on a positive WOM. Additionally, "WOM has been confirmed to have an impact to a variety of decision-making stages" (Hatzithomas et al. 2018, pp. 478).

2.7.5 Hypothesis 5: There is a positive correlation between positive WOM and Customer Loyalty

Final, hypothesis 5 is based on the conceptual model of Zeithaml et al. (2009, pp.550), in which the positive WOM positively affects consumer loyalty.

3 METHODOLOGY

3.1 Instrument design and measures

For the collection of primary data, we have chosen to conduct a descriptive research with a research body on the questionnaire, as this method of data collection is faster and leads to more objective answers (Milne, 1999). The Likert scale of 5 points was extensively used. As far as the questionnaire is concerned, there is an initial filtering question that ensures that the participants in the survey have taken part in events or promotional actions in the form of Experiential Marketing.

The purpose of the questions was to measure the perception of the consumers about the 5 factors of Experiential Marketing. It is based on Schmitt's experiential marketing scale (1999), which refers to the experiential features: sense, feel, think, act, relate. We use five-level, balanced, single and forced Likert

scales, with extreme values that express absolute disagreement and absolute agreement. Data collection is followed by the analysis using the Statistical Package for Social Sciences (SPSS) analysis tool.

3.2 Sampling

To measure the effects of experiential marketing to consumers, the sampling unit consisted of Cypriot consumers who took part in an Experiential Marketing event, distributed in the area of Limassol, Cyprus during the period 26/11/2017 -22/12/2017. The sampling selected was non-probability, conventional (sample of convenience) due to the high accessibility. The sample size is 302.

4 RESULTS

To start with the demographic findings of this paper, 43% of the participants were university graduates and 20% high school graduates, while in employment 60% of the sample are workers and 12.5% are unemployed.

The first hypothesis of the research model concerns the positive feelings that are caused by the actions of Experiential Marketing. According to the results, the consumers who participate in and take part in such events, their feelings on the product are positively influenced. The correlation result is $r = .560$, $p < 0.01$, which means that the correlation is strong and statistically significant. Thus, hypothesis one is accepted.

Figure 2. *Experiential Marketing actions and feelings*

	Pearson Correlation	Sig. (2-tailed)
Experiential Marketing Actions Feelings	.560	$p < 0.01$

According to the second hypothesis, there is an important correlation between Experiential Marketing and perceived value. Observing the below table, we see that the perceived value of the consumer influences consumers' positive view, while $r = .220$, $p < 0.05$. The correlation is weak, but it is statistically significant, which means that hypothesis two is rejected.

Figure 3. *Perceived Value and Positive View*

	Pearson Correlation	Sig. (2-tailed)
Perceived Value Positive View	.220	$p < 0.05$

Continuing with the third hypothesis and as shown in the table below, there is a positive correlation between perceived value and purchase intentions, with $r = .400$, $p < 0.01$. Thus, hypothesis three is accepted.

Figure 4. *Purchase Intention and Perceived Value*

	Pearson Correlation	Sig. (2-tailed)
Perceived Value Positive View	.400	$p < 0.01$

It turned out that the fourth hypothesis is being accepted as the consumer taking part in experiential marketing actions has a positive word of mouth for a product. The correlation is strong and statistically significant, with the results being $r = .420$, $p < 0.05$.

Figure 5. *Perceived Value and Positive View*

	Pearson Correlation	Sig. (2-tailed)
Experiential Actions Positive WOM	.420	$p < 0.05$

To continue with and as can be seen from the last table, it appears that $r = .870$, $p < 0.01$, meaning that a positive Word of Mouth has also a positive influence on loyalty to this product with a very strong correlation.

Figure 6. *Word of Mouth and Loyalty*

	Pearson Correlation	Sig. (2-tailed)
Word of Mouth Loyalty	.870	$p < 0.01$

5 CONCLUSIONS

The analysis of our results has shown that consumers participating in an experiential marketing event have positive feelings, namely positive mood and pleasure from the activity. Nevertheless, we notice that the sense of joy and the surprise of participating in the experiential marketing activity are indifferent to consumers. In this case, we verify Schmitt's theory (1999a) according to which any of the five dimensions of the experience chosen by an advertising / trading company as the main component of a campaign will have a positive effect and impact on the consumer.

Perceived value and faithfulness are rather uninterested (but not negative) for consumers taking part in such events. Observing this neutral attitude of respondents, we find that it is opposite with both Schmitt's theory (1999b) and Addis and Holbrook (2001) research, according to which Experiential

Marketing has a high positive impact on the perceived value that consumer has for a product. From the results of the study it is clear that experiential marketing is particularly useful for increasing the customer's purchasing intention. So, we conclude that there is a positive correlation between perceived value and purchase intentions.

Last but not least, respondents have a positive experience of participating in experiential marketing actions, and our findings confirm the theory of Ferguson et al. (2009), and Gopalan, and Narayan (2010), according to which a positive experience leads to a positive Word of Mouth, which then drives to a loyal behaviour towards a brand.

6 PRACTICAL IMPLICATIONS

Bearing in mind the results from Chapter 4, it can be seen from Table 1 the significance of Experiential Marketing in creating positive feelings. According to Wu et al. (2018), sensory strategies in places influence in a positive way consumers' feeling. Thus, as feelings include a variable most of the companies want to control, is suggested to engage sensory strategies in their plan.

Perceived value is assumed by Schmitt (1999b) and Addis and Holbrook (2001) to be a factor affected by experiential marketing actions and therefore influencing the decision making. However, the correlation shown in Table 2, is opposite to the theory. Companies are encouraged not to use such events with the aim of influencing perceived value. According to (Verhoef et al., 2009), perceived value deals with the human's perceptions of a product, as a result, it is better to use strategies influencing the WOM, a variable directly linked with perceived value. Bearing in mind Table 3 that examines perceived value with purchase intention and their positive correlation, it is shown once again the importance of perceived value and its proper management.

As per the WOM and its strong influence, nowadays most of the companies are engaging actions to enhance the positive wording for their products or services. It is worth mentioning Brown et al. (2007) discussed, people are finding trustworthy. Table 4 shows the significant and positive correlation between experiential marketing and WOM, with the result that companies are strongly proposed to use such sensory strategies. WOM can also increase a company's revenues, therefore a good management with an emphasis on humans' senses is encouraged.

7 LIMITATIONS AND FUTURE RESEARCH

7.1 Limitations

7.1.1 Sampling errors

As mentioned above, the survey was conducted from 26/11/2017 - 22/12/2017, in the major shopping center of Limassol (My Mall Limassol). Probably there are sampling errors originating from the short research period and the sample chosen, which does not allow us to calculate the statistical error. Moreover, the sample is small (302) and focuses mainly on the visitors of the one major shopping center in Athens Limassol, thus we are unable to generalize the results of the survey to the entire population of the country.

7.1.2 Non-response errors

There was a greater response from young people and from students who had completed a postgraduate program for the following reasons:

- a) graduate students and graduates were familiar with their research, process and importance, either because they had previously carried out some research or will in the future.
- b) there were difficulties on approaching people aged 55-64 and 65+, as they were not patient and did not understand the importance of the process for accurate and true completion of the questionnaire.

7.1.3 Errors when collecting data

Some respondents were not able to give complete answers to the questions when completing the questionnaire either because they did not understand the seriousness and importance of the questionnaire or were under time pressure.

In addition, the questionnaire design was done by selecting a closed question type, in order to facilitate the completion and analysis of the results. The result was the standardization of responses and the exclusion of different answers that some respondents might have wanted to give.

7.2 Future Research

The design of the questionnaire was done by selecting a closed type of questions, for the purpose of completing and analysing the results. The result was the standardization of responses and the exclusion of different answers that some respondents might have wanted to give. On a future research, it would be interesting to investigate this topic with in-depth interviews in order to research the insights of the above experiences.

Additionally, it would be interesting to study the future intentions of the participants, which will vary according to the sample and places that will be investigated. The next attractive field of research is to explore the above hypotheses in different countries where they have different cultures and habits. We

would suggest that a random sample (probability sample) could be explored at a wider geographic region.

PERCENTILE CITATION-BASED METHOD FOR SCREENING THE MOST HIGHLY CITED PAPERS IN LONGITUDINAL BIBLIOMETRIC STUDIES AND SYSTEMATIC LITERATURE REVIEWS

Pech, Gerson¹; Delgado, Catarina²

²LIAAD INESC TEC and Faculty of Economics, University of Porto, FEP, Porto, Portugal

ABSTRACT

We studied the problem of how to identify the most impactful papers of a scientific field, for longitudinal bibliometric analyses or systematic literature reviews' purposes. We show that using raw citation counts, the most popular approach, it is not suitable to compare papers from different periods. Other approaches, such as the use of normalized citations by the paper's exposure time, or by the annual average citations of the area, although improving the selection quality, do not lead to sufficiently homogeneous results in terms of citation counts and number of papers published per year. As an alternative, we propose a percentile citation-based method and compare it to the commonly used approaches, for the Top100, and the Top500 in a sample of 25144 papers. This sample was collected from the Scopus database, by selecting the top 10% sources titles in the period 1987-2015 in the Archaeology field. Our results show that the choice of the right normalization metric to be used in the ranking of the impact of the papers is crucial, since it may privilege certain periods, while neglecting others. Based on our results, we argue that this does not happen with our approach, the percentile method.

Keywords: Citation analysis, Percentile method, Most highly cited paper, Longitudinal bibliometric study, Systematic literature review, Citation impact.

INTRODUCTION

In the 21st century, the evolution of the facilities to access citation information in databases, such as Scopus, Web of Science (WoS), and Google Scholar (GS), and the development of bibliometric tools for the systematic analysis of literature, such as VOSviewer, CitNetExplorer (Van Eck and Waltman, 2010, 2017) and CiteSpace (Chen, 2004) led to an abrupt increase in the quantity and richness of the literature review articles (Tomaszewski, 2018). Many of these papers seek to map the evolution of a specific science field, or the progress of a country in a particular research subject, over a long period (sometimes more than 40 years). In these studies, citation analysis plays a key role, because while the number of

publications represents quantitative aspects of a research item (e.g., a country, a journal, a department, an author, etc.), the number of citations provides an indication of quality (Reingewertz and Lutmar, 2018). For instance, citation analysis of the classical or top-cited articles of a scientific field can significantly contribute to this field in terms of exhibiting up-to-date academic information, progress, and tendencies (Dokur and Uysal, 2018). In order for its application produce reliable results, the use of citation counts for comparison of units in research (e.g., researchers, research groups, institutions, or countries) publishing in different disciplines and time periods is only possible with normalized citation scores (Haunschild and Bornmann, 2016).

Indeed, in the past few years a lively debate has taken place about bibliometric indicators, like citation normalization, which focuses on their statistical properties (Moed, 2016). However, despite the wide effort of these researches, it can be verified in the literature that, in many recent papers of systematic literature reviews (Lu and Liu, 2014; Alajmi and Alhaji, 2018, among others), the use of citation counting is performed through non-normalized metrics and, therefore, not efficient in the time comparison. In addition, also in the case where the citation indicators are normalized through specific metrics (e.g., Ahmi et al., 2018; Zamore et al., 2018), it is difficult to ensure that the formula used is not neglecting articles with relevant impact potential.

The selection of papers through the number of absolute (non-standardized) citations is not sufficient to take into account for more recent papers that already show great impact. Selecting papers through a TopN set (often, with $N = 100$) does not balance the impact of published articles in different periods. Different ways of dealing with citations lead to different rankings, and according to the criteria established by these methods one may be privileging older papers in some cases, or more recent ones in others, making the analysis incomplete.

In this paper, we investigate two questions. Firstly, which are the main citation metrics that are able to select articles in a weighted way for the systematic literature reviews, and how do they compare with the percentile-based approach? Secondly, what are the consequences of using percentile rank (with the year of publication as a tie-breaking rule) to select highly cited papers to be used in literature reviews? For the first purpose, we investigated how citation metrics used recently in longitudinal literature reviews are calculated, and the divergences that arise when the papers of a specific research field are ranked according to each of the criteria established by these metrics. For the second purpose, we analyzed the main characteristics of the annual number of articles belonging to the Top100 and Top500 of each metric rank. We use the Top100 because it is used by several longitudinal studies (e.g., Dokur and Uysal, 2018, Yeung, Heinrich and Atanasov, 2018), and the Top500 for comparison purposes, and to understand what happens when the selection list is expanded. The main particularities of the behavior of the rank metrics when we switch from Top100 to Top500, practically, remain unchanged.

To understand the differences among the ranks over the years we have also calculated the annual averages obtained by each metric. The relationship between the temporal evolution of the total number of papers and the corresponding number of papers obtained by the Top100 and Top500 of each metric served to clarify important issues of our second purpose. In this way, we can have a clear view of which periods are privileged when using one metric or another, and which periods are neglected.

In this study we used Scopus database from Archaeology field, 25.144 papers, that was built with the top 10% sources titles for the period 1987-2015. Our findings, although the research is exploratory and limited to the analyzed database, show that the percentile-based approach should be preferred for calculating normalized citation impact values, because it takes into account, in a balanced way, the various temporal periods that are usually investigated in longitudinal studies.

BACKGROUND

In order to develop this background, we perform a search using the terms: "citation analysis" OR "citation count" AND "database" OR "Scopus" OR "Web of science" OR "WoS" OR "Google Scholar" OR "GS". The survey was conducted on Scopus and WoS databases on TITLE-ABS-KEY with a limit of years 2017 and 2018. Several abstracts of articles that involve longitudinal reviews over a period larger than 15 years were analyzed to understand if one of the key points of the study is related to the citation counts. After that, all papers whose abstracts were aligned with this criterion were studied in order to capture which citation-based indicators were used to compare and prioritize articles, authors, countries, departments, institutes, research groups, etc.

The following list describes the citation-based indicators (C_x) founded in this study. Although field- and time-normalization of metrics is currently a standard procedure among bibliometricians (Leydesdorff, Wouters and Bornmann, 2016), most of the citation indicators are still based on simple non-normalized averages (e.g., C1, C2 and C3).

(a) Normalized citation impact value (C1):

$$C1 = \frac{\langle Ci \rangle_{Country}}{\langle Ci \rangle_{All}} \quad (1)$$

where, $\langle Ci \rangle_{Country}$ is the mean citation rate to a country's set of publications, and $\langle Ci \rangle_{all}$ is the mean of citation of all publications in that subject area. $C1 = 1$, for a specific country in a specific subject area indicates that the citation impact of papers published by scientists in this country is no more and no less than the average impact of papers in this subject area (Bornmann and Leydesdorff, 2013). Note that the idea applied for this country mean citation is the same as used in SNIP – source normalized impact

per paper indicator (Moed, 2016). However, in the case of SNIP, the indicator is relative to a journal performance over all other journals in the field.

(b) Average number of citations (C2):

$$C2 = \frac{\sum_{i=1}^N C_i}{N} \quad (2)$$

where, C_i is the citation count of a paper i and N is the sample quantity. The average number of citations (C2) is also called mean citation per paper or citations per publication. The sample can be the papers of a country, an author, an institution or another item over valuation. In fact, C2 represents nothing more than the arithmetic mean of citations.

(c) Citation rate per year (C3):

$$C3 = \frac{12 C_i}{M} \quad (3)$$

where, M is the number of months since de initial publication up to the month of extraction. The citation rate per year (C3) is also called citation count per year since publication, or adjusted citation index. This citation rate per year can be viewed as the average number of citations that paper has received each year since it was published (Wilcox et al., 2013). Thus, this metric has the advantage to adjust citations for the "exposure time" of articles published.

(d) Scaled citation count (C4):

$$C4 = \frac{C_i}{\langle C_i \rangle_{year}} \quad (4)$$

where $\langle C_i \rangle_{year}$ is the average citation count in the same year as the publication of paper i . Thus, C4 is a normalized indicator that shows the discrepancy between C_i and the mean citations of other papers that were published in the same year of paper i . As in the case of C1 (Eq. 1), a value of 1 for a specific paper indicates that the citation impact of this paper is no more and no less than the average impact of papers, in this scientific field, published in the same year.

(e) Citation density (C5):

$$C5 = \frac{\langle C_i \rangle_{year}}{Y} \quad (5)$$

where, Y is the number of years since de initial publication up to the year of extraction. For example, if a study was done in 2015, and we found 25 papers with total citation count equal to 1500 ($\sum C_i = 1500$) published in the year 2000, the citation density (C5), i.e. the citations per paper per citation year is $(1500/25/16) = 3.75$. So, C5 combines C2 with C3 to provide a normalized citation-based indicator witch

measures citation impact in terms of both: (i) citations per paper, and (ii) citations per citation year (Ahmed et al., 2017).

Table 1. *Reviews using citation analysis*

Table 1 introduces a sample of 16 scientific articles that were analysed, in terms of the citations screening method used. Because of the space limitation, we only show the articles from the last 2 years (2017 and 2018). For each article we showed the database used in the search; the first and last year used in the review study; the interval of years of the longitudinal analysis corresponding to the study (Δt); the scientific field of the investigation or the journals in which the research was carried out; if a set of specific countries was used or if there was no such limitation; and finally, what was the metric used in the citation analysis. C0 corresponds to the situation that only the raw citation data were used, and the value of n means that extraction was based on the n more cited articles (top n cited).

As can be seen from Table 1, only one of the review articles uses a normalized metric C4. It is the article by Reingewertz and Lutmar (2018) that explore the possibility of bias in publication processes. They used citation counts as a proxy measure for article quality. For them, the assumption that citations reflect quality is crucial. To control for variation across time, the citation counts are divided by the average citation count in the same year (Reingewertz and Lutmar, 2018). C2 was used in 7 articles and is the most common. However, this metric, like C0, does not represent normalization. It's just an average of some documents. Normalization by C3 is used in 4 investigations (Table 1). This metric is easy to use and takes into account, in a simple way, the number of years of exposure of a paper. It was used in the work of Ahmi et al. (2018) to draw the trends of the e-SCM using bibliometric analysis and in the study of Zamore et al. (2018) to provide a comprehensive review of scholarly research on credit risk measurement. In others 2 work this metric was used for the top 100 papers of the field: First, Yeung, Heinrich and Atanasov (2018) calculated C3 for the 100 most cited paper in Ethnopharmacology and showed that citation counts of the articles have no significant correlation with the number of years since publication; second, to perform a comparative bibliometric analysis of the Top 100 most cited articles in the field of PCa, Adam et al. (2017) recalculated the citations using C3 and showed that this resulted in a drastic change of the overall ranking, with, for example, the previously seventh ranked most cited paper, ranking highest.

DATA

In order to provide some numerical examples, we collected the data from Scopus from the subject area: Archaeology in Arts and Humanities (25144 papers in the Scopus database). The database was built

with the top 10% sources titles, in terms of citations, from 1987 to 2015. Data were obtained from the file *CiteScore_Metrics_2011-2017* downloaded on Scopus.com on May 25, 2018, using the following 2 filters: in the column Scopus Sub-Subject Area we selected Archaeology, and in the column Top 10% (CiteScore Percentile) we selected Top 10%. The search of the articles and their corresponding citation numbers was conducted between August and September 2018 on Scopus site. For this, we used the Print-ISSN and e-ISSN codes of each journal, instead of the title name, to avoid collection errors. We collected the results for the period 1987-2015. On the Scopus website, we used the link View Citation Overview. The citation overview is available as a comma separated file (.csv) with the first 20,000 documents included, that we downloaded separately for each year of the interval.

METHOD

With the annual list of citation data for each article we calculate the metrics $C3$ and $C4$ which are the normalization metrics that can be associated with individual articles. Note that these metrics are directly related to the list of publications for each year. The metrics $C1$, $C2$, and $C5$ are calculated parameters for certain sets of papers (e.g., countries, universities, authors, etc) and, therefore, they were not used to provide results for this study. In addition to $C3$ and $C4$, we also calculated the percentile associated with each paper within its year of publication. The percentile rank approach has the advantage that, intrinsically, implies the normalization of citation counting data (Brito and Rodríguez-Navarro, 2018). We defined $C6$ as the percentile metric. In the percentile formula applied in this study, we used the value equal to 0 for papers that have no citation counts. In fact, by assigning the zero classification to articles with zero citations, one can guarantee that the absence of impact of these works is reflected in the same way in all the sets of papers studied (Bornmann, Leydesdorff and Wang, 2013). An analogous concept can be applied to the paper with the highest number of citations in each year. Therefore, for these papers we used $C6 = 1$. In the percentile formula used in this study, if a paper has $C6 = x$, it means that there are $x\%$ of papers with fewer citations than this paper. This means that in a sample of 3000 papers, if 60 papers did not obtain citations, papers that have 1 citation ($C0 = 1$) will have $C6 = 0.02$.

After setting the $C3$, $C4$, $C6$ values and, also with $C0$, we constructed the list with 25144 papers published in the period 1987-2015. Thus, they were placed in descending order 4 times, and we build the $C0$, $C3$, $C4$ and $C6$ ranks. The tiebreakers were resolved using the publication year, with the most recent paper being ranked first.

RESULTS AND DISCUSSIONS

Table 2 reveals what happens when we use a list of the first 20 papers of each of the four ranks studied. The first column presents the Top20 of all sample articles when the ranking is performed by C0 values. The other numbers between "semicolon" are the classifications of each of these articles in the other three ranks. Thus, the article with the highest number of citations ($C_0 = 1$) is in 4th order in C3 rank and 2nd in C4 rank, but in C6 its placement is well below. This is due to the way in which each metric calculates its values and, also, by the tiebreak rule used. From this table it is possible to verify the divergence between the metrics that usually have been used to select the works of greater impact in several research fields.

[C0]; C3; C4; C6 rank	C0; [C3]; C4; C6 rank	C0; C3; [C4]; C6 rank	C0; C3; C4; [C6] rank

Table 2. List of the first 20 articles of the Cx rank and their orders in the other rankings. [Cx] defines the ranking performed. The first column reproduces the classification obtained by C0 rank (larger and in bold), and the other numbers between "semicolon" the position from the same article in the other rankings. On the second column, the same but with C3 (larger and in bold), and so on.

Figure 1. Annual distribution of Top100 and Top500 papers. The evolution of the number of papers across the period 1987-2015 for C0, C3, C4 and C6 ranks for papers belonging to Top100 (A and B); and to Top500 (C and D). The number inside the bar express the number of papers belonging to Top100 (B) and to Top500 (D) of each metric rank.

Figure 1 shows the annual distribution of the number of papers in the sample when using each of the four citations metrics. (A) and (B) represent the distribution for Top100 articles, and (C) and (D) the Top500. The Top100 distribution behavior resembles Top500. In both, C0 decreases over time, as newer papers have not yet been able to have their impact in terms of citations, and thus take a lot of disadvantage when using this metric. It is important to note that this is already observed as of 2007 for the Top 500. On the other hand, the use of C3 disadvantages of older papers. In fact, when dividing the number of citations by the exposure years, the older articles get C3 values relatively low. This is aggravated in case of a broad longitudinal analysis in which the authors are studying about 50 research years, or more. C4 is the most oscillating, alternating high and low values, year by year, which is not compatible with a parameter that seeks to match a normalized expected value. Of all the metrics studied, the C6 is the one that generates the smoother annual distribution, that is, without the oscillations of the other normalization criteria presented. Also, even with the latest articles being benefited because of the tiebreaker rule used, older papers take part proportionately well of the annual distribution when C6 is used.

Figure 2. Annual averages for different citation metrics. The logarithmic scale on the y-axis facilitates the visualization of the 4 curves together

Figure 2 shows the average of C_x per year ($\langle C_x \rangle$). As can be seen from this figure, both the percentile approach and $\langle C_4 \rangle$ present annual invariant values. This aspect, expected in view of its formulas, corresponds to giving equal weights to each of the years for the number of articles that will be selected by a specific method (for example, Top100). On the other hand, $\langle C_3 \rangle$ and $\langle C_0 \rangle$ oscillate over time. The case of $\langle C_3 \rangle$ is interesting and its aspects should be taken into account when this metric will be used to evaluate the impact of papers. Its value increases during the 90's, but then the curve gets smoother to start a drop in the last two years of our analysis. Indeed, for this metric the exposure time participates in the result of the average through two factors: in the denominator, that, year by year increases the average; and in the numerator itself that, year by year decreases the average, because of the lower citation counts. $\langle C_0 \rangle$ vary around, approximately, 45 up to the year 2002 and, thereafter declines since more recent articles have lower citation counts than the older ones.

Figure 3 compares the behavior over the years of the total number of papers published with the number of papers selected by the Top100 (A, C, E and G), and Top 500 (B, D, F and H) for each of the 4 metrics studied in this article. It can be noticed that the selection of papers by the C_6 follows the behavior of the curve of the total number of papers. This aspect shows that if this metric is used, we will be considering that the participation of one paper in the ranking is strongly correlated by the total number of papers. This shows that the percentile method positively correlates the likelihood of an article being ranked with the total number of articles that year. This behavior is in part followed by some aspects of the C_3 curve, although this curve neglects older works and fluctuates a lot, year after year. For years prior to 2007/2008, the C_4 curve also produces this weighting, but after that period, it describes oscillatory aspects that are far from the expected one. C_0 , which is the metric without normalization, is the one that less corresponds to this balance.

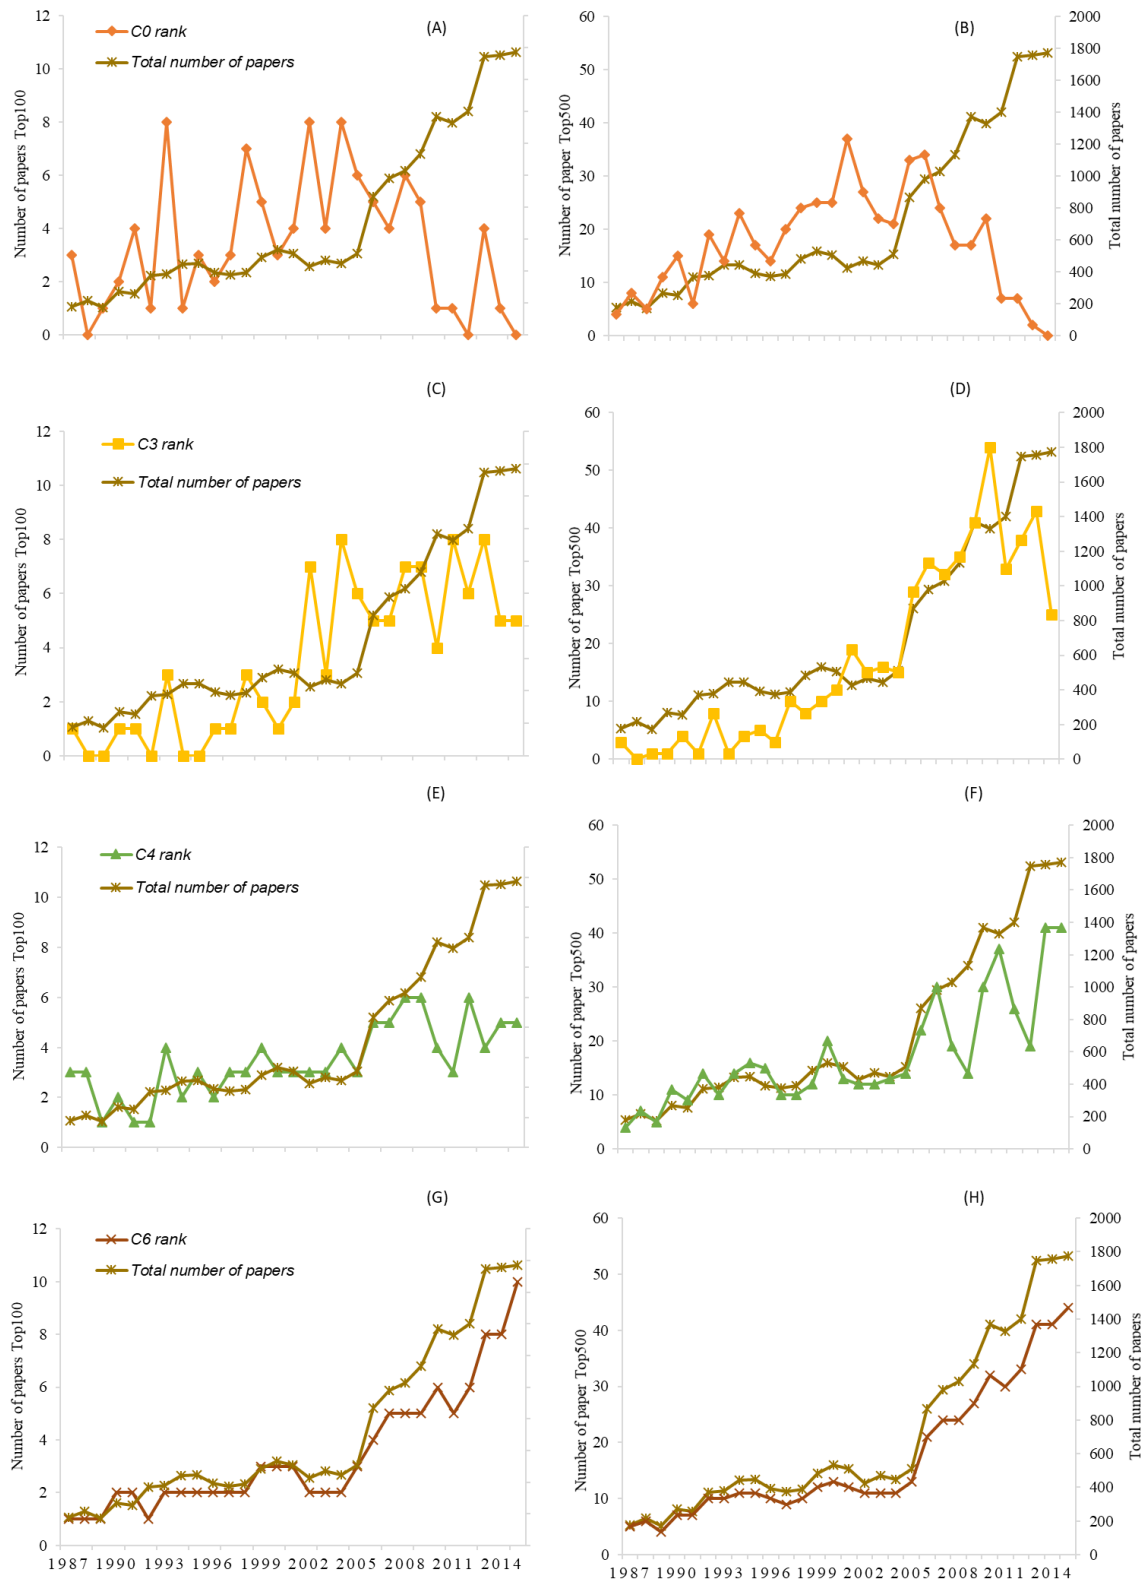

Figure 3. Comparison between the distribution of papers belonging to the rankings of each metric with the total distribution of papers. (A) Top100 C0 rank; (B) Top500 C0 rank; (C) Top100 C3 rank; (D) Top500 C3 rank; (E) Top100 C4 rank; (F) Top500 C4 rank; (G) Top100 C6 rank; (H) Top500 C6 rank. All graphics include the period 1987-2015. The right axis represents the total annual distribution of articles published.

CONCLUSIONS

In this work we analyzed the effectiveness of the most common used citation metrics in longitudinal bibliometric studies, in terms of their ability to select, in a balanced way, highly impact articles from different time periods. One of the metrics used is the number of citations without any normalization, while the other three metrics are obtained through normalizations – one by the annual mean of citations, another by the number of years of exposure, and the other by the percentiles. Our results show that, of all the metrics presented, the percentile approach is best suited to provide appropriate weights for the citations either of the oldest or the most recent articles. This work is an exploratory and preliminary study based on the analysis of a 25000 sample of papers of a specific scientific area. For more conclusive studies the analysis suggested in this paper needs to be applied to other areas of research. Our percentile-rank approach may improve the work of researchers who develop structured literature reviews and longitudinal scientometric studies, since they may more effectively select the most important papers in the research field to be studied.

SMART SUSTAINABLE CITY AND URBAN KNOWLEDGE-BASED ECONOMY: EVIDENCES FROM ITALY

Penco, Lara¹; Ivaldi, Enrico²; Isola, Gabriele¹; Musso, Enrico¹

¹Department of Economics and Business Studies, University of Genoa

²Department of Political Science, University of Genoa

ABSTRACT

The present paper aims to answer the following research questions: i) is the smart and sustainable city environment a stimulus for the urban knowledge-based economy? ii) which profiles of smart and sustainable city are more conducive to stimulate the urban knowledge-based economy? In order to answer to the aforementioned research questions, this study develops a framework and multidimensional indexes to better explain the different dimensions of a 'smart sustainable city' and their impact on the knowledge-based economy. The analysis was performed on a sample of 116 Italian cities. Italy is an interesting context, while large cities (that present hard and soft infrastructures) and smaller cities (in which the quality of life tend to be higher) coexist. Our study makes a significant contribution to the literature because it provides a new approach to understanding the factors influencing a smart city and identifies profiles that are important in the development of the economic growth at urban-level, providing implications for academics and urban policy makers.

Keywords: smart city; sustainable city; knowledge-based economy, knowledge workers, statistical index

INTRODUCTION

The concept of smart cities has attracted significant attention within the public policies and in the academic literature focused on urban development. Nevertheless it is not possible to identify a unique and generalized definition, it is commonly recognized that the concept of smart city is referred to the creation of a network of human capital, social capital, and information and communications technologies (ICTs), supported by hard and soft infrastructures (Hollands, 2008). Recently, literature has started to considerate the concept of Smart Sustainable Cities in order to include the different aspects of sustainability in the classical "smart cities" paradigm. A Smart Sustainable City is a place where the environmental and the quality of life profiles are at the centre of the attention. So, what creates a city "smart" and "sustainable" is the attitude of policies to optimize the functionality of the city in all sectors, by protecting the environment, by stimulating economic growth in the local context,

and by improving the quality of life of people, thanks to infrastructures, processes and services helped by ICTs.

The Smart Sustainable City approach is considered suitable for representing the most important features of “quality of life” (Pinna et al., 2017) that can help to attract and retain talents and knowledge workers in urban areas to form analytical, synthetic, and symbolic knowledge based economy (Florida, 2002). Moreover, literature on SSCs regards also cases of small and medium cities, where the attention to citizens’ quality of life is increasing (Ibrahim et al., 2018).

In fact, the extant economic literature on knowledge-based economy is mainly referred to large metropolises: moreover, the main studies tend to focus on North American or emerging economy cities (Glaeser et al. 2010, 2014; Florida 2002; Florida et al. 2008), while only a few academic contributions are addressing knowledge-based economy and their development drivers in urban ecosystem different from metropolises.

In this vein, the present paper focuses on the role of urban environment in promoting knowledge-based economy following the “Smart Sustainable City” perspective.

It is commonly recognized that in knowledge economy cities are characterized by a growing proportion of knowledge workers and by the service-orientation of the economic activities (Sassen, 1994; Hendriks, 1999; Madon and Sahay 2001; Turok 2008; Glaser et al. 2010; 2014). At EU level, Lever (2002) has found a positive correlation between economic development and knowledge “attitude” in European cities. From this perspective, urban policies and governance should be oriented to nurture a strong “people climate”. Knight (1995; 2008), Perry (2008) and the Yigitcanlar (2011) have defined the concept of Knowledge Based Urban Development. The goal is to construct a knowledge city (Carrillo et al., 2014) that is a city which is focused on knowledge-based development (Carrillo et al., 2014; Penco, 2015; Edvardsson et al., 2016).

In the literature on urban development, the relationship between the paradigms characterizing the smart and sustainable city and their effects on the urban knowledge-based economy (in terms of knowledge workers and economic activities) does not explicitly emerge.

In light of these considerations, the present contribution aims to answer the following research questions: i) is the smart and sustainable city environment a stimulus for the urban knowledge-based economy? ii) which profiles of smart and sustainable city are more conducive to stimulate the urban knowledge-based economy? The research is carried out on a sample including 116 Italian cities. The presence of small and big cities is important to foster both their smart and sustainable features and different knowledge economy attitude.

The case of Italy is very interesting since their urban development is very differentiated (from big and smaller cities; from northern and southern cities). Smart Sustainable policies are also suitable for small

sized cities, where 19% of the Italian population is concentrated: in fact, smart sustainable policies are aimed at the implementation of smart transportation, the reduction of population isolation, the response to the new and growing needs of the “grey” population, the promotion of ecological environment and sustainable tourism that can differentiate small cities from the most famous cities in order to retain and attract “young” and “knowledge based” talents. In this vein, the adoption of smart and sustainable policies can help the small urban ecosystem in order to increase the range and efficiency of their services (and the consequent improvement in quality of life), but also the whole economic system can benefit from the knowledge based development of smart communities.

The paper is organized as follows. Section 2 reviews extant literature on knowledge economy and smart and sustainable cities. Section 3 explains the research design and method, describing the construction of the indicators and shows the major empirical findings. Section 4 discusses the outcomes, bringing implications for academics and practitioners, before concluding.

LITERATURE REVIEW: CITY, KNOWLEDGE-BASED ECONOMY AND SMART SUSTAINABLE CITIES

City and Knowledge-based economy

Knowledge Management studies have emphasized the city’s role in the production of knowledge. The model of the industrial city is, in fact, disappearing, because firms specifically locate operational and manufacturing activities where a comparative advantage of cost can be found; support activities, based on knowledge, are established in geographical spaces that facilitate knowledge-based production. In this vein, the process of deindustrialization is often seen as part of the inevitable shift towards a knowledge based economy and urban economies come to rely on research and development, financial services, tourism and the creative industries (Van Winden and Van den Berg 2004; 2010).

In the knowledge economy, the most successful cities operate as knowledge-hubs (Hendriks, 1999; Marmolejo, 2007; Evers et al., 2010). Studies carried out on corporate localization have recognized that knowledge-based firms - high tech companies, Knowledge Intensive Business Services (KIBS), Corporate Headquarters of multinational companies or service-based subsidiaries of large companies (eg. R&D, design, marketing, etc.) select metropolitan areas (Gabe 2011). Nascent and creative industries, such as digital media, publishing, and music companies could also be included in this category.

The appeal of large metropolitan areas for knowledge-based companies are linked to agglomeration economies. Urban agglomeration economies differ from marshallian economies in industrial districts (Beaudry and Schiffauerova, 2009). Urban agglomeration economies are “knowledge agglomerations”:

they produce synergies due to the closed transmission of knowledge between: i) knowledge-intensive firms; ii) areas such as higher education, research and development (universities); iii) complementary knowledge intensive business services; financial intermediation, national and international public institutions and telecommunication networks that are placed in large metropolitan areas. In general, the bigger the city, the better the access firms may have to a deep labour pool, a large customer base, choice of shared services and suppliers, and transportation connections (Turok 2008). Proximity facilitates face to face contact, high level communication and sharing of new ideas (Isaksen 2004; Krugman 1998).

Literature has considered that the development of a urban knowledge-based economy is based on the ability to attract new talents. Talents are represented by knowledge-workers and they form the "creative class" (Florida 2002). The creative class – for example engineers, scientists, architects, and artists – generates the ideas and knowledge that are the driving force in both advanced manufacturing and knowledge-intensive service economies (Castells, 1996). Florida (2002) has argued that the development of a region or of a city is driven by the location choices of the creative class; the creative class prefers "different places, tolerant and open to new ideas," according to the model of the three Ts (Technology-Talents- Tolerance). The geography of the creative class is indeed influenced not only by hard economic factors (e.g. wages, taxes, living costs), but also by lifestyle and environmental contexts; knowledge workers, that are generally employed (or self-employed) in knowledge-based businesses, live where they can find a highly regarded quality of life. International studies, carried out on location choices of high-tech companies that employ knowledge workers (Malecky and Bradbury 1992), showed that the presence of amenities and quality of life are a very critical factor. The amenities activate a virtuous circle, as "talent attracts talents, shaping a density of clusters" (Edvinsson 2006). Studies have elaborated the question of attracting and retaining knowledge and creative workers in the knowledge economy by addressing the needs and desires of knowledge workers in the contemporary urban context (Yigitcanlar et al. 2007). The creative class expresses a specific demand for the city.

Contributions on the creative class in the USA and Europe by Florida have found that the social environments is important for the creative economy and there is an association between the size of a creative class and the size of the knowledge economy (Florida, 2002; 2008). Larger cities have a great advantage: the knowledge and creative workers are attracted by a context that stimulates creativity and inventiveness, with high quality of life due to the advanced services and amenities located in the metropolitan area. In contrast to Marshallian economies in industrial districts, urban agglomeration economies are "knowledge agglomerations" (Penco, 2015). Cities provide amenities and infrastructures that are attractive to its high human capital residents (Florida, 2002; 2008). Physical

conditions and amenities increase social life and a perceived improvement in quality of life (Glaeser and Gottlieb, 2006; Warnaby and Davies 1997; McKee and McKee 2004; Benninson et al. 2007; Turok 2008).

Nelson (2005) and Ström, P., & Nelson, R. (2010), challenging the creative class thesis, has found that many smaller urban centres in North America and in Sweden have experienced sustained growth in their creative labour force over the past 20–30 years; in particular, college towns and (post-industrial) small town that prioritize quality of life. Piccaluga and Lazzeroni (2015) and Adendorff and Donaldson (2012) have focused their studies on medium-sized university cities, in which the presence of one or more universities represents an important asset for urban development, contributing to the identity of knowledge cities. Waitt and Gibson (2009), using empirical materials from a case study of one Australian city—Wollongong, in New South Wale, have argued that the regeneration of economy towards knowledge based and creative factors is possible also in smaller cities where the citizen's quality of life tend to be higher.

Smart sustainable cities: can they attract knowledge workers and stimulate knowledge-based economy?

After the introduction of the “smart city” concept in 1994, the number of academic contributions regarding this topic has significantly increased (Jucevicius, Patašienė, & Patašius, 2014; Cocchia, 2014). Considering the interdisciplinary of this concept, many definitions of smart cities has been raised. From the technological perspective, a smart city is a city with a great presence of ICT applied to critical infrastructure components and services (Washburn et al., 2010). Nam and Pardo (2011) have tried to enlarge the scope of the concept of smart cities, defining a wider range of core factors, such as technology, people (creativity, diversity, and education) and institutions (governance and policy). Several recent definitions have a secondary focus: the concept of smart city tend to be connected to the definition of ICT in promoting sustainability, economic development, and the citizen's quality of life (Giffinger et al., 2007). Many researchers have argued that quality of life may not represent a separate dimension of a smart city, since all the policies should have the objective of raising the quality of life (Shapiro, 2006).

With a specific focus on the knowledge-based economy, Thite (2011) has studied smart city experiments around the world that are aimed at nurturing a creative economy through investment in quality of life which in turn attracts knowledge workers to live and work in smart cities.

In order to explicitly enlarge the scope of smart city towards the sustainable urban environment, scholars have started to consider the term “Smart Sustainable Cities”, focusing on the different aspects of sustainability in the classical “smart cities” paradigm (Höjer and Wangel, 2015): sustainable city is a place that have a strong environmental focus with a balance within the city between infrastructures, ICT, smart technologies, and urban metabolism, e.g. sewage, water, energy, waste management

(Marans and Stimson, 2011). A Smart Sustainable City is a city “that meets the needs of its present inhabitants, without compromising the ability for other people or future generations to meet their needs, and thus, does not exceed local or planetary environmental limitations, and where this is supported by ICT” (Höjer and Wangel, 2015). A smart sustainable city is oriented to enhance the quality of life to its citizens, improving efficiency of services and sustainable urban development. Contributions in the smart sustainable city domain have tried to evaluate citizens’ urban life quality by interpreting interactions between urban and environmental systems, and between critical resources and their influences on the environment (Garau, and Pavan, 2018). It is very interesting that the concept of smart sustainable city is effectively applicable also to smaller city (Garau and Pavan, 2018) in order to create a more attractive environment for their citizens.

Therefore, it could be hypothesised that a more attractive urban environment help to retain and attract knowledge workers and to stimulate knowledge-based activities that are a driver of economic development; nevertheless, within the literature on paradigms of the smart sustainable city the impacts on the creation of knowledge-based economy at the urban level doesn’t explicitly emerge.

On the basis of the aforementioned premises and literature gap in this relationship, our work follows the Smart Sustainable City approach and the knowledge economy with a particular focus on the capacity of a Smart Sustainable City to attract and nurture knowledge people and knowledge based economy; in particular, our work tries to understand if and how a smart and sustainable urban environment aimed at increasing the citizens’ quality of life is able to retain and nurture knowledge workers and economy, according to Thite (2011). Moreover, we analyse also the role of the urban size. In order to meet the goals of the paper, firstly we create 4 domains of Smart Sustainable City “quality of life oriented”.

Secondly, we identify another index for measuring the knowledge based economic activity at city level (focused mainly on the role of knowledge worker and innovation). Thirdly, we explain the relationship among each dimension of Smart Sustainable City and knowledge based economic activity, trying to identify any bottlenecks and policy implications.

METHODOLOGY

The sample includes 116 Italian Cities, the provincial capital cities and metropolitan cities of Italy in order to be able to carry out an adequately punctual and widespread analysis on the national territory. Each City has been evaluated in terms of size, following this criteria: small urban areas (from 10,000 to 50,000 inhabitants) medium-sized cities (between 50,000 and 250,000 inhabitants) large conurbations (more than 250,000 inhabitants).

We decided to create an innovative multidimensional index (SSC- Smart Sustainable City) in order to better explain the different dimensions of “Smart Sustainable City” following a consolidated methodology (Nardo et al. 2005; Ivaldi et al. 2016a; Ivaldi et al. 2016b), which defines different stages in order to develop a composite indicator.

The selected dimensions (that are converted in sub-indexes) really cover the multidimensional nature of “smart sustainable city” and they present a focus on the citizens’ quality of life that can help to retain and attract knowledge workers: Sustainable Urban Environment (SUE); Sustainable Social Services (SSS); Sustainable Local Transport (SLE); Sustainable Safe Environment (SSE).

They are sufficiently different, fully describing the multidimensionality of these features and thus the risk of self-correlation is avoided.

The index Knowledge Economy Innovation KEI has been developed in order to explain better the Knowledge-based attitude of each city.

We have considered appropriate to construct an index and sub indexes based on currently available data, which does not require ad hoc surveys, with the double benefit of avoiding additional costs and also being able to easily and regularly update it (Ivaldi et al. 2018). The analysis of the literature offers several ways to derive *a priori* which should be the most suitable variable to insert the index, even if the choice is conditioned, of course, both by the availability of data and the purpose of the index itself (Ivaldi et al. 2017; Landi et al. 2017). The indexes are based on currently available data, coming directly from the Italian Institution for Statistics - ISTAT and referring to the last year of Census 2011 (unless otherwise indicated).

The variables containing excess values, i.e. the values located well outside the limit of the box plot, have been treated so that the largest / smallest value was transformed to have the maximum value equal to the maximum tolerable value, i.e. the largest even to the sum of the third quartile and the product between the double of the constant and the difference between the third and first quartile (and similarly the smallest). By excess value we mean in fact those values of x for which one of the following conditions occurs:

$$x < Q3 + 2\lambda (Q1 - Q3)$$

$$x < Q1 - 2\lambda (Q1 - Q3)$$

Where $Q1$ represents the first quartile, $Q3$ the third quartile and λ the constant lamda.

The value of λ normally is equal to 1.5 but, to allow a greater veracity of the index, given the great variety of the values of each single variable, a weight of two has been assigned.

About 99% of the data was complete and missing data were completed by replacing the missing values with the average of the other variables present in the same area for that particular city, so that

for these cities the scores of the thematic indicators became the same that they would have had if the variables missing were completely excluded (Bannerjee et al 2016).

Data collection was carried out in 116 Italian cities, the provincial capital cities and metropolitan cities of Italy. We have created a composite indicator, grouping the 24 elementary indicators into 4 macro-areas (Table 1).

We carried out the study using The Pena Distance Index (DP2), a parametric index based on the application of the linear regression model (Pena 1977). The DP2 method is an iterative procedure that weighs partial indicators depending on their correlation with the global index. This construction solves a large number of problems, for instance, aggregating variables expressed in different units of measurement, arbitrary weights, the treatment of missing values and duplicate information; (Somarriba and Pena 2009; Montero et al. 2010). Moreover, this method is considered more robust than traditional methods such as Principal Component Analysis and Data Envelopment Analysis, as demonstrated by Somarriba and Pena (2009).

Dimensions	Variables										
Sustainable Urban Environment (SUE)	Urban green areas (2013)	Urban green availability	Urban gardens (2013)	Historic green density and urban parks (2012)	Historic urban fabric (2001)	Mutual air quality *	Mutual noise pollution * (2012)	Separate collection °	Waste sent to landfill * °	Cyclapse density	Availability of pedestrian areas
Sustainable Social Services (SSS)	Primary school and junior high school with accessible routes both internal and external ° (2013)	Number of public libraries (2012)	Children from 0 to 2 years who have used childcare services °	Life expectancy at 0 years °	Graduates ° (2017)						
Sustainable Local Transport (SLT)	Local Public Transport	Services supporting sustainable mobility and infomobility (2012)	Time dedicated to mobility *	Vehicle storage area reserved *							
Sustainable Safe Environment (SSE)	Rate of homicides reported by the police to the judicial authority * °	Rate of traffic accidents * °	Mortality rate of pedestrians *	Standardized rate of mortality for transport accidents for persons aged 15 to 34 years * °							

1. * Inverted variables

2. ° By province

Table 1 – Dimensions and variables used (Source: Our elaboration)

The basis of the synthetic indicator is a mathematical function expressed as $I = F(x_1, x_2, \dots, x_n)$, where I is the synthetic indicator and n the number of variables, x , that contribute information to our index. Starting from a matrix X of order (j, i) , where j – the rows – is the number of the areas considered in this paper and i – the columns – is the number of variables considered. Each element x_{ij} of this matrix represents the state of the variable i in area j . The DP2 indicator, providing the distance of each cities from a reference base, which corresponds to the theoretical area achieving the lowest value of the variables being studied, is defined for area j as follows:

$$DP2_j = \sum_{i=1}^n \left\{ \left(\frac{d_{ij}}{\sigma_i} \right) (1 - R_{i,i-1,i-2,\dots,1}^2) \right\},$$

where

- $i = 1, \dots, n$; (areas) and $j = 1, 2, \dots, m$ (variables);
- $d_{ij} = \left| x_{ij} - x_{ij}^* \right|$ is the difference between the value taken by the i -th variable in area j and the minimum of the variable in the least desirable theoretical scenario, namely the reference value of matrix X ;
- σ_i is the standard deviation of variable i .

Note that the quantity $\frac{d_{ij}}{\sigma_j}$ is merely a change in the origin and the scale, and one may also use zero as the reference ρ point and $[\max_i(x_{ij}) - \min_i(x_{ij})]$ (13) instead σ_j as a scaling factor without any adverse effect on the formula (Montero et al., 2010).

$R_{i,i-1,i-2,\dots,1}^2$ is the coefficient of multiple linear correlation squared in the linear regression of X_i over $X_{i-1}, X_{i-2}, \dots, X_1$, and indicates the part of the variance of X_i explained linearly by variables $X_{i-1}, X_{i-2}, \dots, X_1$. This coefficient is an abstract number and is unrelated to the measurement units of the different variables.

$(1 - R_{i,i-1,i-2,\dots,1}^2)$ is the correction factor, which shows the variance part of X_i not explained by the linear regression model. This factor ensures that the composite synthetic indicator includes only the new information from each variable, avoiding the duplication of information already contained in the preceding variables.

Therefore, $(1 - R_{j,j-1,\dots,1}^2) \cdot R_{j,j-1,\dots,1}^2$ with $j > 1$ is the coefficient of multiple linear correlation squared in the linear regression of the first chosen j over the successive other indicators, included one by one. The first variable obtains an absolute weight of unity $(1 - R_1^2)$, the subsequent variable $j = 2$ obtains a weight $(1 - R_{2,1}^2)$, the third $j = 3$ $(1 - R_{3,2,1}^2)$, and in general, the j -th variable obtains a weight $(1 - R_{j,j-1,\dots,1}^2)$. The chosen j is regressed over other indicators included one by one. The resulting $R_{j,j-1,\dots,1}^2$ for any j is used a weight. In this way, the weight assigned to each indicator follow a precise rule that has the goal to reduce the duplicity of information that often affect aggregation methods (Somarriba and Peña, 2009; Montero et al., 2010; Ivaldi et al. 2018).

The first variable obtains an absolute weight of $(1 - R_1^2)$. The subsequent variable $j = 2$ obtains a weight $(1 - R_{2,1}^2)$. In general, the j -th variable obtains a weight $(1 - R_{j,j-1,\dots,1}^2)$:

1. Initialize the weight vector, $w_j = 1 \forall j = 1, 2, \dots, m$ and define $\varepsilon = 0.00001$.
2. Define $\partial_{ij} = \left(\frac{d_{ij}}{\sigma_j}\right)$, $\forall j = 1, 2, \dots, m$ and $i = 1, 2, \dots, n$.
3. Obtain $DF_i = \sum_{j=1}^m \left[\left(\frac{d_{ij}}{\sigma_j}\right) w_j\right]$; $i = 1, 2, \dots, n$.
4. Compute Pearson's coefficient of correlation $r(DF, \partial_j)$ between DF and $\partial_j \forall j = 1, 2, \dots, m$. Arrange $|r(DF, \partial_j)|$ in descending order and re-index the associated variables ∂_j accordingly.
5. Compute $Z_i = \sum_{j=1}^m \left[\left(\frac{d_{ij}}{\sigma_j}\right) w_j\right]$; $i = 1, 2, \dots, n$; $w_j = (1 - R_{j,j-1,\dots,1}^2)$ for $j = 2, 3, \dots, m$ and $w_1 = 1$.
6. If $\sum_{i=1}^n (DF_i - Z_i)^2 \geq \varepsilon$ replace DF by Z go to d), else stop.

Thus defined, the DP₂ is the sum of the distances between the values of variable i in the city j and the minimum values for the variables in all cities, weighted by the unexplained variance of X_i and the variance X_i . A greater distance from the worst theoretical condition shows a higher DP₂ value, indicating an high index value, whereas, a lower distance from the worst theoretical condition describes a scarce level of DP₂.

We used the same methodology to create the index of Knowledge Economy and Innovation (KEI), on the basis of:

- "Patents": Number of patents registered at the European Patent Office (EPO) (values per million inhabitants);
- "Production specialization": Production specialization in sectors with high technological knowledge intensity (per 100 employees of local units). Includes the high-tech manufacturing sectors
- "Income / Taxpayers Rate": the ratio between the declared income and the tax payers. Reference year 2015.

RESULTS AND DISCUSSIONS

The findings show the different ranking of the sampled Italian cities (Table Annex 1A).

Trieste, a medium-small city in the North East of Italy, is 1st Italian Smart Sustainable City, thank to a high level of Sustainable Local Transport (STL) and the creation of a Sustainable Safe Environment (SSE). In term of knowledge based economy, Trieste scores 13th; a good result for a small/medium city.

Milan (the second large Italian city after Rome) is at 10th position in the Smart Sustainable City Score (10th; SSC=6.36) and appears as the best performer in terms of Sustainable Local Transport (1st; SLT=9.20). Milan is also the leader in Knowledge Economy and Innovation (1st; KEI =10.33); in this

case, the status of large city, with public policies aimed at enhancing the level of urban smartness and sustainability in terms of quality of life, has nurtured and stimulated the knowledge-based economy, confirming academic contributions on the urban development and knowledge city (Table 2).

Very interesting is the other best performer cities in SSC that are also in the top ten of KEI. Bologna (large city) and Modena (medium sized city) are in the same Emilia Romagna Region. They are characterized both by a high score in SSC (respectively 7th and 3rd) and in KEI (respectively 2nd and 4th). Focusing on the sub-indexes, Modena is 4th in Sustainable Urban Environment (SUE) and 1st in Sustainable Social Services (SSS); Bologna is the 3rd in the Sustainable Social Services (SSS). The cases of Bologna and Modena are particularly interesting for the efforts expended in a public policies approach characterized by a high degree of interconnection and cooperation between the various actors, resources and tools in order to enhance sustainability and citizen's quality of life.

It is important to underline that Bologna hosts one of the oldest universities in the world, University of Bologna, founded in 1088, with large student body which takes part to the local social, economic and cultural life. The urban area is characterized by typical of medieval settlements layout with concentric rings areas and narrow streets that have allowed the creation of area forbidden to the traffic. The same is for Modena that is a historical city with 190,000 inhabitants and an important academic hub.

It is no coincidence that the top cities in SSC have recently implemented dictated policies, making the city governments' activities more coherent. These policies aim to enhance both the level of sustainability and the quality of life and their competitiveness in order to retain and attract new talents. In the contemporary economy, in fact, cities are in competition with each other in attracting investments, business, inhabitants and tourists and to improve citizens' satisfaction. In order to deal with this competition, cities use different tools: strategic planning, marketing strategies, city branding, etc.

In particular, having dictated policies brings the following value to cities: increased competitiveness, resulting in a positive impact on investment, jobs, inhabitants, visitors and events; higher returns on investment in real estate, infrastructure and events; coherent city development, as the physical, social, economic and cultural aspects combine to deliver the brand promise; pride in the city as the inhabitants, businesses and institutions experience a new sense of purpose and direction.

These results have found that the smart sustainable top cities are mainly located in Northern Italy (an exception is Cagliari) and are prevalently medium sized city; policies aimed at enhancing the level of quality in social and environment-sustainability have promoted the creation of more attractive environment that in specific case have helped to stimulate a knowledge based economy.

It was also chosen to compare, through the Spearman rank correlation coefficient, SSC results with KEI. Pearson's correlation is moderately good (0.567). The findings demonstrate that a high score in SSC is a moderate predictor of KEI attitude at city level, confirming that a smart sustainable environment can help the development of a knowledge base economy.

The level of smartness and the sustainability of a city is positively correlated with the following sub-indexes: Sustainable Social Services (SSS=0.729), Sustainable Urban Environment (SUE= 0.696) and Sustainable Local Transport (SLT=0.605).

In order to understand which profiles of smart sustainable city are more propulsive in order to stimulate the knowledge based economy domain, the empirical outcomes test moderate but significant correlation. The component more correlated with KEI Index is described by Sustainable Social Services (SSS) and Sustainable Local Transport (SLE) (Table 3).

Regarding the urban size (measured in term of population), while the association with SSC is very low because also smaller cities can be smarter and more sustainable than the larger one (unsurprised is the negative association between the urban safety/security and the urban size), there is a positive and significant correlation between KEI and the population of a city, confirming that a large urban environment is important in order to stimulate knowledge base economy and innovations.

Urban Environment (SUE)		Sustainable Social Services (SSS)		Sustainable Local Transport (SLT)		Sustainable Safe Environment (SSE)		Sustainable City (SSC)		Knowledge Economy and Innovation (KEI)	
Pordenone	15.57	Modena	15.31	Milan	9.20	Trieste	6.68	Trieste	12.34	Milan	10.37

Table 3 – Correlations

CONCLUSION AND FURTHER RESEARCH

The present paper is focused on the relationship between the concept of smart sustainable city and the knowledge based economy at the city level.

We have created a new composite index called Smart Sustainable City (SSC) and we have applied this model to 116 Italian Cities, the provincial capital cities and metropolitan cities of Italy. Secondly, on the basis of a set of sub-indexes, we have studied a relationship between each profile of sustainable smart cities and Knowledge Economy and Innovation (KEI). Finally we measured the relationship between SSC and Population in terms of inhabitants, in order to understand the smart and sustainable attitude of the different sized cities.

The present paper have tried to answer two main research questions.

First of all, the empirical results have demonstrate that there is a positive association between the profiles of a smart and sustainable city environment and the existence of a urban knowledge-based economy; secondly, the profile of the smart and sustainable city that is more conducive to stimulate the urban knowledge-based economy is the level of Sustainable Social Services (SSS) that help to improve the quality of life. The correlations with the urban size have demonstrated that while the level of knowledge economy and innovativeness present a positive and significant association with the urban size, the high level of services and the quality of life is proper also of medium and small cities, especially in the Nord of Italy. This profile can help the smaller urban centres to favourite their economy, nurturing knowledge workers that are attracted by the level of quality of life.

In conclusion, challenging the theme of smart sustainable city and knowledge-based economy, our study yields several insights.

Our work tries to contribute to the debate on urban economic development in terms of smartness and sustainability in a perspective of a knowledge-based economy, providing implication for academics and urban policy makers, especially for smaller cities.

This contribution presents some inherent limitations, which might be challenged in future research. Firstly, the investigation is performed only on Italian cities; further studies are therefore required to enlarge the sample of cities, including other urban areas and to make a comparison with other relevant European Countries (e.g., Southern/northern range). In addition, the number of variables and attributes referred to each dimension might be expanded, embodying also additional perspectives, which could reasonably contribute to achieve a better understanding of the determinants affecting the smartness and the sustainability and their impact on the Knowledge based economy at urban level.

ADVERTISEMENT AS A MEANS OF ENVIRONMENTAL INFORMATION AMONG KINDERGARTEN STUDENTS

Petkou, Daphne

Department of Forestry and Management of Environment and Natural Resources, Democritus University of Thrace, Greece

ABSTRACT

Advertisements often refer to the environment with the aim to take advantage of consumers' environmental concerns to promote the advertised products. Children are considered particularly vulnerable to the barrage of messages contained in advertisements and are affected deeply by advertisements which evoke in them positive or negative feelings because children do not have the knowledge and the ability 5e way as adults do. Children aged between four to six years account for 52.4% of the television audience while consisting of the target group of most advertising spots. Advertisement has, moreover, the ability to touch upon the child's psychic aspects, reason, emotions, and behavior. The aim of the present paper is to investigate the contribution of the advertisement to the diffusion of environmental information among children in early childhood. Specifically, this study aims at building a conceptual scale to measure the contribution of advertisement to the diffusion and acquisition of environmental knowledge as well as at defining basic factorial axes which interpret the contribution of advertisement to the acquisition of knowledge and information on the environment. The study data were collected with the help of a properly designed questionnaire which was completed through personal interviews by parents who had at least one child in early childhood (nursery school students). The sample was chosen randomly and consisted of 65 parents who filled in the questionnaire. The performance of Principal Component Analysis gave four factors which account for 66.2% of the total variance. The first factor (F1) can be identified as the component of the advertisement contribution which expresses "knowledge on food and eating habits". The second factor (F2) can be identified as the component of the advertisement contribution which expresses "Fires and forest protection". The third factor (F3) refers to the contribution of advertisement to topics related to recycling and packaging materials and could be termed "Recycling and packaging materials". The fourth factor (F4) expresses the contribution component that focuses on "Endangered animals-care".

Keywords: Environmental communication, Mass Media, Principal Component Analysis, nursery school students.

1. INTRODUCTION

Environmental information

Mass media as tools of informal environmental education diffuse environmental information through news programs, environmental information programs and relevant debates on environmental topics thereby affecting the public with their power. It is possible to diffuse environmental information in appropriate ways in order to emphasize the real aspects of environmental issues and provide possible ways of resolving them (Skanavis and Sakellari, 2008).

The influence of environmental information depends on how much the public understands it, the correlation of the information with the public's daily life, the recipients' education level and their psychological predisposition of responding to the suggested ways of environmental action (Noel, 2009).

The content of environmental information ought to comply with the needs, characteristics and lifestyle of the public it addresses so that information becomes comprehensible and digestible. In other words, citizens become aware of a topic when they perceive that the topic concerns and affects them.

In addition, the media are solely engaged in diffusing environmental information but without enhancing the degree of environmental awareness but only by providing unconnected information. The media often present individual events in superficial ways without examining in depth the causes of the events or how to address them (Booth et al., 2012). Nevertheless, if the media present more often the criticality of environmental issues and point to significant ways of tackling them, then they can consist a pole for strengthening environmental awareness and providing motives for promoting environmental action.

In advertisement, the lack of information on the product creates negative feelings to the consumer, whereas positive feelings of trust in the product are evoked when the advertisement is adequate and comprehensive (Kourtis, 2008).

Environmental knowledge must lead to environmental awakening and mobilization since it many times cultivates environmental consciousness and awareness, while it contributes to the gradual shaping of an environmentally responsible citizen (Skanavis, 2004; Tsantopoulos, 2009).

The characteristics of advertisement

In our era, the advertisements of environmental organizations are increasingly appearing in the media as they consist part of programs on television, radio and the Internet. At the same time, the presentation of a product can cultivate new behavioral patterns and form new values. Television,

radio and the Internet consist the three most popular media which host advertisements (Gulas and Weinberger, 2006).

The aim of informative advertising is to provide information on the characteristics, the attributes and the use of the advertised product, while persuasive advertising seeks to persuade on the product by attracting the interest and attention of consumers. In addition to these types of advertising, reminder advertising tries to remind consumers about an old product and reinforcement advertisement tries to reinforce the popularity of the product (Preston, 2005).

The success of advertisement will depend on the percentage of product use among consumers. On the other side, consumer behavior refers to every activity relating to the purchase and use of products and services. It also involves consumers' emotional, mental and behavioral responses which have to be grasped and comprehended by the advertiser so that the purchase decision of the consumer is influenced through the advertisement (Mohan, 2008).

Beside product promotion, advertising also aims at behavior shaping, perception and value adoption so that individuals organize their thoughts and understand the world they live in (Lagouri, 2012).

The effectiveness of the "art" of persuasion lies in the clarity and comprehension of the information sent by the message transmitter. However, the success of communication is attributed to the reliability of the sender and on the nature of the message which has to be simple and digestible (Zotos, 2008).

Advertisement's influence level on the consumers' reason is dependent on their attention, perception, memory and thinking. The stronger the effect of the advertisement stimulus on human sensory organs, the higher the attention level the advertisement receives (Soldator, 2006).

Sloganned discourse, stereotyped expressions, and the so-called slogans which are characterized by originality, relevance, epigrammatic content, humor and connotation creation consist the main elements of advertisements. The interchange of monologue and dialogue or the exclusive use of each can provide the recipient with all necessary information thereby forming a lively and natural text (Greek Ministry of Education and Religious Affairs-Centre for Environmental Education, 2004). The reinforced texts are framed by music, sounds and images which transfuse their own felt characteristics.

The child and environmental information

Advertisements often refer to the environment with the aim to take advantage of consumers' environmental concerns to promote the advertised products. According to Gillian Dyer (2003), to advertise means to "draw one's attention on something", to make something known to someone and

to provide information about it. Therefore, advertising is reporting news through fame, oral discourse or publishing the virtues of a person or thing (Dikopoulou, 2011 and Katsiki, 2012).

Environmental advertisement presents the relationship between the commodity/service and the bio-physical environment while promoting an environmentally responsible lifestyle with or without emphasizing the commodity/service. Moreover, the evaluation of advertisement in the course of time indicates that in advertising the environment acquires an increasingly extensive position limiting the advertised product either in the middle or to the side of the fact. At the same time, the environment and the beauty of nature are used in commercial advertisement to evoke the emotion of the consumer so that the consumer connects the product with pleasant emotions.

Environmental advertisements make public the environmental issues with the main purposes being the promotion of friendly environmental messages, awareness raising of public opinion and the facilitation of the adoption of attitudes and behaviors which are compatible with and not harmful to the environment and encourage the individual's active participation in environmental protection and solution of environmental issues. What is more, environmental advertisement aims at information enrichment, product promotion and persuasion, while advertising statements on the environment may focus on environmentally friendly characteristics or the productive process and the method which involves environmental benefits.

As Papathanasopoulos (2004) states, in advertisement environmental statements must contain thorough information, present the product characteristics which benefit the environment, provide description or explanation of all technical terms and examine the relationship between the source of environmental improvement and the relationship of consumers with the product with the aim of reinforcing environmentally responsible behavior.

Children are considered particularly vulnerable to the barrage of messages contained in advertisements and are affected deeply by advertisements which evoke in them positive or negative feelings because children do not have the knowledge and the ability 5e way as adults do (Hetsroni, 2012). According to Comcon-Media (2007), children aged between four to six years account for 52.4% of the television audience while consisting the target group of most advertising spots. The children belonging to this age group spend on average two hours a day watching television thereby becoming unconsciously the "easy target of advertisement" (<http://www.ccmed.ru/research/57831/01/2007.htm>).

Moreover, children receive information from their external environment without being able to critically process this information. That is because during childhood the brain absorbs every information while critical analysis occurs after years (Titova 2004). It is also clear that children lack the

irritation that often results from repeated spots and instead children consist the most willing and faithful viewers of the same spots.

Advertisement has, moreover, the ability to touch upon the child's psychic aspects, reason, emotions and behavior. However, children cannot perceive the advertiser's intention to persuade them to obtain the advertised product. For this reason, advertisement with the method of psychological influence often becomes illicit persuasion, brainwashing and visual coercion (Wanke, 2009).

Additionally, being at the development stage, children confuse reality with imagination and do not know how to discern the advertisement from the content of the media. At the same time, the provided information on the product can be false since only one environmental benefit is presented thereby implying that overall the product is environmentally friendly (Sanrock, 2011). Meanwhile, an interestingly created message is easily absorbed and retained in memory for long (Telis, 2015).

The aim of the present paper is to investigate the contribution of the advertisement to the diffusion of environmental information among children in early childhood. Specifically, this study aims at building a conceptual scale to measure the contribution of advertisement to the diffusion and acquisition of environmental knowledge as well as at defining basic factorial axes which interpret the contribution of advertisement to the acquisition of knowledge and information on the environment.

2. MATERIALS AND METHODS

The study data were collected with the help of a properly designed questionnaire which was completed through personal interviews by parents who had at least one child in early childhood. The questionnaire was designed based on relevant studies which were conducted either in Greece or in other countries (Heinrichs and Kierman, 1994) and the design was adjusted to the subject of the present study. The sample was chosen randomly and consisted of 65 parents who filled in the questionnaire. The study was carried out from February to June 2019 and initially focused only on preschool students (nursery school students). It should also be noted that the kindergarten teachers of the concerned preschools participated in the study in an advisory manner. The questionnaire included two sections with 16 questions in total.

The first section involved questions gathering information about the demographic characteristics of the respondents. The registered variables involved gender, age, family status, occupational status, education level, number of children, as well as the child's gender and age. The second section consisted the main part of the questionnaire and contained thematic questions related to advertisements and their influence on the diffusion of environmental knowledge among preschool children.

Most questionnaire items were multiple choice and closed-ended questions while the surveyed parents were required to mark their answers on a five-point Likert scale. The method of descriptive statistics was used to briefly present the available data. Moreover, all statistical analyses were performed using the Statistical Package IBM SPSS ver. 20.0 with the installation of the subsystem Exact Tests.

More specifically, Principal Component Analysis (PCA), was applied to examine the structural cohesion of the questions which consisted the “variables” that composed the axes of the contribution of advertisement to the diffusion and acquisition of environmental knowledge but also to explore their importance (Hair et al., 1995, Sharma, 1996, Menexes and Aggelopoulos, 2008, Petkou, 2018).

The possible grouping of questions in components/axes aims to:

- a) highlight the relative importance of the sub-questions in each component of the advertisement contribution,
- b) highlight the relative importance of the components of advertisement contribution.

To achieve these purposes, Principal Component Analysis with Varimax rotation (using orthogonal rotation of maximum variance) was applied to the available data, while components with eigenvalues greater than or equal to 1 were considered important.

3. RESULTS

The performance of Principal Component Analysis gave four factors which account for 66.2% of the total variance (Table 1). In addition, the total reliability of the scale for contribution measurement was very satisfactory since the Cronbach’s alpha scored 0.887.

CATPCA

Dimension	Cronbach's Alpha	% of Variance
F1	0.871	42.1
F2	0.849	11.8
F3	0.731	7.5
F4	0.518	4.8
Total	0.887	66.2%

Table 1. Results of the application of Principal Component Analysis

The analysis indicated that the first factor (F₁) accounts for 42.1% of the total variance and is highly reliable since Cronbach’s alpha scored 0.871. The first factor consists mainly of the questions q5, q6 and q7 and can be identified as the contribution component that expresses “*Knowledge on food and eating habits*”.

The second factor (F₂) accounts for 11.8% of the total variance and is highly reliable with Cronbach's alpha having a value of 0.849. This factor consists of questions q8, q10 and q13 and can be identified as the contribution component that focuses on "*Fires and forest protection*".

The third factor (F₃) accounts for 7,5% of the total variance with a high reliability index (Cronbach's alpha 0.731) and consists mainly of the questions q11 and q9. Based on the conceptual content of these questions, this contribution component can be referred to as "*Recycling and packaging materials*".

The fourth factor (F₄) accounts for 4.8% of the total variance with a satisfactory reliability (Cronbach's alpha 0.518) and contains the questions q14 and q16. This factor expresses the contribution component which focuses on "*Endangered animals-care*".

Next, Table 2 presents the extracted components of advertisement's contribution to environmental information.

Components of advertisement contribution		Mean	Std. Deviation
1st component (F1): "Knowledge on food and eating habits"			
Q5	Knowledge on food chain and Mediterranean diet	3.2	1.1
Q6	Knowledge on food production	2.6	1.2
Q7	Information on food composition	3.6	1.1
		3.13	
2nd component (F2): "Fires and forest protection"			
Q8	Information about the causes of fires	3.7	0.6
Q10	Information about the forest and its usefulness	4.4	0.5
Q13	Information about forest animals	3.7	0.7
		3.93	
3rd component (F3): "Recycling and packaging materials"			
Q11	Information about ways to recycle	3.9	0.6
Q12	Information about the usefulness of recycling	3.4	0.9
Q16	Information about packaging materials	3.9	0.6
		3.73	
4th component (F4): "Endangered animals-care"			
Q14	Information about endangered animals	3.7	0.7
Q15	Information about the need for fauna protection	4.0	0.7
		3.85	

- Table 1 shows only the loadings with absolute values ≥ 0.50 . Loadings of this range and for the specific sample size are statistically important at significance level $\alpha=0.05$ and power level 0.80.

Table 2. Structural analysis of the advertisement contribution components

The same table, moreover, shows the components' constitution based on the questions that formed them and the mean rates of the given answers. As it appears in Table 2, in the first and third dimension of contribution children expressed a neutral to medium degree of agreement and acceptance of the contribution of advertisement since the mean rates of the relevant questions consisting the specific components were 3.13 and 3.73, respectively. In the second and fourth dimension, children expressed a more positive degree of agreement since the mean rates of the relevant questions that constituted these components were 3.93 and 3.85, respectively.

The first component (F_1) consists of the questions q7.1, q5.2 and q6.2 (in declining order of significance) and expresses the contribution of advertisement to eating habits (for instance Mediterranean diet, food chain, food production and composition). Hence, this component may be termed "*Knowledge on food and eating habits*".

The second component (F_2) is composed of the questions q10, q8 and q13 (in declining order of significance) and describes the contribution of advertisement to information about the causes and consequences of fires and forest protection. Hence, it could be titled "*Fires and forest protection*". Based on the overall mean rate of the relevant questions it is shown that children expressed the highest degree of response in the section that concerned the knowledge on forest and its usefulness followed by the provided information about the causes of fires and endangered animal forests.

The third component (F_3) is made up of q11, q16 and q12 (in declining order of significance) and expresses the contribution of advertisement to the notion and role of recycling. Through advertisements children acquire knowledge on packaging materials and their relationship with recycling. Therefore, it could be termed "*Recycling and packaging materials*". Moreover, in view of the overall mean rate of the relevant questions it is indicated that children expressed the highest degree of response in the section relating to information about ways to recycle and knowledge on packaging materials.

The fourth component (F_4) consists of the questions q15 and q14 (in declining order of significance) and expresses the contribution of advertisement to information about endangered animals and the necessity for their protection. It could be termed "*Endangered animals-care*". Based on the overall mean rate of the relevant questions, it is revealed that children express the most positive degree of response to the knowledge on the need for fauna protection which is provided by advertisements.

The following diagram presents the four components regarding the diffusion and acquisition of environmental knowledge.

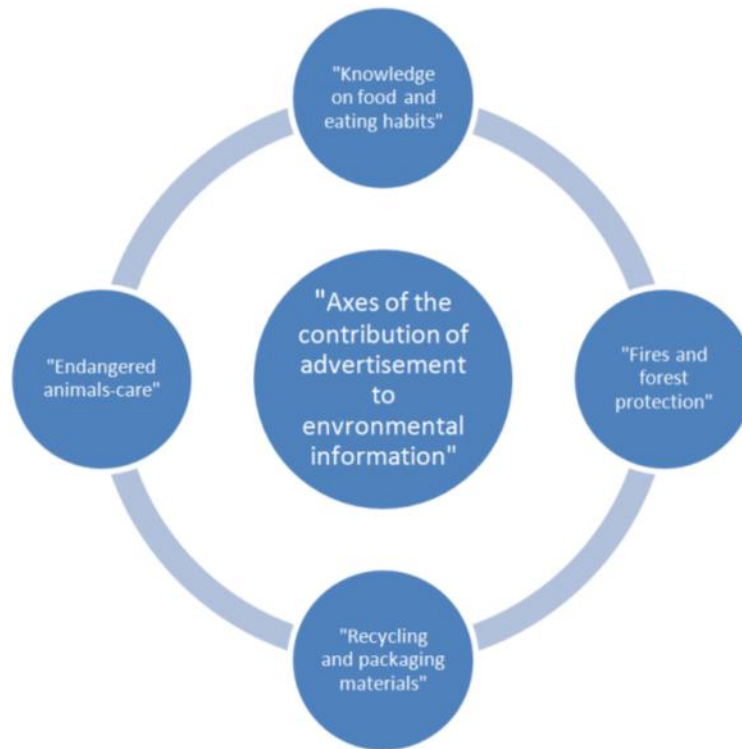

Diagram 1. Structural analysis of the advertisement contribution components

4. CONCLUSIONS

The aim of the present paper was to investigate the contribution of the advertisement to the diffusion of environmental information among preschool children. In specific, this study aimed to conceptually construct a scale to measure the contribution of advertisement to the diffusion and acquisition of environmental knowledge as well as to define the basic factorial axes which interpret the contribution of advertisement to environmental knowledge and information input.

To examine the structure of the factors associated with the degree that advertisement contributes to the diffusion and acquisition of environmental knowledge among preschool children, the non-linear categorical analysis in principal components was used. The application of this method revealed four significant components which accounted for 66.2% of the total variance:

The first factor (F_1) accounted for 42.1% of the total variance and had high reliability (Cronbach's alpha 0.871). This factor can be identified as the component of the advertisement contribution which expresses "knowledge on food and eating habits".

The second factor (F_2) accounts for 11.8% of the total variance and has also high reliability with Cronbach's alpha being 0.849. This component is an expression of the contribution of advertisement to

information about the causes and consequences of fires and forest protection. It could be titled "Fires and forest protection".

The third factor (F_3) accounts for 7.5% of the total variance and has a high reliability index with Cronbach's alpha being 0.731. This component refers to the contribution of advertisement to topics related to recycling and packaging materials and could be termed "Recycling and packaging materials".

The fourth factor (F_4) accounts for 4.8% of the total variance with satisfactory reliability as the Cronbach's alpha scored 0.518. This factor expresses the contribution component that focuses on "Endangered animals-care".

In view of the above, it is indicated that in the composition and definition of a "model" which describes the contribution of advertisement to the diffusion of environmental knowledge and information, children expressed the highest degree of response to topics related to forest and its usefulness. Moreover, children expressed positive responses to information relating to ways to recycle and packaging materials.

The knowledge about the influence of advertisement on the diffusion of knowledge and information about the environment is of particular importance since it can contribute to environmental education and raising environmental awareness among preschool children. Preschool educators should exploit this potential by including advertisement into the implemented environmental programs.

THE IMPACT OF INNOVATION ON ECONOMIC PERFORMANCE AND ON STOCK MARKET VALUATION OF 100 COMPANIES ON THE STANDARD & POORS 500 INDEX

Pettas, Lampros; Lois, Petros; Repousis, Spyros

University of Nicosia

ABSTRACT

Purpose: The purpose of this study is to investigate the impact of innovation on economic performance and on stock market valuation of 100 companies on the Standard & Poors 500 Index for years 2017 and 2018.

Design/methodology/approach: Financial statements collected from the USA Securities and Exchange Commission's website and analyzed with SPSS statistical software. Companies separated into two categories depending on whether or not they include in their balance sheets technological actions and costs in research and development.

Findings: The impact of innovation on the economic performance of companies, confirm the disagreement between the findings of the existing studies that were observed during the bibliographic review. There is a moderate positive linear correlation between the change in costs in innovation actions and the change in sales and gross profits. This means that sales and gross profits are affected by the change in research and development costs, but not to a large extent. About the impact of innovation on stock market valuation, no linear correlation was found between the change in costs in innovation actions and the stock valuation as expressed by the P/E index. Also, investment in R & D does not affect the share price of companies or investors' decisions

Originality/value: Companies investing in R & D have, on average, higher sales growth, comparing with companies that do not invest in R & D and this is a very important element to be taken seriously into account by all companies.

Keywords: Innovation, Standard & Poors 500 Index, economic performance, stock market

1. INTRODUCTION

Innovation is increasingly an important feature in companies' efforts to gain competitive advantage. Innovation almost always starts with an idea and transforms itself into a business, adding value and commercializing it in order to generate profit.

The term innovation at a business level was first formulated by Schumpeter (1934) and according to its definition is a new combination that can take one of the following five forms: the introduction of a new product or product with qualitative improvements, the introduction of a new production method, the launching of a new market, the supply of raw materials from a new source and the establishment of a new form of organization.

The third edition of the Oslo Manual defines innovation as the integration of a new or significantly improved product or service, process, marketing technique or new organizational method into business practices, the organization's work environment or external relations (OECD and Eurostat, 2005).

The innovation of a business is often based on a concept that it exploits commercially, with the aim of generating profits and increasing its performance. As Rosli and Sidek (2013) refer, innovation is only useful when the benefits gained from it are more than the costs invested to create.

Innovation is considered to be the most important factor in the effort of companies to gain competitive advantage and to grow, but on the other hand, innovation may be considered that is not directly linked to the growth and success of companies.

This study analyzes the different dimensions in which innovation is expressed and then focuses on its technological dimension, as expressed by R & D costs for enterprises. The main purpose is to investigate the relationship of technological innovation with the economic results and stock market valuation of companies using linear regression. In section two, literature review will be presented and in the next section methodology and data will be analyzed. In section four and five, will take place a graphical presentation of empirical results and hypothesis testing. In the last section six, conclusions will be presented.

2. LITERATURE REVIEW

According to Katimertzopoulos and Vlados (2017), the invention that generates an innovative action can come from business strategy, technology or management. These three factors make up a triangle, which these researchers call Stra.Tech.Man, which is crucial for the efficiency of innovation in business. From any of the three factors, an innovative action is bound to affect the other two and ultimately a new redefinition will occur and there will be a new balance between these factors (Katimertzopoulos and Vlados, 2017).

More and more in modern times, innovation is expressed in a disruptive innovation. Disastrous innovation occurs when a new technology presents many advantages and gives consumers more convenience, so that the so-called dominant product or service has so far been abolished or obliterated (Bower and Christensen, 1995).

In this respect, the crisis at both company and economic level must be seen as something inevitable, expected and reasonable. Any crisis that comes will only be overcome if anything inefficient and productive is eradicated and replaced with something new (Vlados et al, 2018).

In an ever-changing environment, innovation is, the most important factor that can give a sustainable competitive advantage to businesses that is difficult to replicate. Indeed, due to the high competition in almost all sectors and the shorter life cycle of products, the ability to create innovation is more important than ever (Atalay et al., 2013). Innovation is likely to be influenced by the company's size, market structure, technological opportunities and the company's internal liquidity (Geroski et al., 1993).

A way to measure innovation of a company is to examine its R & D costs. Although it is an easy way to measure, as in the Oslo Manual, spending on research and technology does not include all the innovation actions a company has, since it does not include the know-how they gain from investment in new machinery and human resources (Hashi et al., 2012). Thus, in this way, the technological dimension of innovation is measured.

Other ways to measure innovation are the number of successful patents obtained each year or the innovative efficiency, i.e. the number of patents earned to the costs incurred for this purpose (Hirshleifer et al., 2012).

The effectiveness of a company according to Rosli and Sidek (2013) is the results achieved when the internal and external goals of a company are met. Efficiency is usually multidimensional and includes the growth, success and competitiveness of the company. Business results are typically measured in terms of productivity as sales per employee (SpE), in terms of growth as a percentage of sales growth or earnings growth, and often in economic terms, such as return on assets (ROA) and return on investment (Hashi et al., 2012; Bartolacci et al., 2015, Rosli and Sidek, 2013).

The valuation of a company is its true value as perceived by investors with all available news, technical analysis and published financial statements. The valuation of a company can be expressed by the change in its market value, but also by the change in the market to book value (Hirshleifer et al., 2012).

Studies have collected primary empirical data, mainly using questionnaires (Rosli and Sidek, 2013; Atalay et al., 2013; Hult et al., 2003; Gok and Peker, 2016). Other studies have collected secondary data from trusted and trusted sources such as Compustat, CRSP, Business Source Elite (EBSCO), Community Innovation Survey (CIS), NYSE and NASDAQ, or from the published financial statements of the companies (Hirshleifer et al., 2012; Rosenbusch et al., 2009; Hashi et al., 2012; Bartolacci et al., 2015).

Analyzing data and concluding into existing publications has been done in different ways. Sood and Tellis (2009) analyzed the long-term performance of companies from specific innovation events using event analysis based on the Fama and French model of three factors (Fama and French, 1993), including factor momentum of Carhart (Carhart, 1997). An original approach was by Rosenbusch et al. (2009), which collected data from 42 scientific articles with data from more than 21,000 companies worldwide, and carried out a meta-analysis of these data.

Hashi et al. (2012) analyzed the secondary data available to them using a four-stage model, while Rosli and Sidek (2013) analyzed the data collected by small and medium-sized enterprises in Malaysia using a hierarchical linear regression model. Similarly, Atalay et al. (2013) with the use of the SPSS statistical package in the data analysis received from Turkish car industry, while Bartolacci et al. (2015) applied a model based on entropy.

The impact of innovation on business efficiency does not coincide with all the researches. For example, Hirshleifer et al. (2012) found that companies that incorporate innovation efficiently have higher market valuations and higher operating returns. Also, Atalay et al. (2013) and Rosli and Sidek (2013) concluded that innovation in products and processes has a statistically significant effect on company performance. Instead, Gok and Peker (2016) found a negative relationship between innovation and economic performance, from the data of the companies they collected.

3. METHODOLOGY AND DATA

Subsequently, in our study, the companies will be divided into two groups. The first group will include those investing in innovative actions, while the second group will include those that do not have such investments at their expenses.

The data gathered for this research is secondary, as these are objective, official, reliable and comparable data for companies. The data were collected from the official published financial statements of the companies and in particular from the income statement and the balance sheet as they are posted to the Securities and Exchange Commission (www.sec.gov). This site is the official government site where all corporate announcements and changes are posted for all US companies and has a very easy to use search engine.

This source is considered to be the most valid and accurate and the information it provides is readily available. Some individual assets, such as the number of each company's stock and the stock price of the shares at the beginning and end of the financial year, were collected by Yahoo Finance (<https://finance.yahoo.com>), a website dedicated exclusively to economy and the financial markets. All data was collected manually, since there is no automatic way to recover them.

The data sample is the 100 higher capitalized companies on the Standard & Poors 500 index of the United States of America. The selection of the companies was made according to the classification by capitalization on 30th September 2018 by Sibilis Research, which can be found at the electronic link <http://sibilisresearch.com/data/market-caps-sp-100-us>. These 100 companies, which are shown in the Table 1, are from different sectors and industries of the US economy.

Table 1. 100 higher capitalized companies of Standard & Poors 500 index, end September 2018

Company name	S&P 500 Code	Industry

An important element in the data collection was that while the financial statements were in all companies on an annual basis, the period to which they relate may vary from company to company. Thus, for example, a company's results may range from 1st January 2018 to 31st December 2018 and some other company for the period from 1st March 2018 to 28th February 2019. In any case, the data collection relates to the latest financial/accounting period of the companies.

Consequently, the recording of the closing price of the shares of the companies corresponds to the periods mentioned in the respective financial reports. For example, if for a company the use of 2018 was in the period 1st November 2017 to 31st October 2018, the closing price of the company's share, in order to be capitalized, concerns the share price at 31st October 2018.

In addition, in order to be able to deduct the rate of increase or decrease in sizes, it was considered appropriate to collect the same data for the previous financial year, which concerned the year 2017.

The data collected from the income statement was income, sales, gross profit, net profit and R & D expenses. Of the 99 sampled companies, only 44 spent on R & D activities, while the remaining 55 did not have such costs.

A statistical test will be made for the averages of the population of the two groups first in relation to the percentage change in sales and then in relation to the percentage change in the stock market value of the companies. Thus, the following two hypotheses will be tested:

Hypothesis I: The average percentage change in sales of companies investing in innovative actions is higher than the average of companies that do not invest in innovative actions.

Hypothesis II: The average percentage change in the stock market value of companies investing in innovative actions is higher than the average of companies that do not invest in innovative actions.

4. GRAPHICAL PRESENTATION OF EMPIRICAL RESULTS

Since the volume of data and the calculated ratios is very large, it was considered appropriate to group them into scatter-plots so that there is a full picture between the variables. For the graphs, listed below, but also for linear regression models and hypothesis tests, the SPSS statistical packet was used.

Graph 1. Sales and Expenses of Research and Development of companies for the years 2017 and 2018 (amounts in thousands \$)

Graph 2. Gross profit and expense in research and development of the companies for the years 2017 and 2018 (amounts in thousands of \$)

Graph 3. Net profit and loss on research and development of the companies for the years 2017 and 2018 (amounts in thousands of \$)

From the above graphs 1, 2, 3, it is clear that the correlation of R & D spending is much stronger with sales and gross profits than with net earnings. This may be because in order to generate net earnings from gross profits, several categories of expenses are deducted, such as advertising and marketing costs, sales, administration and taxation costs. Next, the graph 4 shows the percentage change in research and development costs from financial year 2017 in the year 2018 and the corresponding percentage change in sales.

Graph 4. Percentage change in sales and research and development costs of companies

If the percentage change in gross profits is entered on the vertical axis, the following graph 5 will be presented.

Graph 5. Percentage change in gross profit and expense in research and development of companies

In the above two graphs 4, 5, there is a correlation between the variables and having checked and ruled out the possibility of coming from an error in the input of the data, it will be considered in the data breakdown by amount to be excluded.

In the next three graphs 6, 7, 8, the cost of research and development was selected on the horizontal axis as a percentage of sales and the vertical axis the calculated figures, i.e. ROA, P/BV and P/E.

Graph 6. Expenses in R & D as a percentage of sales and ROA of the companies for the years 2017 and 2018

Graph 7. Research & Development Expenses as a percentage of sales and P/BV of the companies for the years 2017 and 2018

Graph 8. Research & Development Expenses as a percentage of sales and P/E of the companies for the years 2017 and 2018

By observing graphs 6, 7, 8, it seems that there is no strong linear relationship between the variables. Finally, graph 9 depicts the percentage change in R & D expenditure from 2017 to 2018 and the P/E figure.

Graph 9. Percentage change in R & D costs of sample companies and P / E ratio

5. HYPOTHESIS TESTS AND EMPIRICAL RESULTS

We will select the variables to be used for the controls of the two research questions and hypothesis tests. To control the impact of technological innovation on companies' financial results, the linear regression method will be used.

The independent variable to be used will be the percentage change in the company's innovative technology-related actions from one financial year to the next and will be measured by the costs spent on research and development, and the dependency will initially be the percentage change in sales and then the percentage change in the gross profits of the companies.

At this point, it is important to note that although graphs show that R & D expenditure has a strong correlation with both sales and gross profits, it was not chosen to use these variables but the percentage changes.

It is reasonable and likely that companies of the size of Apple or Amazon will have more sales and therefore more resources in research and development than smaller companies. It was chosen to use the percentage changes in order to have an equalization of the companies and to check whether the change in research and development costs leads at the same time to a positive or negative change in the sales and mixed profits of the companies.

In order to control the impact of technological innovation on the stock exchange valuation of companies, the percentage change in R & D spending from one financial year to the next, and as a dependent variable, the P/E ratio of the latter year. In this way, we checked whether the changes in R & D spending have a positive or negative impact on investors, namely the tendency of investors to overstate or depreciate their shares, depending on changes in technology investments.

Subsequently, companies divided into two categories depending on whether or not they include in their balance sheets technological actions and costs in research and development. With the hypothesis test method, it will be examined whether the two categories have statistically significant differences initially in the growth rate of sales and then in the change in their stock market value.

5.1 Effect of technological innovation on economic outcomes

The first test of the impact of technological innovation on companies' financial results will be as previously reported, using as an independent variable the annual percentage change in R & D expenditure and as a percentage of the annual sales change. The method to be used is linear regression and SPSS will be used. Results are as shown in table 2 and graph 10.

Table 2. Descriptive statistics for companies with R & D expenditure**Explore****Case Processing Summary**

	Kurtosis	9,877	,702	

Graph 10. Boxplot for companies with R & D expenses percent change

The rules that follow the SPSS package to define an observation as extreme are related to the distance that this observation has from the boundaries of the rectangle box in the last boxplot. The boundaries of the box are defined by 25th percentile and 75th percentile, while the box height is designated as IQR

(Interquartile range). If an observation is more than $1.5 * IQR$ from the boundaries of the box it is described as an outlier from the statistical software and is presented with a circle in boxplot.

In addition, if an observation is more than $3 * IQR$ than the box boundary, it is marked as extreme by the statistical software and is shown as an asterisk in the boxplot. In our case, according to the boxplot, observation 17 of the data on the annual percentage change in research and development costs related to AbbVie Inc. can be considered extreme and can safely be removed, in order for the best fit of model.

From checking for extreme observations on the data of the dependent variable, i.e. data on the percentage change in annual sales of the companies, there was no other extreme observation.

The results of the linear regression model for the correlation between the annual percentage change in R & D expenditure and the annual percentage change in sales are shown in table 3 and graphs 11, 12, 13, 14.

Normal P-P Plot of Regression Standardized Residual

Graph 13. Scatterplot for dependent variable: Revenues percent change**Graph 14.** Linear regression for revenues percent change and R&D expenses percent change

The results initially show that the distribution of the residues in both the histogram and the Normal P-P plot follows the normal distribution and therefore simple linear regression can be applied. The percentage change in annual spending on research and development has a positive correlation with the annual percentage change in sales of companies.

As can be seen in graph 14, the estimated linear regression model is expressed by $Y = 0.07 + 0.5 X$. This means that when annual spending on research and development increases by 1%, it is expected that annual sales will increase by 0.5%. The Pearson linear correlation coefficient is 0.633 and

indicates that there is a moderate correlation of the two variables. The value of the coefficient is relatively small ($R^2 = 0.401$) and therefore the adjustment of the regression model to the sample data is not particularly good.

The second test of the impact of technological innovation on companies' financial results will again use as an independent variable the annual percentage change in R & D expenditures and as a consequence, the annual percentage change in the gross profits of the companies.

The test of the data on the percentage change in annual R & D expenditure is the same as in the previous test and according to boxplot remark 17 concerning AbbVie Inc. is considered extreme and can be safely removed in order for the model to better describe the rest of the data. Then the test for extreme observations and the data of the dependent variable, ie data on the annual percentage change of the gross profits of the companies, resulted in the following table 4 and graphs 15, 16, 17, 18.

Table 4. Descriptive statistics about gross profit percent change for companies with R&D expenses

Case Processing Summary

	Cases					
	Valid		Missing		Total

	Skewness	1,329	,357	
	Kurtosis	3,422	,702	

Graph 15. Boxplot about gross profit percent change for companies with R&D expenses

According to the boxplot (graph 15), observation 16 is based on data of the annual percentage change in the company's gross profits for DowDuPont Inc. it is extreme and can safely be removed. In addition, observations 2, 14 and 32 concerning Amazon.com Inc, Netflix Inc. are considered as outliers and Gilead Sciences respectively, and can also be removed in order for the model to better describe the rest of the data.

The results of the linear regression model for the correlation between the annual percentage change in R & D spending and the annual percentage change of gross profits are shown below.

Graph 16. Normal P-P Plot of regression standardized residual for gross profit percent change

Graph 17. Scatterplot for dependent variable: Gross profit percent change

Graph 18. Linear regression for gross profit percent change and R&D expenses percent change

The results show that the distribution of the residues follows the normal distribution and the dispersion pattern is randomly scattered. Therefore, there are appropriate conditions to apply linear regression. The percentage change in annual spending on research and development has a positive correlation with the annual percentage change in gross profits of companies.

As can be seen in graph 18, the estimated linear regression model is expressed by $Y = 0.08 + 0.49 X$. This means that when annual spending on research and development increases by 1%, it is expected that annual gross profits will increase by 0.49%. The Pearson linear correlation coefficient is $R = 0.694$ and indicates that there is a moderate to high correlation between the two variables. The percentage of variance of the dependent variable explained by the regression line is 0.482. The value of the coefficient is not particularly high and therefore the adjustment of the regression model to the sample data is not very good.

Table 5. Descriptive statistics for P/E index**Explore****Case Processing Summary**

	Cases					
	Valid		Missing		Total	
	N	Percent	N	Percent	N	Percent
Price_to_Earnings	44	100,0%	0	0,0%	44	100,0%

5.2 Effect of technological innovation on stock valuation

The test of the impact of technological innovation on stock exchange valuation of companies will use as an independent variable the annual percentage change in R & D expenditure and as a dependent P/E ratio calculated for all companies.

The test of the data on the percentage change in annual R & D expenditure is the same as in the previous case and according to boxplot remark 17 concerning AbbVie Inc. is considered extreme and can be safely removed in order for the model to better describe the rest of the data.

Then the test for the data of the dependent variable, i.e. the calculated values of the P/E index, performed, with the following results showed in table 5 and graphs 19, 20, 21, 22.

Graph 19. Boxplot about price to earning index for companies with R&D expenses

According to the boxplot (graph 19), observation 41 from the P/E data for Intuitive Surgical Inc. it is extreme and can safely be removed. In addition, observations 14 and 21 concerning Netflix Inc. are considered as outliers and Adobe Systems Inc. and can also be removed, in order for the model to better describe the rest of the data.

Graph 20. Normal P-P Plot of regression standardized residual for price to earnings

Normal P-P Plot of Regression Standardized Residual

**Graph 21.** Scatterplot for dependent variable: price to earnings

Graph 22. Linear regression for price to earnings and R&D expenses percent change

The results show that the distribution of the residues follows the normal distribution and the dispersion pattern is randomly scattered. Therefore, there are appropriate conditions to apply linear regression. The percentage annual change in the costs spent on research and development has a positive but very weak correlation with the value of the P/E index. As can be seen (graph 22), the estimated linear regression model is expressed by $Y = 6.51 + 5.06 X$. This means that when the annual costs spent on research and development increase by 1%, it is expected that the P/E ratio will increase

by 5.06 points. The Pearson linear correlation coefficient is $R = 0.265$ and shows that there is a low correlation of the two variables. The variance of the dependent variable explained by the regression line is 0.070. The value of the coefficient is very low and therefore the adjustment of the regression model to the sample data is not at all good.

	Firms_without_RandD	,0133928

5.3 Examining two hypothesis of section 3

Now, the two hypotheses mentioned in section 3 will be tested through the SPSS statistical packet. To do this, companies divided into two groups. The first group includes the 44 companies that invest in the innovative actions, while the second group includes the remaining 55 companies that do not have such investments at their expenses. Both statistical tests performed at a 95% significance level, which is generally accepted (Hanneman et al., 2013).

The first test concerns the control of the percentage change in the sales of the companies between the two groups. The zero and the alternative hypotheses can be formulated as follows:

H_0 : The average percentage change in sales of companies investing in innovative actions is equal to the average of companies that do not invest in innovative actions.

H_1 : The average percentage change in sales of companies investing in innovative actions is higher than the average of companies that do not invest in innovative actions.

Results from the test are shown in table 6.

Both groups contain a few companies, but the sample is not considered small, since it is more than 30.

Statistical test is one-sided, since the alternative case requires that the average percentage change in

sales of the companies in one group be higher than the corresponding average of the other group. In the SPSS Independent Samples Test table, and specifically in the Sig. (2-tailed) of the t-test for Equality of Means, the value of the p-value is 0.067.

However, since this value concerns bilateral control, while the purpose of this study is for one-sided control, the final value is half that. Therefore, p-value = 0.0335 and if it is less than the critical threshold of 0.05 valid for the 95% significance level selected, the zero hypothesis H_0 can be rejected and the alternative hypothesis H_1 can be accepted. Thus, it is concluded that, the average percentage change in sales of companies investing in innovative actions is higher than the average of companies that do not invest in innovative actions.

The second test concerns the percentage change in the stock exchange value of the companies between the two groups. The zero and the alternative hypotheses can be formulated as follows:

H_0 : The average percentage change in the stock market value of companies investing in innovative actions is equal to the average of companies that do not invest in innovative actions.

H_1 : The average percentage change in the stock market value of companies investing in innovative actions is higher than the average of companies not investing in innovative actions.

Results from the test are shown in table 7.

	Firms_without_RandD	,0322651

Independent Samples Test

		Levene's Test for Equality of Variances		t-test for Equality of
		F	Sig.	t
Capitalization_percent_change	Equal variances assumed	1,415	,237	1,118
	Equal variances not assumed			1,109

Independent Samples Test

		t-test for Equality of Means		
		df	Sig. (2-tailed)	Mean Difference
Capitalization_percent_change	Equal variances assumed	97	,266	,0561745
	Equal variances not assumed	88,765	,271	,0561745

Independent Samples Test

		t-test for Equality of Means		
		Std. Error Difference	95% Confidence Interval of the Difference	
			Lower	Upper
Capitalization_percent_change	Equal variances assumed	,0502236	-,0435054	,1558545
	Equal variances not assumed	,0506756	-,0445204	,1568695

Statistical test is one-sided, as the alternative test requires that the average percentage change in the stock market value of the companies in one group be greater than the corresponding average of the other group. In the SPSS Independent Samples Test table, and specifically in the Sig. (2-tailed) of the t-test for Equality of Means, the value of the p-value is 0.266. However, since this value concerns bilateral control, while the interest of the survey is for one-sided control, the final value is half that.

Therefore, p-value = 0.133, which is greater than the critical threshold of 0.05 for the 95% significance level selected and therefore there is not enough evidence to reject the zero hypothesis H_0 . Thus, it is concluded that, the average percentage change in the stock market value of the companies investing in innovative actions is equal to the average of the companies that do not invest in innovative actions.

6. CONCLUSIONS

The purpose of this study is, with the help of the linear regression method, to investigate the impact of innovation actions on the economic results of companies and on their stock market valuation. Data gathering of the financial statements from the Securities and Exchange Commission's website (www.sec.gov) gave validity to the results, while the use of the SPSS statistical package facilitated the analysis of the data.

Concerning the impact of innovation on the economic performance of companies, results of this study confirm the disagreement between the findings of the existing studies that were observed during the bibliographic review. No very strong linear correlation was observed between the variables, nor was a very low one.

On the contrary, the data show that there is a moderate positive linear correlation between the change in costs in innovation actions and the change in sales and gross profits. This means that sales and gross profits are affected by the change in research and development costs, but not to a large extent. They seem to be influenced perhaps by the other dimensions of innovation or other parameters apart from the costs of innovation actions, but research is not the purpose of this study.

Perhaps the most important finding of this study was the hypothesis testing between the average percentage change in sales of companies investing in innovative actions and those of companies that do not invest in innovative actions. It has been shown that companies investing in R & D have, on average, higher sales growth and this is a very important element to be taken into account by all companies. This seems to be fully confirmed by the first hypothesis made after the review of the literature.

The correlation between R & D expenditure and sales and gross profits is higher and with net profits less. This observation is directly related to the effectiveness of innovation. An innovative action is considered effective when the costs spent on developing this innovative action are less than the net revenue it earns in the company.

So some companies are more effective in integrating innovation, and R & D spending is expressed with increased sales and net profits while others have increased sales but without them being expressed into an increase in net profits. As the main goal of most companies is profit, it is important that companies focus on how innovative actions can be effectively integrated.

Regarding the impact of innovation on financial valuation, no linear correlation was found between the change in costs in innovation actions and the stock valuation as expressed by the P/E index. The low factor determines that stock valuation by investors is more dependent on other factors than on the costs that companies spend on research and development. The macroeconomic

environment and the creditworthiness of companies are perhaps some of the factors that most affect the investors' sentiment in buying and selling shares in the financial markets.

Similarly from the second hypothesis test, it appears again that investment in R & D does not affect the share price of companies or investors' decisions. The average percentage change in the stock market value does not show a statistically significant difference between the two groups and as a result the second hypothesis of the present study is not confirmed.

Of course, there is always the possibility that the two variables do not have a linear correlation, but some other kind, such as a logarithmic or polynomial correlation. R & D expenditure as a percentage of sales and the P/E, appears that there is a positive correlation at the beginning but, after a critical threshold, it appears to have a negative correlation that may be approximated by a polynomial equation.

It seems that when R & D expenditure reflects a small to moderate percentage of sales, it is positively perceived by investors and the P / E index and stock valuation increases, and when this percentage grows, investors may think that the company follows risk strategy and the P/E ratio is decreasing.

In our study there are limitations. The first limitation concerned the sample size. Although the sample number was not small, it would be preferable to apply it to a larger number of companies, from different countries, with a sectoral breakdown. Another limitation was the fact that data was collected for only two years, and the collection of data over a long period would again increase the observations of the survey.

As a final conclusion, considering the dimensions of innovation mentioned in the bibliographic review by Katimertzopoulos and Vlado (2017), this paper focuses more on the impact of the technological dimension. According to the results of research questions and assumptions, the technological dimension of innovation, as expressed by R & D costs, affects to a small extent the financial results and a much smaller stock valuation of the companies.

COST-STRUCTURE AND THE VOLATILITY OF CAPITALISM

Philipson, Sarah

University of Gävle, affiliated with Linnaeus University, Sweden

ABSTRACT

This conceptual paper explores the phenomena of changing cost-structures and the implications for the volatility of capitalism and the possibility to manage firms in such a hostile environment and proposes future research. It also provides an explanation of why the relevance of accounting is lost, the so-called "relevance lost" debate (see among others Francis & Schipper, 1999).

The changing *cost-structures* raises fundamental questions concerning the resulting *the volatility of capitalism* and *the management of firms in such an increasingly more volatile environment*. In Philipson, Johansson & Scheley (2016), we raised the question if it was possible to "...to ride the dragon." Considering the importance of these phenomena, it is astonishing that we have not found any empirical research concerning them. They rest research questions, based on the author's almost 25 years of experience, as a senior executive in Scandinavian industry.

Keywords: Cost-structure, volatility, risk

INTRODUCTION

Increased competition and, as a consequence, diminishing life cycles, have made differentiation strategies more important than economics of scale or cost leadership. "*Competition has a large effect in shortening the longevity of products on the market.*" (De Figueiredo & Kyle, 2006:258) This is reflected in the shift in focus from Porter (1980) and Porter (1996), and is underscored by (Raia, 1993, after Wagner & Busse, 2008), who have shown that 60-70% of life cycle profits result from decisions before the offering is even launched.

After WWII a typical product life cycle was 20 years. In the 1980s it has been reduced to 7-8 years and today it is typically 3-5 years, with:

- (1) individual products having life cycles of 3 - 6 months (e.g. mobile telephones).
- (2) These individual products might reside within a technology with longer life cycles (e.g. 7 - 10 years as the 4G mobile telephone systems) and the
- (3) very concept of a technology as such (the mobile phone is 66 years old now).

SHORTER PRODUCT LIFE CYCLES

The average product life cycle has been declining, ever since the capitalist system was born.

Figure 1 shows a typical product life cycle with an investment phase (the curve below the 0 cash flow line) and exploitation phase with revenues incoming (the positive cash flow curve). When the product is a technology, e.g. 4 G, individual products have their life cycles within the technology life cycle.

Figure 1. Life cycles within life cycles, own.

Products do not last forever; they are developed, launched onto the market, grow, and eventually decline and die as they are finally supplanted by new or substitute products. The average product life cycle has been declining, ever since the capitalist system was born.

Shorter life cycles (Rink & Swan, 1979; Young, 1964, after Qualls, Olshavsky & Michaels, 1981; Olshavsky, 1980), result from increased competition. In the 19th century it was not unusual that a product to last for a century. The common claim of shorter life cycles has seldom been *empirically* verified, and the above studies are all problematic. But Magnier, Kalaitzandonakes & Miller (2010) provide such empirical evidence for a 12-year period in the US corn hybrid industry.

"...corn hybrids with more advanced biotech features tend to have shorter product life cycles."
(Magnier et al. (2010:33).

Increased competition and, as a consequence, diminishing life cycles, have made differentiation strategies more important than economics of scale or cost leadership. "Competition has a large effect in shortening the longevity of products on the market." (De Figueiredo & Kyle, 2006:258) This is reflected in the shift in focus from Porter's 1980 book to his 1996 article, and is underscored by (Raia, 1993, after Wagner & Busse, 2008), who have shown that 60-70% of life cycle profits result from decisions before the offering is even launched.

The consequences of shortened life cycles are the increased importance of the development of new offerings and hence differentiation and the importance of intellectual property rights, as well as other strategies to increase temporal monopoly (short-term uniqueness) has increased) (von Hippel, 1988).

At the end of the 19th century the life cycles of products (services or experiences) were 50-100 years. Innovation was not a big issue. Product life cycles have become much shorter. After WWII a typical product life cycle was 20 years. In the 1980s it has been reduced to 7-8 years and today it is typically 3-

5 years, with (1) individual products having life cycles of 3 - 6 months (e.g. mobile telephones). These individual products might reside within (2) a technology with longer life cycles (e.g. 7 - 10 years as the 4G mobile telephone systems) and the very (3) concept of a technology as such (the mobile phone is 66 years old now).

The "...shortening life cycles of new products. In the computer industry during the early 1980s, for example, hard disk drives would typically ship for four to six years, after which a new and better product became available. By the late 1980s, the expected shipping life had fallen to two to three years. By the 1990s, it was just six to nine months." (Chesbrough, 2007:24).

However, in mature industries that have not yet suffered from substitution competition, the life cycles are still long.

Hundred years ago, only 1-2% of the turnover of the firm was at stake each year, while today it is one third! To replace lost business, to retain the same size of the company, the 1900 firm had to launch products that could replace 2% of its business each year. Hence, 12.5% new products had to be successfully launched each year. Today, with an average life cycle of 3 years, one third of the business is up for auction every year. With a failure rate of innovations of at least 100% (Evanschinsky, Eisend, Calantone & Jiang, 2012; Van der Panne, van Beers & Kleinknecht, 2003), and a needed 10% yearly growth, it is clear that managers of highly successful companies do not necessarily know if the firm will exist at the end of the year! Since innovation is risky, the firm might need a product development portfolio that is as large as the current turnover, or even more! (Van der Panne et al., 2003).

Table 1 shows the percentage of a firm's turnover that has to be renewed each year and the consequences in the form of the size of the product development portfolio that is needed.

	1890	1950	1980	2005
Average life cycle	50 – 100 years	20 years	7 years	3 – 5 years
% of turnover at stake	1 – 2%	5 %	15 %	30 %
Necessary Innovation portfolio	2 – 4%	10 %	30 %	60 %
Portfolio with growth	2 – 4%	11 %	33 %	66 %

Table 1. The volatility of capitalism, Philipson et al. (2016).

These shortening life cycles have consequences for *the cost structure* of products and hence for how firms make business.

COST STRUCTURE

The cost structure of a typical company in 1900 could look as is shown in Figure 1.

Figure 2. The cost structure of a company in 1900, own.

In the following 50 years it only marginally changed. Management attention and a new science of management had evolved and focused on *diminishing the direct labour costs*, by introducing *mean time measurement* (MTM) and *variable salaries*. These managerial strategies of course go back to Taylor (1911/2001) but were widely employed only after the second world war; a consequence of the arrested development of capitalism as a result of the two world wars.

Figure 3. Cost structure in 1950 compared to the cost structure in 1900, own

In 1965, the efforts to diminish direct Labour costs had resulted in radically increased *costs of bought material* and hence, management attention and academic research focused on *Just-in-Time*, JIT, *capital rationalization*, and other means to beat down the costs of bought material. These practices were typically subject to academic research a decade later (Aglietta, 1979; Palloix, 1976, both after Sayer, 1986).

Figure 4. Cost structure in 1965 compared to those of 1950, and 1900, own.

By 1985 the new engineers that had been employed to work with the new management techniques had become Mintzberg’s technostructure, Mintzberg (1979), or *overhead costs* had become important enough to become the center of attention (see Johnson & Loewe, 1987).

In 1982 the author slashed down central staff and services at the then Asea Brown Boveri (ABB) headquarters in Västerås, Sweden....

Figure 5. Cost structure in 1985 compared to those of 1965, 1950, and 1900, own.

In 2000 the cost structure had again radically changed. Increased competition had made *innovation* and the costs of *global niche marketing* the dominant elements and the center of attention.

In Figure 6 the *business risk costs*, innovation, organizing the value chain, and fixed marketing costs are identified as the lion’s share of the cost structure.

Figure 6. Cost structure in 2000 compared to those of 1985, 1965, 1950, and 1900, own.

Figure 7. The Cost structure in 2000, own.

Products like personal computers and mobile telephones has a variable production cost of 10-15%, a Lacoste t-shirt 8%; a music CD 2%. Most of the costs are fixed production and marketing costs, paid upfront before any revenues can be collected. All these costs are risked in advance of not only any revenues, but even of any industrial production. A failed investment in innovation means that all the costs are sunk. Lost. Capitalism as we know it has become very risky. But still, some of the most successful firms do it. Why?

The fixed costs the are risked include:

- 'Pure' product development, R&D, development of the product or service architecture, interfaces between components, standards (proprietary or open).
- Fixed production costs, certain parts of production costs have to be taken before any product is sold, be it setting up plants, buying machines, and for developing machine tools.
- Fixed marketing costs, the production of marketing, buying 'space', etc., in order to be able to roll out the marketing when the 'window' of opportunity opens.
- Organizing the value chain.

SOCIETAL CONSEQUENCES

These changing cost structures also has societal consequences. The typical firm of the year 2000 is very different from that of 1900, see figure 8. As a consequence, society is very different. In 1900 the class distinctions and living conditions were sharply different between on the one hand the owner-capitalist

and the contre-maître (production director) and on the other the rest of the employees. In 2000 the spread in living conditions can be as large or larger, but the employees are “all over the place”, not at the other end of the spectrum.

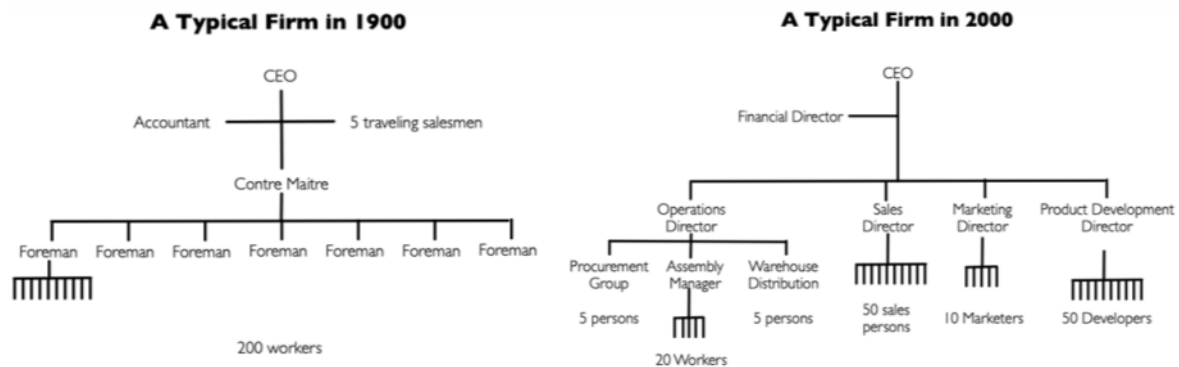

Figure 8. A typical firm 1900 and in 2000, own

There are three major reasons why firms develop new offerings:

1. To replace products that are no longer competitive.
Customers' needs evolve. If the company does not adapt competitors will. Hence, companies have to develop their offerings to meet competition or, if they fail to do so must develop new offerings to compensate for the loss of those. Offerings hence have a “life cycle”; they will not last forever.
2. To grow. If the company want to grow, it must add new offerings or increase market share for existing offerings.
3. To gain (temporary) monopoly rent, abnormal earnings.

CONCLUSIONS

The changing *cost-structures* raises fundamental question concerning resulting *the volatility of capitalism* and *the management of firms in such an increasingly more volatile environment*. In Philipson et al. (2016), we raised the question if it was possible to ride the dragon. Considering the importance of these phenomena, it is astonishing that we have not found any empirical research concerning them. They rest hypotheses, based on the author's almost 25 years of experience, as a senior executive in Scandinavian industry

PROPOSED FUTURE RESEARCH

1. Longitudinal case study of a product cost structure based on internal company archive.
2. Longitudinal study of variable costs as a percentage of corporate annual returns of listed companies and if identified *business risks* are compensated by lower *financial risks*, increased solidity, to balance the total risk.

CONSUMERS AND ENTERPRISES AS ACTORS ON THE MARKET

Philipson, S.

University of Gävle, Sweden and Linnaeus University, Sweden

ABSTRACT

This conceptual paper discusses the phenomenon of differentiation made possible through branding or innovation or a combination of the two. Differentiation is eventually the driving force for the development of its own negation, commoditization. When customers have endured a commoditized market long enough the opportunities open up for creative destruction, this concept of Schumpeter (1942), means that an entrepreneur invents a completely new way of satisfying the customers' unsatisfied needs, making the industry that no longer bothered about their customers. Many researchers have tried to re/brand destructive innovation as their own, with concepts, such as of "transilience", and "blue ocean strategy", as opposed to 'red ocean strategy'.

The paper focuses on innovation as a differentiation strategy and on temporary monopoly rent as a driver of innovation. Increased competition and shortening and life cycles makes capitalism more volatile and the strategies to reduce the risks involved are discussed. These strategies lead to the real-world implementation of the concentration of capital forecasted by Marx and feared by Schumpeter.

The paper identifies the need to continuously monitor the concentration of capital and to understand individual markets by studying the firm's profit.

Keywords: Market, differentiation, commoditization, innovation, creative destruction, monopoly rent, organic composition of capital, volatility, concentration of capital.

INTRODUCTION

The concept "market" is central in marketing, but we are often sloppy in defining it and explain the mechanisms regulating markets. Sometimes we use the concept of "market forces" (a legacy from economics), but of what does these forces consist and how can we understand these. Different traditions in marketing rely on different perspectives on how to view the market and the mechanisms regulating it.

First, we give an example, *Wine making in France*, of how undifferentiated products can be differentiated. Then under *Competition and differentiation* we discuss how competition forces companies in general to differentiate their products and services, to reach higher profits. Neo-classical

and classical economy's view on these issues are discussed and the reasons why marketing is fundamentally classical in its foundations. There are *two ways to differentiate products*, **Innovation** and **Branding**. Here we are showing what they achieve for companies in the form of differentiation. Under **Innovation and Monopoly Rent**, we discuss the extra-ordinary profit levels that can be achieved by successful radical innovation. The risks inherent in investing in differentiation leads to increasing volatility are discussed under **The volatility risks and the management of these**. Under the header **Commoditization and creative destruction**, we show how markets mature from competition and enter into a phase of slow change that eventually ends in what is called **Creative destruction**, when the industry is over-run by a newly arising industry.

Commodities, undifferentiated homogeneous goods, satisfy basic human needs; be it a kilo of rice or potatoes to eat, or pine planks to build a house. But most needs are different for different customers, hence if we address these specific needs, we produce products and services which are differentiated, heterogeneous. Differentiation means that the product satisfies the need differently, through innovation, or better, because of quality. The firm that manages to produce such added value and communicate the extra value to customers reap higher profits in the market place.

WINE-MAKING IN FRANCE

In the 1960s, when I first visited Paris, most people brought their own bottle to the local food retailer and refilled in from a tap, almost as in a gas station. Wine was a commodity, not a differentiated product, and as such quite bad one, also in France.

Although wine making has a history going back more than a couple of thousand years, there were no possibility for customers, apart from a select few of the upper classes, to distinguish the hundred thousand wine peasants that produced wine, and hence buy it because of its quality. The select few, like the most prestigious vineyard in France, Domaine de la Romanée-Conti that goes back to 1232, had the royalty and the noblesse as customers.

In 1742 the first attempt to differentiate the vineyards was in Bordeaux, but it was not until 1855 that an official classification system of Bordeaux wine was made. The same year Burgundy got its first unofficial system, but it was not until 1936 that an official system was introduced. What the "appellation contrôlée"-system did was to classify the land, based on soil type, sun exposition, minerals, and water flow, which together with the climate during the year, give the *conditions* for wine making. The quality of the wine is primarily the result of the wine-makers efforts and the classification tells nothing about that. But the identification of the land made it meaningful for the wine maker to invest in quality, as the vineyard could be identified.

In the two villages Chassagne-Montrachet and Puligny-Montrachet in the lower central area of Burgundy, there are some 500 ha of land with wine, of which slightly more than 30 ha have the highest classification of "grand Cru". Of four grand Cru wines, the best the Montrachet, is the best dry white wine in the world. It is produced on less than 8 ha of land and subdivided in lots owned by 26 producers (2007). On a global market with 26 producers it is possible to differentiate yourself by outstanding quality.

Hence, the region in which the wine is produced tells something about the quality of the wine. The region labelled on the wine bottle signaling this quality. Thus, the wine becomes differentiated into different brands (vineyards), vintages (quality indicator) and regions (quality indicator). Other commodities have become differentiated in this way, especially food products from the agricultural sector, e.g. cheese, meat, etc.

COMPETITION AND DIFFERENTIATION

Markets as we know them are a consequence of industrialization and the capitalistic economic system that replaced the feudalism of the middle ages. The peasant produced either for the nobleman or for his own family, never for a market. The independent artisan did exchange the results of his work for money, but not with the aim to produce profit, just to support the family on a socially acceptable level (Marx, 1867/1970).

For the modern version of the artisan, be it a shoe-repairer or an owner of a taxi, the firm is also a basis of survival, rather than to produce profit and expand. In a favorable business cycle the company might expand slightly, with one or a few employees, and then contract in a less favorable one. In the slow cycle, the owner's hours of work could expand to 12 hours and in a good cycle diminish to 8 hours. Chayanov (1925/1966) explained the regulating mechanisms in these enterprises to be a socially acceptable subsistence level for the family. This type of companies can exist in sectors of the market characterized by a fragmented economy, no actor is able to differentiate to make substantial profits and outcompete others.

With industrialization markets evolved and companies sold goods for profit. The aim of the company was not to produce goods, but to produce profit. This was not without risk and the profit had to be on certain level to motivate the risk-taking involved. Over business cycles the *average profit* level has been some 5% over bank interest (cf. Nicholas, 2003:1045)), giving an average *interest* of around 2%.

Neo-classical economics presumes that markets are characterized by perfect competition, where no individual or buyer can affect price, i.e. only undifferentiated goods are exchanged on the market. Hence, all companies create average profit. But companies and business administration as their help

science, strives to get more profit, not only in absolute figures by growing, but relatively, as a percentage of the company equity, by differentiating products and services.

Classical economics (Smith, 1776/982; Malthus, 1798/1970; Ricardo, 1817/1971; Marx 1894/1970; and others) understood that there is a drive among capitalists to get more than the average profit. They recognized this as *monopoly rent*, a premium for being different, which meant that profits were re-distributed in the market place to the advantage of the company with a unique, and especially the most unique product. To begin this was supposed to be because of monopoly control of natural resources. Ricardo is credited with the clearest analysis of land rent. Marx (1894/1970; 1973) used Ricardo's concept for land rent, but for industrial capitalism. He introduced the concept of redistribution of profits by the organic composition of capital, a measure for how advanced the capital is in employing science and technology. Schumpeter (1942, 1947) used the term monopoly rent in a sense akin to Marx' concept, to explain the "long waves" of capitalism and fundamental effects of entrepreneurial "destructive changes"; when market conditions are fundamentally changed by the innovations of "entrepreneurs" (cf. Elliott, 1980). The entrepreneur gains a temporary monopoly rent by being unique (von Hippel, 1988).

This can be illustrated by the monopoly rent that Apple was able to gain by the introduction of the iPhone in mid 2007, illustrated in figure 1. In 2006, Nokia catches 60% of the profits in the market for mobile telephone terminals. Four years later, Apple had 75% of the profits and Nokia zero. Two years later Nokia, the monopolist six year earlier, had been forced out of the market.

Figure 1. Profits in the Mobile Phone Vendor Market, Asymco (2013-06-28), with permission

In spite of what is commonly thought, given the increasing Android sales, Apple has increased its dominance, see Figure 2. The figure shows that in 2016, Apple took 92% of the profits in the market, although Samsung is the leader in terms of market share but does not earn any money! Google is the profit leader for operating systems (Android), but that does not trickle down to its partners using that operating system. Hence, even if a company has a smaller market share it can catch the lion's share of the profit, because of the monopoly rent gained by differentiation. This also illustrates the important difference between market share, share of total sales in industry, and profit share, share of the total profits industry. The market share does not tell who the industry leader is.

Global Smartphone Profit by Vendor	Operating Profit (US\$, Billions)	Operating Profit Share (%)
Apple	\$8.5	91.0%
Huawei	\$0.2	2.4%
Vivo	\$0.2	2.2%
OPPO	\$0.2	2.2%
Others	\$0.2	2.2%
Total	\$9.4	100.0%

Figure 2. Global Smartphone Operating Profit Share in Q3 2016, Strategic Analytics (2016-11-25).

Another example is Digital Equipment that in 1986 was number two in the computer market (after IBM), 9 years later it did not exist anymore (Spencer, Kirchhoff & White, 2008).

TWO ELEMENTS OF DIFFERENTIATION

Branding and innovation are two independent, but related elements of differentiation. As indicated by our narrative about French wine making, differentiation by branding is antecedent to exploiting the results of investing in innovation or quality. *Branding* is a differentiating phenomenon, which is promising quality.

"Firms with strong brands... tend to introduce fewer products and keep those products on their market longer than their weak-brand counterparts." (De Figueiredo & Kyle, 2006:242).

Firms with strong brands, measured by having high brand equity can capture higher price premiums on brand extensions into nearby product classes than firms without strong brands. (De Figueiredo & Kyle, 2006).

Unless customers can identify the innovator, the investments in innovation are unfruitful.

INNOVATION AND MONOPOLY RENT

Innovation makes it possible to reach Abnormal Earnings, AE, during the time that the innovation has not been imitated by competitors. Monopoly rent was used by Malthus (1798/1970), Ricardo (1817/1971), and Marx (1894/1970) to explain land rent and then other monopoly rents. Marx (1894/1970) explained AE as the result of the re-distribution of profit in relation to the organic composition of capital. In this he was a forerunner of the resource-based view (Penrose, 1959/2009), in that it that he focused on the technical resources and the more advanced capabilities of the company reaping monopoly rent. Schumpeter (1942; 1947) applied monopoly rent to innovation, to explain how a temporary monopoly gives the innovating firm a competitive advantage.

“Schumpeter argued that those who succeed at innovating are rewarded by having temporary monopoly control over what they have created. This control, in turn, is the lever that allows innovators to gain an enhanced position in the market and related temporary profits of “economic rents” from their innovations.” (von Hippel, 1988:43, 58).

In accounting literature AE is normally measured by the neo-classic Ohlson model (AbuGhazaleh, Al-Hares & Haddad, 2012; Bernard, 1995; Feltham & Ohlson, 1995; Lo & Lys, 2000; Lundholm, 1995, after Lundholm, 2014; Ohlson, 1995), which calculates the value of the firm as the net present value of future abnormal earnings. The Ohlson model updated the Gordon model (Gordon & Shapiro, 1956) with the Miller & Modigliani model (Miller & Modigliani, 1961).

“Abnormal earnings bear on the difference between market and book values, that is, they bear on a firm’s goodwill.” Ohlson (1995:662).

However, that the model recognizes abnormal earnings is in fundamental conflict with neo-classic economic theory, as it abstracts from the fundamental assumption of perfect markets. The Ohlson model is one of the most cited and respected models in the accounting literature, but it has one major flaw: although it is an empirically well-validated prediction model, it fails to explain why these abnormal earnings exist. Classical economics gives such a fundamental explanation. (Philipson, Johansson & Schley, 2016).

The result of monopoly rent, or abnormal earnings, is rapid, unforeseen changes. In mid-2007 Nokia retained 60% of the profits in the mobile phone vendor market. Then Apple introduced the iPhone. Four years later, Apple had 75% of the profits and Nokia zero! In 2013 Nokia ceased as an independent mobile phone manufacturer. In 2016, Microsoft that had bought Nokia, announced that it would close the mobile phone business (although it later emerged as a low-cost phone essentially for emerging markets). From being the leading and dominant player, it was forced out of the market in 6 years.

"...it can always be understood ex post; but it can practically never be understood ex ante...",
Schumpeter (1947:150).

Apple has over the last 15 years managed to have a profit level of around 25%, which is some 18% more than the average profit level.

Figure 3. Profit level, own.

Figure 3 shows the profit level in different types of markets: family economy (subsistence companies), with 0-2% profit, bank interest, 2%, normal or average profit in competitive markets (perfect competition), 5-7%, monopolistic competition, and monopoly, 25%.

We have at length discussed differentiation and the monopoly rent that can become the result of such differentiation. The monopoly rent is however temporal. Sooner or later competitors will catch up with the monopolist by launching similar or equivalent products. This will start a process of commoditization; the downward slope of the bell-curve in figure 3, increasing price competition, mergers and acquisitions, eventually reaching a monopoly based on cost-effectiveness.

Then there are no incentives for innovation. Customers will become dissatisfied as the product does not adapt to evolving needs. Then the industry is ripe for destruction by a new creative destruction. Eventually this will also happen to Apple, even though it now has the dominant market share. As we showed this was what happened to Nokia.

VOLATILITY RISKS AND THE MANAGEMENT OF THESE

Capitalism becomes more and more volatile, because the increasing volatility associated with innovation and shorter life cycles (Philipson, 2019) We have now seen the mechanisms behind this spur of innovation and consequent short life cycles.

Destructive innovation covers the following five cases (Schumpeter, 1934:66, after Baumol, 1996):

- (1) *The introduction of a new offering* is one with which consumers are not yet familiar – or of a new quality of an offering.
- (2) *The introduction of a new method of production*, one not yet tested by experience in the industry. It might not be founded upon a new scientific discovery and can also exist in a new way of managing the offering commercially.
- (3) *The opening of a new market* – a market in which the offering does not exist presently.
- (4) *The conquest of a new source of supply of raw materials or components* – irrespective of whether this source already exists or whether it has first to be created.
- (5) *The carrying out of the new organization of an industry* – the creation of a monopoly position (for example through trustification) or the breaking up of a monopoly position.

The involved risks are managed on an ever-increasing scale, by:

- *An assortment of products* (shown by Carlin, Haskel & Seabright, 2001:70ff), Branding “...platforms have greater staying power on the market than the individual products.” (De Figueiredo & Kyle, 2006:261). Such an assortment of products means that the company can balance the risks of each individual product. If the assortment is well construed, the products does not contain the same risks.
- Several *plants* with different effectiveness (shown by Carlin, Haskel & Seabright, 2001:70ff), “...a capacity of multi-plant firms to manage the uncertainty of the market environment better than do single plant firms.” (Carlin et al., 2001:82). Workers in Sweden are normally more educated than workers in emerging markets, but their salaries are much higher. Hence, products and components with a high value-added are often produced in plants in Sweden and cost-sensitive products in emerging market countries. Short series are often produced near the selling market, because the company usually has to adopt quickly to changing demand.
- The presence in different **nations**, with different political risks (Gupta, 2013). Many emerging markets involve political risks, such as a military coup d’état in Thailand, social unrest, unclear legal conditions, etc.,
- By organized *long-term supply-chain cooperation*. “To find the balance point between imposing and meeting requirements in dialogue with vendors.” (Kjellström, 2019) [emphasis in original]; the supply-chain cooperation allowing a ‘dumper effect’ of volatile demand, by allowing the end-manufacturer to reduce or increase the amounts bought from co-operating suppliers as a function the evolution of market demand, and finally

- A presence in several *industries*, reducing the risk of creative destruction (Philipson & Oghazi, 2013). This is what corporations do and which eventually leads to the concentration of capital, see below

The concentration of capital

These increasing risks are ultimately managed by the concentration of capital. This is one of the most important tendencies in capitalism, as suggested by Marx (1894/1970; 1973).

“Schumpeter’s great fear was that large firms would come to dominate the innovation process through economies of scale and control of resources (Schumpeter, 1942). This, in turn, would lead to the concentration of wealth in the hands of a few large corporations, and necessitate a transition to socialism.” (Spencer & Kirchhoff, 2006:153).

Studying the period between 1890 to 1910, Austrian economist Rudolf Hilferding (1919/2007), German minister of finance 1923 and 1928-29, called this financial capital, i.e. financial corporations owning many businesses, thus balancing off the risks.

Glattfelder (2010) showed that this concentration has now proceeded to such heights that 50 corporations’ control 40% of the global wealth. It shows that although the same risk management effects can be achieved by all types of corporate experience with generalized capital functions (Philipson, 1980; Philipson & Oghazi, 2013), 29 of the 50 corporations are still financial corporations.

A recent study shows an even higher concentration in the US: BlackRock, Vanguard, and State Street (assets management companies) are together the largest shareholder in 88 percent of the S&P 500 firms. (Fichtner, Heemskerk & Garcia-Bernardo, 2017).

Hence, it is no question that Marx, Hilferding, and Schumpeter were right; the concentration of capital is today extreme; but we don’t know the consequences yet. All three of them saw this as a forerunner of socialism, whether with enthusiasm, Marx and Hilferding, or fear, Schumpeter.

COMMODITIZATION AND CREATIVE DESTRUCTION

Usually the eruptive innovator is imitated by others that want a share of the monopoly rent, or by lower quality brands that are “eating up” the uniqueness of quality brands, as can be seen in apparel branding over the last twenty years. If the innovator or brander does not manage to re-engineer its uniqueness, competition between the companies, producing the same quality for a lower cost, will increase and will eventually, over mergers and acquisitions, become an oligopoly or sometimes a monopoly, based on economics of scale. Often the new innovation must come “from outside” of the industry, as there are no longer any incentives to innovate. Thus, industries or business models have a lifecycle, whether it was department stores (150-200 years), landline telephones (125 years), or other industries.

Schumpeter's concept of creative destruction (1942) means that an innovation "changes the game", by launching an offering that makes an industry obsolete as a whole. Well-known examples are the mechanical calculator, which was replaced by the electronic calculator in just a few years and the mobile phone has globally replaced the land line, although that has been a much slower process.

"This is fundamentally different from general equilibrium theory, where competition is almost exclusively price-based. In Schumpeter's view, competition is not to be based solely on price – "the price variable is ousted from its dominant position" (Schumpeter, 1942:84) – but rather on non-price characteristics of a product such as capabilities and performance – shifting the basis of competition from the ability to minimize cost to the ability to innovate." (Spencer & Kirchhoff, 2006:147).

"...a firm's best – most loyal and most profitable – customers are the best precisely because they are heavily invested in the firm's current product offerings." (Christensen, 1997 after Spencer & Kirchhoff, 2006:150).

"...evolutionary technologies are driven often by customer demand for improvements of existing products; these improvements make products better without disturbing current customer behaviours. This type of innovation is often known as "demand-pull" innovation, because it is grounded in market research, identifying improvement desired by existing customers." (Spencer & Kirchhoff, 2006:151)

Other interpretations of creative destruction are the neo-classic economist Kirzner (1973, 1997), who based himself on Knight (1921), and Baumol (1993) (all after Spencer *et al.*, 2008:11-13). Abernathy & Clark (1985) tried to appropriate the concept with a new name 'transilience' but were not successful. Somewhat more successful in branding creative destruction as their own concept were Kim & Mauborgne, in rebranding it as "blue ocean strategy" as opposed to 'red ocean strategy', which take competition head on. These 'blue ocean' strategies are expected to give the company a higher monopoly rent and to be able to retain the temporary monopoly for a longer time. (Chan & Mauborgne, (2004, 2005a, 2005b; Kim & Mauborgne, 2005a, 2005b; Kaplan & Norton, 2008).

Sustainable creative destruction

Creative destruction must in the future encompass not only the industrialized countries but also the world's poor. If *the bottom of the pyramid* (Prahalad, 2011), the over four billion people, who live on less than \$2/day, shall be able to raise their living standards radically radical innovations must be made that can make products and services available to a fraction of present costs. Prahalad takes the examples of Tata's car for 2000 USD, cataract surgery for 50 USD, and mobile phone time for 0.01 USD per minute. By others this has been called frugal innovations (Zeschky, Widenmayer & Gassmann, 2011).

But these new products and services will create real creative destruction, when they are not only available to the Indian or Malawian poor, but also to the equally poor European Roma or the white poor in the US Appalachian Mountains. Poverty and riches are no longer properties of the developing and industrialized countries respectively, but both exist in parallel in all parts of the world.

It is often difficult to innovate for innovators that do not share the needs of the potential customers. Creative destruction for the bottom-of-the-pyramid is more likely to be made by people emerging from the bottom of the pyramid, than people coming out of the US ivy league schools.

CONCLUSIONS AND RESEARCH PROPOSALS

Markets are seldom as suggested by neo-classical economists. The strive for monopoly rent and the consequential volatility of markets, the real *anarchy* of the market, forces solutions of managing the volatility. The concentration of capital, as forecasted by Marx, Hilferding, and Schumpeter is already extreme. It represents an unforeseen *planning* on the level of capital. Will this concentration continue? *The concentration of capital must be continuously monitored by research.* Will popular demand put limit on this concentration, or will popular influence on the future (democracy) be completely replaced by the planning of a few corporate owners?

To understand the functioning of individual markets, *firm's profit share must be monitored*, not the simplistic analysis of market share, which neither tells anything about real market leadership, nor about how the market functions.

DATA COLLECTION FOR A PERFORMANCE ANALYSIS ON WORKING CAPITAL MANAGEMENT

Remondino, Marco¹; Schiesari, Roberto²

¹Dept. of Economics, University of Genova, DIEC, Genova, Italy

²Dept. of Management, University of Turin, Turin, Italy

ABSTRACT

The objective of the present work is to develop and set up a model for assessing how working capital management can influence performance in small and medium-sized enterprises (SMEs). With this aim, the initial part provides a literature review, with the goal of identifying the problem and all its components. The concept of optimization of working capital and its influence on company performance is then discussed. The main part of the work concerns the collection of data about small enterprises, which will be the sample for the analysis that will be carried on in a subsequent research work. In this paper we discuss the industrial sectors of the companies used as a sample and the method of data extraction, as well as the construction of two sets of variables: the first set containing the symptomatic indicators of the management of net working capital and the second set comprising the profitability indicators, to measure the company's performance.

Keywords: working capital, management, enterprise performance, value creation, data analysis, data collection, AIDA.

INTRODUCTION

The objective of this work is to collect data in order to verify if there is a link between a correct management of working capital and the profitability of the company. This concept, which instinctively seems obvious, since any optimization should result in better performance, has not yet been the subject of analysis with regard to the sector of small-medium Italian companies. It was therefore considered important to check whether this relationship existed, given the importance of this type of company in Italy.

The collection includes Italian SMEs belonging to three different sectors of the food industry. In order to proceed with a meaningful analysis, it was considered appropriate to analyze, in addition to SMEs, large companies in each sector to use them as a benchmark and most sensitive variable, as it consists of a smaller number of companies, more solid and global and therefore less sensitive to the effects of the crisis. This was done considering that the time horizon had to be as close as possible to the present, and

therefore certainly including years in which the effects of the 2008 crisis and its consequences were an important exogenous factor that greatly influenced company performance and variables.

As stated, the area of investigation chosen is therefore Italian SMEs. According to the "User's Guide to the definition of SMEs" (European Commission 2015) in Europe in 2013 nine out of ten companies are an SME, amounting to more than 21 million. They have offered 88.8 million jobs, creating 2 out of 3 jobs. It follows that this type of enterprise and its mechanisms are very important to investigate, if for no other reason than the importance that comes from such a spread. The basic criteria for assessing whether an enterprise is an SME are clearly based on size. It is important to distinguish SMEs from other types of companies, because they face a number of problems related to market failures and structural barriers that lead them to need special assistance, provided in the form of EU programmes.

The report issued by Cerved on SMEs 2015 (Cerved 2015) notes that 137,046 companies in Italy meet these requirements and are therefore to be considered as SMEs. This number was fairly high in 2007, but has been reduced since the second half of 2008. More precisely, the number since 2007 has fallen by 13 thousand units, about 9% of the total number of SMEs active in that period, due to a collapse in demand and the credit crunch, which triggered a selection process, which meant that there was a distinction of the most robust companies. In 2015, for the first time, the decline in the number of active SMEs came to a halt and it can be seen that the companies that have remained are characterized by a particularly strong economic and financial structure. Even those that, despite the exogenous aspects of the period, have grown from, for example, micro to small enterprises, are on average more productive, more financially solid, less dependent on bank credit and more profitable than companies that have made the same transition in other periods of time.

Another factor to consider is the anomalous increase, but consistent with the general situation, of companies with at least one bankruptcy or liquidation procedure, as it is symptomatic of the difficulties of companies in a context of poor access to credit and tight competition on prices. Since 2008, the number of companies in bankruptcy or in serious difficulty has grown rapidly, with a peak during 2013, followed by a continuous decrease in 2014 and 2015, bringing the values back to those of late 2008 - early 2009.

This figure has a great influence on the analysis, since if a company is in a precarious situation, it is unlikely that, despite excellent management of working capital, it will be able to achieve good performance. The cluster of SMEs is therefore made up of very solid companies that have managed to grow despite the difficulties and that have remarkable results, and companies in crisis, in a much larger number than in the past, which instead lower the average for the sector and global. It is a decidedly heterogeneous whole, but it represents the majority of the Italian entrepreneurial activity, and therefore it is considered valid of an in-depth analysis.

There are many variables that can influence the profitability of the company. The most important is the trend of the economy, which affects all companies operating in the country. In order to assess the effects of the crisis on productivity at national level, data were extracted for a summary indicator, GDP, the value of which is issued quarterly by ISTAT.

GDP is a macroeconomic measure sensitive to changes in output and hence in demand at the national level. During 2008 there was a collective collapse at the level of the European Union, but it was recovered completely (or almost) in 2011 by the other countries, primarily by Germany.

On the contrary, the Italian situation is still very critical, as evidenced by the fact that GDP has not yet returned to pre-crisis levels, even though it shows a slight increase in the data for 2017.

Other elements to consider before proceeding with the analysis are the data relating to the differences in productivity trends based on the size of the company. It is important to underline the differences between large enterprises and SMEs, especially as both categories will be used in the analysis, one as a variable in question and one as a control variable.

Unhealthy production levels still returned to the levels of 2007, prior to the outbreak of the crisis, confirming the adequacy of macro data such as GDP to judge the performance of each size category. It is interesting, however, to evaluate how the category of medium-sized enterprises managed to exceed the 2007 standards in 2014, the only positive note of the data under examination. It can also be seen that the average values, regardless of the year, are much higher in large companies than in SMEs, with a difference of around 20,000 euros in value added per employee.

This difference is physiological, as large companies can benefit from economies of scale and have fewer barriers to entry, as well as greater production and distribution capacity. The figure becomes even more important if we consider that the number of employees in recent years has progressively decreased in the SME segment. This is probably due to both technological innovation and the continuous drive to reduce costs, whether fixed or variable. This trend has not been so strong in large enterprises and could lead to further discrepancies in the results of the two categories.

A final point that should be mentioned in relation to SMEs in recent years is the suffering. Although the impact of indebtedness has already been considered in terms of bankruptcies or liquidations, it does require further attention, as it is not certain that the presence of impaired debts of companies will only lead to such consequences. Even those companies that have managed to manage the situation and survive the crisis may have had difficulties leading to late payments, the need to restructure loan conditions (which has seen truly exceptional growth) or exposure overruns.

These figures, however, relate to the complete set of defaulting credit positions held by the banks. An interesting starting point is to break down this total on the basis of the economic activity of the clientele that originated the impaired loans.

This representation is very significant, because it shows that until 2007 the cumulative level of suffering was more or less stable, with growth more in the household sector than in the entrepreneurial sector. Already in 2008 and even more so in 2009, non-financial corporations have jumped to four times the level of suffering recorded in 2004-2005 in 2013.

On the basis of the elements that characterized the SME, a time horizon was chosen starting from 2008, the first year in which the effects of the crisis occurred, in order to produce an analysis on the basis of a set of homogeneous values. Taking into account the data for 2007 would have meant creating significant distortions, given the evolution of the Italian market over the last decade, very different from what were the previous standards.

By monitoring the data of a large number of companies in the period 2008-2016, it should be possible to verify whether the hypotheses of correlation between a correct management of working capital and performance exist in reality.

NET WORKING CAPITAL

Net working capital (NWC) represents the difference between current assets and current liabilities (Banos-Caballero et al., 2010).

This amount emerges from the reclassification of the Balance Sheet with the criterion of management relevance and has, usually, a positive balance for industrial companies, since inventories and trade receivables generally have a greater amount than supply payables and other short-term liabilities. Accounting rules state that an asset or liability is defined as current if it is transformed into cash (in the case of assets) or paid (in the case of liabilities) within 12 months. The NWC is a quantity which, according to the traditional logic of the financial analysis of the capital context, expresses the degree of solvency in the short term. In fact, when it is positive, it shows how the short-term investments are adequately covered by sources with similar or longer-term time horizons, guaranteeing their financing. It is very important to note that when working capital is negative (current assets are lower than current liabilities), this means that the company is in an illiquid situation and, consequently, the financial position shows the coverage of fixed investments with short-term sources of financing. In this case, the company also finances part of its fixed assets with short-term sources (current liabilities), thus exposing itself to a high financial risk. In fact, current liabilities, having a potential short-term collectability, may not be met due to the longer time required to make fixed assets liquid. This situation may lead to the disinvestment of fixed assets, thus jeopardising the company's activities.

Negative net working capital is a cause for concern, as it has been shown that the company, having the remainder of its fixed assets, is unable to pay its short-term debts with current assets either. Moreover, if the medium to long term sources are fixed and consolidated contracts in the company's balance sheet,

the short term sources risk not being renewed and, consequently, leading the company to find itself without part of the financing it previously had available. This is not too serious when short-term liabilities are used to cover short-term assets, because they can be corrected quickly and with limited effects on the company's profitability. In the event of a negative NWC, however, the situation is much more dramatic and the consequences can be very serious, including forcing the company to dispose of assets in the medium to long term.

The notion of working capital in the strict sense of the term includes both cash and cash equivalents and investments related to the operating cycle, regardless of the date of conversion into cash. In this way, the composition is more heterogeneous from the point of view of the payment/realisation date, but more homogeneous in terms of purpose, enclosing in a single value all the elements linked to operations and therefore to the company's core business.

The concept of operating working capital can be further derived from this, which does not take into account cash and cash equivalents, but only the elements actually mobilised and not static: trade payables, trade receivables and stocks.

Since the 1970s, companies have been devoting particular attention to investments related to their day-to-day operations. It has started to be noted that control over day-to-day operations is often more difficult to implement than control over large investments in fixed assets. In fact, when it comes to large initiatives, emphasis is placed on the selection and implementation of decisions, while small amounts tend to be less conspicuous and may seem less significant. Another reason for this difficulty is that the choices related to the day-to-day management of resources are made by a large number of people and not by a few easily identifiable individuals, as is the case for large investments.

As time went by and competition grew, companies were forced to increase flexibility and efficiency to build a competitive advantage. One of the main levers available to management has been to expand the range of services and products offered. This type of action has an impact in particular on two elements of the assets: credits and stocks, which have therefore grown in importance, until they become two of the main components of the company management, not only for their weight in the balance sheet, but also for the strategic importance that they have acquired in this transformation.

If this focus on two components of working capital has influenced international competition since the 1970s, in the last fifteen years, with the spread of an increasingly global market, ever greater competitiveness and the effects of the economic crisis, these issues have become increasingly the subject of evaluation by all types of companies. In fact, an increasingly urgent need to control and plan working capital management has emerged in order to find the right compromise between financial and operational choices. At a time like the present, when there are considerable problems for access to credit, it can be very difficult to combine the needs of the financial area with those of the operating area,

in turn made problematic by competition and the need to maintain production at the level of quality required, without exceeding stocks and regulating the delay in payments.

Since the value of the NWC is so decisive, the choices that determine it acquire fundamental importance and must be evaluated both in a strategic key (evaluation and choice of the role of the single variables) and in a directional key (programming and control of the levels of the single variables, making budgets and forecasts).

It is possible to deepen the evaluation of the working capital going beyond its sign, but it is necessary to consider that, for example, an amount of €100.000 can be extremely significant for a small company, while it can be a variation of little account for a great group. The absolute value alone does not provide a clear indication of the company's performance, so it is advisable to check the deviations over time and its weight in percentage with respect to significant items in the financial statements. In addition, it should be noted that the NWC is not a static measure, because, as defined, it consists mainly of assets and liabilities that will be converted into cash within 12 months (conventionally the duration of the business operating cycle).

The choices made with regard to working capital can be considered among the decisions of the financing mix, which have direct effects on the financial structure and, consequently, on the cost of debt and the level of financial risk perceived by the markets. In addition, negative elements linked to the overall profitability of the company may emerge from the management of working capital in the form of past due or uncollectible trade receivables, or losses linked to inventory obsolescence.

Given this ability to change very quickly, and the importance of the elements that make it up, working capital is an indicator of the much more sensitive condition of others available to management. The use of working capital as a symptomatic variable of company performance is in fact very widespread, as it includes in a single value that can be monitored and is sufficiently sensitive to changes, both the effects deriving from financial risk factors and the elements sensitive to operational risk.

THE OPTIMISATION OF WORKING CAPITAL AND ITS INFLUENCE ON COMPANY PERFORMANCE

Working capital has been addressed by a wide range of sources of economic literature, starting with the main accounting and corporate finance manuals. However, it has been relatively little taken into account by business realities, despite the fact that a large proportion of failures were due to inadequate decisions in the management of business working capital. However, the literature also tended to address the issue of working capital mainly in relation to reclassifications of financial statements, calculations of indicators, and as a component to construct cash flow and financial statements, while today it has acquired new relevance. The lack of clarity and the misunderstandings regarding the

optimisation of working capital are justified by the fact that there is no balance sheet item that allows, at first glance, to identify the extent or trend of working capital. It is necessary to reclassify and choose which notion of working capital to consider, whether net, gross or operational... As a result of these difficulties, many authors have preferred, in the past, to overlook the concept and meaning of working capital, or have addressed it as a subject of lesser importance. This is very significant because a large part of the business failures that have occurred in the recent past have been caused by inefficient working capital management.

The purpose of corporate finance is to make the capital available as profitable as possible. When we talk about capital, we refer to equity and debt on the liabilities side and to fixed assets and current assets on the assets side. In this context, working capital can be considered as an indicator used by financial management to check short-term balances. By adopting this type of reasoning, the NWC acquires a much greater importance than that which has been reserved for this issue in the past.

Several independent studies of the financial statements of large European and US companies have shown that companies tend to hold around 25% more liquidity than necessary. Such a high level of excess liquidity is often associated with particularly high levels of credit, excessive inventory, high operating costs or debt, which are often accompanied by inadequate implementation of strategic initiatives. As a consequence, there will be greater losses in the creation of potential cash flows, profits or profits distributed to shareholders, accompanied by greater vulnerability to possible hostile acquisitions. Considering this scenario, it becomes increasingly obvious that effective management and optimization of working capital are indispensable, despite the fact that in the past they were not a priority, but rather occupied one of the last places on the list of priorities of entrepreneurs. Not only large companies, but also small to medium sized ones have had to recognize how working capital optimization in a critical context such as the current one can become an effective and integrated cost management tool.

This change has been confirmed in recent years by events on the capital markets as well as by new legislative requirements, such as those arising from the guidelines of the Basel II regulations for banks and other money lending institutions. These new regulations limit access to credit for companies, which therefore have to find alternative ways of financing themselves. One of the simplest and least costly mechanisms is sometimes the search for self-financing through proper and optimised working capital management.

During the growth of an activity, the management has the task of deciding which capital structure is best suited to the type of company and the needs that it develops. Often high-level officials tend to think in a long-term perspective, often overriding what is the administration of short term and therefore on the management of working capital. Recent studies (Al-Shubiri 2011) (Falope and Ajilore

2009) (Garcia-Teruel and Martinez-Solano 2007) have demonstrated the importance of managing current assets and liabilities. When a financing need arises, it is preferable to turn to long-term sources of finance instead of changing the company's internal liquidity management mechanisms. For many years, working capital management has been opposed to the excessive effort required to change short-term policies in relation to an insignificant increase in profits (Darun 2008).

Several authors (Meyer 2007) (Schaeffer 2002) (Weinraub and Visscher 1998) support the importance of working capital management, with particular reference to the importance of short-term needs and the management of capital reserves.

Since the financial crisis of 2008, companies have seen a deterioration of their operating environment, with managers forced to apply strict measures, cut costs and postpone investments so as to be able to respond to decreases in demand and consequent reductions in production. As a result, liquidity and working capital have become two variables under close observation, and therefore under continuous monitoring and control. Working capital management has changed a lot and the most common and widespread policies have been adapted to the new economic conditions. Due to the rapid changes in the economy, companies are renewing themselves and are finding new levers on which to focus to compete. Working capital is becoming increasingly important among these.

The optimization of working capital has become an important issue also because companies have had to explore markets looking for alternatives to finance themselves over the past few years, because, despite the fact that interest rates are reduced to record lows, the possibility of obtaining loans from banks or similar institutions has become increasingly reduced. It is a mechanism called credit crunch, i.e. a credit and liquidity crunch that began in the summer of 2007, which brought the spreads of Credit Default Swaps (CDS) to unprecedented levels following the default of Lehman Brothers in September 2008. According to a study of the period (PwC 2010), the companies, recording a decrease in revenues, focused exclusively on costs and revenues, therefore on indicators such as NOPAT in order to increase profitability. However, this attitude led to a general decrease in Return on Net Assets (RONA). As a result, it became necessary to improve this indicator in the medium to long term, the performance of which depends on the ratio of revenues, operating working capital and net assets. In addition to cost containment, the most appropriate way to counteract the worsening of RONA is to improve the factors that affect operating working capital, so as to balance the negative effect of the fall in turnover. In fact, the same study places funding, cash management and elements linked to technology and systems as a priority at the time of treasury, all of which are closely influenced by and/or correlated with working capital management. During the crisis, the number of companies that see working capital as an element of high priority has more than doubled, from 35% to 72%.

Working capital management policies have a direct impact on the supply chain and on relations between companies and customers. As a result, managers need to be aware of the impact of these policies on business performance. There are two main approaches to working capital management, both aimed at meeting the company's requirements for internal, buyer and supplier relationships. A study (Garcia-Teruel and Martinez-Solano 2007) explores these two strategies, one aggressive and the other conservative, which differ in their balance between the weight of current assets and liabilities. Others (Weinraub and Visscher 1998) follow the same line of thought, concluding that an aggressive approach results in a minimization of the capital used for current assets, in favor of medium to long-term investments.

The conservative approach requires the use of a large portion of liquidity in current assets, making the opportunity cost very high. This strategy implies that to finance itself the company has to bear higher costs, but in this way reduces the risks. This decrease in profitability is due to a reduction in the risk of having to deal with liquidity problems, which may arise if suppliers request payment. This method implies the presence of a capital structure in which current assets are mainly financed by long-term liabilities.

The aggressive approach, on the other hand, requires a balance sheet structure in which all non-current assets are financed by long-term sources, while all or part of the current assets are covered by short-term sources. In this way, the company does not own, or only to a very limited extent, long-term capital invested in current assets. By comparing the two strategies, the aggressive approach requires less working capital investment and is characterised by higher profits, accompanied by a higher level of risk. A liquidity problem could cause more money to be disbursed at a particular time than is the case with the conservative approach on a daily basis. Other studies (Meyer 2007) state that the ideal approach is a holistic one and divide the activity of circulating optimization into three activities: Order-to-cash; Purchase-to-Pay; and Forecast-to-Fulfill.

One element to consider is the grievance by many companies that working capital optimization risks damaging or destroying the relationship with the customer. The opposite is certainly true, i.e. that working capital management initiatives improve service to customers and make people more conducive to relations with the company. Similarly, payment of invoices in the required time will encourage suppliers to continue to have common interests, and lead to benefits such as fixed prices, better sales conditions and more services.

One of the possible problems that could rise analyzing the data of the balances is that, if there are accounts payable (or any other operating debt) for which the due date is expired (the company didn't pay in the due time), they should be considered in the financial debts and not in the working capital.

This way to use improperly the operating debts toward the suppliers (or other parts as Tax authorities or Social security Institute) is more significant for the companies which have difficulties to obtain enough financial loans.

So you could consider a decrease of NWC, because of the increase of operating debts, as the capability of the firm to obtain more favorable terms of payment from the suppliers, when in this case could be a signal of financial stress.

Measures to optimize working capital usually originate in a process of determining areas where improvement would be needed by analyzing balance sheets and evaluating changes in working capital over time. In larger companies, it may be useful to compare individual branches or branch offices in order to have the same selection of data. In this way, a potential improvement for the entire company can be quantified in internal comparisons based on the performance of the most important competitors. Once possible improvement actions have been identified, the responsible manager, usually the CFO, should work closely with other managers, customers and suppliers to develop a program to implement the problem. The CFO plays a very important role in this process because, in addition to being responsible for the company's economic and financial data and having a complete look at what the company's processes are, he is usually also involved in strategic decisions, since he must provide funding and communicate the logic of these choices to investors.

While the challenges of working capital optimization vary by company, experience has produced a set of best practices that can also be successful in different industries and are based on the three key processes at play: Order-to-cash; Purchase-to-Pay; and Forecast-to-Fulfill.

With regard to the Order-to-cash process, one has to consider the concept that dissatisfied consumers tend not to want to pay their credits and this can result in overdue credits that accumulate until they become uncollectible. In this regard, credit risk mechanisms should always be reviewed to ensure that they are consistent with the company's strategic objectives and that appropriate cover can be given to these non-payments. It is necessary to minimize the days of payment deferment offered to the level strictly necessary under a strategic sales perspective, involving the commercial department and perhaps offering incentive mechanisms to motivate its members. Moreover, it is advisable to simplify the invoicing system in order to prevent payment delays, also because there are more and more information systems that allow to manage this activity with reduced costs. An important measure concerns the way in which payments are solicited: a standardised and complete process with short reminder periods and the imposition of penalties is the requirement for a reduction in overdue credits, or in any case in the number of days of late payment.

With regard to the Purchase-to-Pay process, it can be noted that, although it is possible to benefit from it immediately, an arbitrary delay in the payment of invoices is not a long-term solution. In fact,

suppliers will notice additional costs and will no longer want to deal with the company. It's equally true that it's a good idea not to source from a single source, but to have a combination of several suppliers, so as to share purchases and the risk that derives from them among more subjects, thus becoming less vulnerable to the claims or failure of a single partner. It is therefore equally important to focus on optimizing business relationships with suppliers who have a high risk or significant impact on profits. This can be achieved by providing free access to privileged business information, developing processes in common with the supplier and sharing efficiency mechanisms. At the same time, reduce attention to low-risk suppliers by automating the purchasing process, for example. The efficiency of the supplier portfolio is very useful in particular for the proper management of relationships with suppliers at high risk of default, but which, having a reduced impact on turnover, is likely to be overlooked. Agreements are particularly valid in the case of suppliers or products with a high turnover, to make more advantageous the deferral time in the case of specific contracts with each subject, as they benefit both the effect on profits and the position for negotiation. A further option is to create internal controls to prevent pre-dated payments so as to make full use of the grace period.

With regard to the Forecast-to-Fulfill process, it should be noted that in the context of planning, production, storage and delivery, today's technology makes it possible to develop forecasts with the help of information about the company as a whole, also taking into account conflicts of interest regarding storage times, customer services, operating costs and product range. In industrial plants with constantly innovative technologies or with products that devalue in a very short time, this is particularly complex. The best method available to the company is to request to count in advance the quantities of product, so as not to buy or produce more than necessary. For the same reason, methodologies and procedures need to be developed to ensure that inventory can be easily located. In addition, a differentiated warehouse strategy is essential to manage a variety of products, although its structure depends on how quickly the goods can be replaced and how important they are to the production process.

The primary objective of working capital optimization is to manage short-term sources so that daily activities can be financed. This function is in fact responsible for the quality of the production, the maintenance of its uninterrupted rhythm and the sales, also because the correct management of the circulating capital makes it possible to increase the profits. Structuring an incentive policy based on working capital has proved to be a rewarding measure, also because greater awareness of sales personnel on these issues has created an information asymmetry with regard to counterparties, creating a competitive advantage and consequently having positive effects on the profitability and liquidity of the company.

In conclusion, the optimisation of working capital and the efficiency of a company's processes (and controls) make it possible to obtain benefits, both direct and indirect. This is because the control environment of this activity is particularly

PRODUCTION SECTORS

As far as the scope of the survey is concerned, it was decided to investigate the food industry, one of the largest and most important realities of Italian production. The three clusters chosen reflect three very interesting areas and relevant realities of the productivity of our country: the production of milk, its derivatives and cheeses, namely the dairy company, the first Italian food sector; the production of sweets, a reality worthy of note especially for the Piedmont region; and finally the production of flour and bakery products, which is a clear symbol of Italian identity in the world. The incidence of these three types of activity on the total turnover of the food industry is also remarkable.

These three areas have been examined because at the level of the production and supply cycle they should be considered as similar, all having to interact with local production, legislation related to the agricultural sector and a deterioration of products in the short term. For these reasons, the results of the analysis could be different, but the variables that affect them are more or less the same, making it possible to look for reasons in a very narrow range of variability.

It is also necessary to consider how, in the years 2008-2015, consumption expenditure related to non-alcoholic food and beverages in Italy has suffered a significant decline, as evidenced by the processing of ISTAT data.

It is clear that until 2006 the growth of average monthly household expenditure grew at a high rate, as evidenced by the moving average over two periods (red) and that from 2008 onwards this growth has not only stopped, but has returned to much lower levels. The sum of 462.33 euros on average for 2008 has never been reached again, despite the recovery underway since 2014. This external dynamic cannot but influence company performance and it will be necessary to take this into account when commenting on the results produced by the analysis.

We will now proceed to a brief analysis of the various sectors, to introduce their peculiarities and characteristics.

Dairy Sector

Dairy is Italy's leading food sector and is responsible for about 12% of the total turnover of the national agri-food sector. In 2009, the value of production exceeded 14.5 billion euros, obtained from one million tons of cheese, of which 460,000 tons of DOP products, three million tons of drinking milk, one billion eight hundred thousand jars of yogurt and 160,000 tons of butter. The processing companies guarantee

the daily withdrawal of all the milk produced in Italy at a price, however, higher than the European average. Moreover, these quantities are unable to meet the country's domestic demand and exports. Consequently, a large quantity of milk has to be imported, especially from other European countries. However, there are no possible alternatives to the current production system: for structural and environmental reasons, the availability of Italian milk will not only not increase, but will tend to decrease, especially in southern Italy.

The global economic crisis has severely affected the system of companies in the sector, putting its ability to survive to the test, due to the structural debt that characterizes it. This is due in particular to the fact that the payment times guaranteed to suppliers are about 60 days, a figure that is a long way from the 270 days that large retailers wait for before paying suppliers. This factor is all the more serious in view of the fact that large mature cheeses take three years from the initial investment before the proceeds are realized. The causes are to be found above all in the excessive pulverization of production. In fact, Italian companies are much smaller and have much less bargaining power than the European companies with which they compete, causing higher production costs and limited competitive capacity. In recent years, therefore, the trend has been towards concentration, due to the low overall profitability of the sector. In fact, examining the data relating to the total turnover of the sector shows that between the values of 2007 (pre-crisis) and those of 2013, there is a growth of only 3.83%. For the other two sectors examined, the results are very different, with a variation of 19,26% for flour and bakery products and 23,76% for the confectionery sector.

The low profitability of the sector is mainly due to a decrease in the attractiveness of milk-based products for consumers, due to the growing demand for vegetable products, lactose-free and compounds of substitutes, such as soybean milk or rice. Milk consumption fell at a rate of 1% between 2012 and 2016. In addition, the European milk quota system, which has greatly influenced the competitiveness, production and growth of the sector in recent decades, was abolished in 2015, allowing new challengers to enter the national market from territories with lower processing and stable milk costs. Despite this crisis, cheese sales made the biggest contribution (62.4% in 2016) to market profitability, compared with 14.5% of the total market share, keeping turnover levels stable.

However, milk is an integral part of the diet in many developed countries and it is not easy to replace it completely. In addition, alternatives for end consumers include other resulting products such as yoghurt and fresh cheese, which provide a similar nutritional supply. One of the major difficulties in the industry is that the rapid perishability of dairy products, together with the regulatory requirements for their preservation, cause high storage and logistical costs due to the high frequency of deliveries. Switching costs are not particularly high for customers and this has a negative impact on the stability of the purchasing trend, but companies can meet new market needs by creating different products. In

addition, there have been some signs of improved performance in the production of typical regional products, especially those with a certificate of origin and protected origin, which are perceived by consumers as a guarantee of high quality.

In order to increase the attractiveness of the sector, dairy companies have introduced new products to the packaging sector, launching formats that are more in keeping with the tastes of customers, and expanding the product portfolio to meet the various needs linked to the methods and opportunities of their consumption. This, in addition to the implementation of lactose-free and highly digestible lines, has led to stable levels of global turnover, which has offset the lower consumption.

Confectionery sector

The confectionery sector is responsible for more than 10% of the turnover of the Italian food industry. Production can be divided into the following segments: sweet bakery products and confectionery, chocolate and candy. This distinction is functional to the fact that the two types of output have very different growth rates. If the market of sweet bakery products has a constant and significant growth, that of confectionery is slowed down and characterized by an average profitability much lower. A special mention should be made of ice cream, a segment dominated by large multinationals and usually aimed primarily at the large-scale retail trade, consisting of large specialized companies and characterized by modest growth. On the contrary, bakery companies are still operating in a fragmented and not very concentrated market, where SMEs have a market share of 45-50%. As far as the chocolate production segment is concerned, there is a strong centralization in the hands of the large groups, first and foremost Ferrero.

As reported by Sole 24 Ore, according to Aidepi (association of Italian confectionery and pasta industries) the confectionery sector has managed to save itself from the negative effects of the crisis, also thanks to the growing openness to the foreign market (up to more than 50% of production), which has balanced the decline in the domestic market. Also on the latter, however, the decrease in consumption of some products such as ice cream and confectionery has found compensation in sales of chocolate and bakery products. This was because confectionery companies found ways to meet the needs of consumers, who in this case corresponded to a more complete range of products, adding to the lines already available a wide choice of premium products. Another important frontier was that of novelties linked to the growing attention of customers to their health, which led companies to develop novelties containing natural ingredients and with lower fat content.

On average, companies in this sector reacted promptly to the new demands of the crisis period, even though some historic brands lagged behind and struggled to relaunch themselves with a format that would survive in this market so influenced by ever decreasing spending budgets and a search for the "special" product to convince consumers to buy. The winning companies have been characterized by a

continuous series of product and packaging innovations, combined with aggressive marketing strategies and loyalty programs.

During the most critical years, the trend of Italian customers has been towards a return to domestic confectionery, to preparing cakes at home, as a cheaper alternative to buying products offered by resale channels. This has corresponded to an increase in the supply of products for the preparation of sweets and has encouraged companies to increase the quality of these types of goods. At the same time, increasing competitiveness among major brands has resulted in lower prices for bakery products, which have returned to being the preferred alternative for consumers as soon as the initial and worst of the crisis has passed.

In addition, it should be noted that companies with a typically seasonal production as Bauli have managed to increase their turnover with a better balance between seasonal and non-seasonal products in their portfolio. Certainly the recognizability of the brands, a guarantee of reliability and high quality of production, has had a great influence on the performance of this sector during the crisis, as the larger companies started from conditions of strength and customer loyalty. In order to maintain this leading role, the companies (e.g. Ferrero, Bauli, Melegatti, Vicenzi and so forth) have continued to produce new lines and new specific products for specific targets and have thus guaranteed a continuous cascade of new products on the market.

It seems appropriate to highlight how this sector has, however, suffered a strong shock during 2016, when a campaign against palm oil, the abuse of which could cause heart problems due to the high level of saturated fat, has made the average consumer reluctant to buy confectionery products, especially Nutella. This analysis, therefore, does not take into account the post-2015 trend and therefore the changes in the confectionery market following this major upheaval.

The flour and bakery products sector

For a complete analysis of this sector, it is appropriate to divide it into two parts: the production of bread and bakery products, and the production of pasta. The outputs of both these areas are configured as a basic product of our diet and one of the prominent symbols of the Made in Italy agri-food.

As far as the pasta industry is concerned, the national production of pasta in 2014 amounted to just under 3.5 million tons, about a value of 4.6 billion euros, or 3.5% of the national turnover of the food industry. Medium-term results show that the production of pasta between 2008 and 2014 has progressed at an average annual rate of around 1.5%. This growth is also underlined by the sectoral outlook produced by Cerved in 2017. As it is clear, this growth is mainly due to the increase in exports, while domestic consumption was stable. In particular, since 2005 the threshold of 50% of the production exported for sale abroad has been exceeded, while domestic demand has substantially

stabilized, as evidenced by the average annual per capita consumption of pasta (equal to 26.1 kg in 2008 and 24.9 kg in 2014) (ISMEA - Istituto per i Servizi del Mercato Agroalimentare 2015).

As far as bread is concerned, internal consumption has also decreased, in the wake of a new trend linked to low-carbs diets, which push, especially among young people and women, a net decrease in consumption of traditional bakery products and pasta. This trend has certainly negatively influenced the performance of companies that produced this type of food. However, flour companies have responded to this difficulty with various strategies, such as portfolio diversification through the launch of whole-grain products based on cereals or particular flours, including the novelty of large-scale products for coeliacs. Other companies have seen the possibility of attracting consumers through the sale of single-portion products that can be useful to avoid waste and reach a target of unique customers. This move was functional to ride the wave of a new need: to have something to "munch" and be able to comfortably take with them. In fact, the decrease in bread sales corresponds to the growth of a segment that is developing very quickly: that of savory snacks.

The search for different ingredients and the use of special flours as an alternative to wheat has made it possible to increase the unit price of products, since consumers demand higher quality raw materials, but are also willing to spend more. In fact, bulk bread showed the highest unit price increase in current currency in 2016. Another trend that should be taken into account is the fact that there has been an increase in sales of frozen bakery products, because despite a reduction in overall bread consumption, consumers appreciate the possibility of being able to keep these products for a long time so that they are available fresh and crisp at any time they want.

However, according to the Euromonitor report, flour products see an increase in sales of bread by local bakeries, and a decrease in sales of industrial products. Moreover, for both pasta and bread companies, the time taken by companies to adapt to new needs has not always been so fast and, as a result, there has been a concentration of production due to a sharp fall in the number of companies operating in the segment.

These factors have had a different influence on the two production lines of the sector: if the pasta company shows an average annual growth from 2008 to 2014 of the production of pasta both in volume (+1.4%) and in value (+1.6%), the same cannot be said for bakery products.

VARIABLES

In order to carry out the analysis, it is advisable to construct two sets of variables: the first set contains the symptomatic indicators of the management of net working capital, and the second set contains the profitability indicators, to measure the company's performance. Each set consists of a pool of variables and indicators, examined in detail in the next two paragraphs.

Variables of Net Working Capital

The variables taken into consideration for the evaluation of working capital belong to two types: the first relating to the dynamics of the operating cycle; the second to the incidence of working capital on turnover. The results of the indicators referring to the operating cycle represent a number of days, while those of incidence are percentages. They are:

Days Sales Outstanding (DSO)

This measure measures the average number of days before customers settle their claims on the company in question after a sale. Irrespective of the extension period granted by the company, creditors may pay before or after this period. The larger this number is, the longer the company has to wait before receiving payment for the goods and services provided and therefore the higher the probability that creditors will pay beyond the fixed deadline, letting the credits expire and having a strong negative impact.

It is physiological that this number is different from zero, but there are no standard values within which it can be considered "good". To make a judgement on the matter it is necessary to verify if the data of the single company are superior or inferior to the average of the enterprises of the same sector.

Days Inventory Outstanding (DIO)

This value represents the average number of days the stock is in stock before it is renewed. This indicator is that one that has perhaps more tie with the nature of the goods, in how much depends on the nature of the same the number of days for the rotation of the warehouse. Consequently, the dimension of such value depends a lot from the field of activity of the company, but generally if it is low it implies that the warehouse must be supplied of frequent in order to face the sales.

Also this indicator cannot have a null result and also in this case do not exist of the standard values in order to judge the goodness of it. It is therefore necessary to operate an evaluation on the basis of the average of the days of rotation of the stocks of the sector to which the company belongs.

Days Payable Outstanding (DPO)

The result of this indicator is equal to the average number of days before the company cancels the debts it has contracted with suppliers. In this case, the nature of the company's activity, but above all the size of the company, has an impact: a known and large company will have more bargaining power and will be able to manage the dynamics of trade debts at will. This consideration is important, because a longer delay on trade debts corresponds to the company's ability to finance itself.

Consequently, even if a value higher than the average could seem a negative signal and difficulty in payments, in the presence of a solid financial situation, it is a sign that the company is financing itself in an alternative way. Again, there are no established values and the results need to be compared with the industry average.

Average duration of the business cycle (Cash Conversion Cycle - CCC)

This value is the summary of the three previous ones, as it is obtained by adding the number of days of deferment of receivables to that of average stockpile, from which the number of days of deferment of debts must be subtracted. It is therefore a synthetic measure that expresses the number of days that a company needs to convert incoming resources into cash flows.

The operation required in order to calculate such indicator implies that it measures how fast an enterprise succeeds in converting the liquidity in stocks of warehouse and in trade debts, through the system of sales and credits, and consequently again in liquidity. Being formed from the combination of these indicators of the state of the business activity, the CCC indicates how much the management is able in the management of the assets and liabilities to short term in order to generate liquidity. Again, the entity should be measured on the basis of the averages of the sector to which the company belongs and the lower the value of the CCC, the more dynamic the company is and therefore the better the result.

Net working capital as a percentage of turnover

This indicator is the result of the ratio between the value of the net working capital and the turnover recorded in the same year. It represents a very simple way to make the NWC, otherwise difficult to compare, comparable between different companies and over different years. This shows the impact of short-term non-financial management on sales, which is sensitive to changes in demand.

The interpretation of the result of this variable is complex, since, as explained above, the NWC should not be negative and this would lead to interpreting the highest possible value as optimal. It is also true that as turnover increases, the result decreases and therefore even a reduction could seem to be a positive sign. Taking into account the fact that the dynamics of receivables, payables and stocks are, however, closely linked to sales, should correspond to an increase in them in correspondence with a growth in turnover. Consequently, the percentage of the incidence should not undergo great variations, therefore a positive value is considered an optimal result, in how much sign that the current management is primary regarding the other activities.

Incidence of active working capital on turnover

The result of this indicator is obtained by the ratio between the components of working capital assets, i.e. non-financial inventories and short-term receivables, and turnover for the same period. In this case, too, the main purpose is the comparability of the result between different financial years and companies, purging the raw data from the influence of the change in demand and making it in percentage and therefore comparable even in the case of companies with different structures and sizes.

As for the previous one, the interpretation of this value is subject to the action of different forces. First of all, it is a good sign that the value is positive, as short-term business growth shows that the

company's core business is dynamic and of considerable importance. Mathematics suggests that an increase in the denominator, i.e. in turnover, which is a positive sign for the company, would lead to a decrease in the result.

In this case, too, it is necessary to consider how an increase in turnover corresponds to an increase in receivables and inventories, with the result that the optimal result is that of a value above zero and consistent. This indicator is very important because it measures the degree of active circulating, that is the element that will contribute in a short time to bring liquidity in cash.

METHOD AND DATA COLLECTION

The main objective of this analysis is to verify whether Working Capital Management has an influence on business performance in Italian SMEs. More in detail, the survey is structured on three levels and on the basis of three questions:

1. Does Working Capital Management affect short-term profitability?
2. Is this incidence the same in SMEs and large companies?
3. Does this impact depend on the sector in which companies operate?

By verifying these three hypotheses, we believe that this survey is complete and that, for the first time, the Italian SME market is examined in depth, using the size and product sector of the companies taken into consideration as additional filters, with a span of time that allows reports to be made on the basis of different intervals.

In order to ensure that the survey basin is large enough to be significant, quantitative data were collected from an online database, AIDA, for the duration of the previously established time horizon (2008-2016). These data are collected for all the companies in the database in the dairy, confectionery, flour and bakery industries.

Once the companies were divided between SMEs and large companies, a descriptive statistical analysis was carried out, which provides an overview of the sector averages for each of the indicators chosen as determining factors and serves to give an overview of the trends of the period.

Subsequently, the indicators relating to working capital management were collected and a score assigned to each company for each year on the basis of these indicators. At this point, the presence of a statistical correlation between the variables related to the NWC and the main profitability indicators previously selected can be verified.

The results produced should be able to give an answer to the three questions mentioned above with regard to the Italian SME in the years following 2008.

AIDA, an online database, was used to collect the data. AIDA is a tool of Bureau van Dijk, a company specializing in the production of products containing company information at national and

international level. AIDA (Computerized Business Analysis) is a factual database containing structured information on more than 700,000 companies operating in Italy. The data are in historical series, up to a maximum of 10 years and the information is constantly updated. The contents are the complete financial statements, according to the scheme of the IV EEC directive, the sectors of economic activity, the complete personal data and a plurality of other information of the Italian capital companies.

Unfortunately, during the research it was found that the 2016 data of most companies were incomplete. As a result, it was decided to shorten the time horizon by one year, in order to facilitate the completeness of the data, which will then be 2008-2015. The research carried out was carried out through the use of ATECO codes, which serve to classify economic activities, to allow the results to be filtered by type of business activity. This classification is adopted by ISTAT for national economic statistics and is optimal for this analysis as it is based on the type of activity carried out by the companies and not on what they produce. In this way, companies grouped under the same code can be considered homogeneous in terms of production processes and therefore the need for supply, production cycle and type of plant. Consequently, such subdivision allows to consider the data of every sector as epurati of the exogenous variables, in how much all submitted to the same influences from the external environment.

As far as this analysis is concerned, in particular, we examined the sectors of the whole characterized by code 10, which groups together the food companies. In particular

Code 105 (dairy industry) was used as a filter for the dairy sector;

Codes 1072 (production of rusks and biscuits; production of preserved pastry products) and 1082 (production of cocoa, chocolate, candies and confectionery) were used to group companies in the confectionery sector;

Codes 1071 (production of bread; fresh pastry products) and 1073 (production of pasta, couscous and similar farinaceous products) were used to select flour and bakery products companies.

In addition to the codes, two conditions were used as additional filters to search for data for each sector: the first is the availability of balance sheets, the second is the presence of known values for CCC.

CONCLUSION, FUTURE WORK AND POTENTIAL LIMITATIONS

The main objective of this study was to setup a sample of Italian SMEs, in order to verify whether Working Capital Management has an influence on their performance. More in detail, the research was based on these three questions, corresponding to as many levels of investigation, i.e.: Does Working Capital Management affect short-term profitability? Is this incidence the same in SMEs and large companies? Does this weight depend on the sector in which the companies operate?

To satisfy these questions, several data were collected through the AIDA database, which lists the financial statements of Italian companies, relating to the variables of working capital, business cycle and performance. This information has been filtered in order to create six clusters, representing SMEs and large companies in each of the three sectors considered: dairy, confectionery and flour and bakery products.

In future works, through a scoring operation and a statistical correlation, results will be obtained, which represent the Pearson-Bravais correlation indices between CCN and profitability indicators over different spans of time (one, two and three years). It will then be possible to give answers based on the results obtained. Surely the WCM has a correlation with short-term profitability, as it will be evident from the fact that in many cases there is some kind of significant direct or indirect relationship. Also with regard to the impact of size on the size of this link, it can certainly be said that it has a weight, as within all sectors, large companies and SMEs behave differently. Finally, it will be shown that the result of the correlation depends on the sector, since each of the segments of the food industry considered has its own behavior.

Unfortunately, while it is undeniable that the WCM has an influence on business profitability by looking at the complete sample, as far as SMEs are concerned, there is often an un-correlation between the trend in working capital and the business cycle and the main performance indicators. This unsatisfactory result may be due to the peculiar conditions of the macroeconomic environment in the years under consideration, in particular the reduction in consumption and average family spending, which have aggravated a condition already made precarious by an exponential increase in suffering and, consequently, bankruptcies and liquidations. These conditions are due to the crisis that has hit the global markets since 2008, and the resulting credit crisis in subsequent years. It should also be borne in mind that the in-correlation results may be due to the typical characteristics of data dispersion. In fact, greater variability in values may invalidate the result of correlation studies, providing in-correlation outcomes even where there is no independence between indicators.

With regard to the management of without recourse, reference is made to a type of factoring that "lightens" the quantity of receivables in the company portfolio, thus affecting the correctness of the data relating to working capital. This tool has been widely used during the years included in the time horizon, since this ensured a better evaluation of the company by banks and lenders, making the company situation seem more prosperous. Unfortunately, the data relating to the use of without recourse would have to be requested individually from each of the companies included in the sample, through questionnaires or direct queries, which would have taken much longer and would have reduced even more the number of companies taken into account. On the other hand, as far as the completeness of the database used is concerned, of the 8,426 companies operating in the three sectors

considered, only 409 had data relating to the entire time horizon and with available values of the size of the business cycle. This sample, however large, corresponds to about 5% of the total and may not represent the total distribution of data.

A STUDY OF THE BENEFITS FOR STARTUPS COMING FROM INCUBATORS

Ribeiro, Humberto¹; Meneses, Raquel²; Sousa, João²

¹ESTGA; GOVCOPP; University of Aveiro, Aveiro, Portugal

²FEP, University of Porto, Porto, Portugal

ABSTRACT

For more than half a century that incubation initiatives have been important for promoting entrepreneurship through technological and innovation policies, supporting the early stages of development and strengthening links among businesses (Schwartz, 2010). More recently, supporting the creation and growth of startups has become a priority (M'Chirgui, 2012). One of the tools for the development of startups are business incubators, institutions that, by promoting special conditions, present themselves as a business support in an embryonic phase, boosting the entry and development of these new organizations in the economic environment (Grimaldi and Grandi, 2005; Aerts et al, 2007; Theodorakopulos et al, 2014; Bollingtoft and Ulhoi, 2005).

The main topic to be examined in this paper is the gap between the value expectations that a startup expects from an incubator versus what it effectively obtains. Within the European Union framework, but focusing specifically on Portugal, it is examined here whether the gap between expectations and perceived benefits affects the overall satisfaction of the entrepreneurs and startups,

To achieve the research goals, an exploratory research, by the means of interviews, was conducted with startups incubated in the North Region of Portugal. While trying to understand and evaluate the startups' expectations regarding what the incubator truthfully offers for incubates development, significant divergences were found, suggesting a relevant level of mismatching between startups and incubators. This research outcome is somewhat surprising as one could expect a better interaction and alignment within the incubating-incubated relationship.

Keywords: Entrepreneurship; Startups, Business Incubators, Expectations Management; Service Quality, SERVQUAL, Customer Satisfaction; Innovation; Performance.

INTRODUCTION

During the 1980s, governments in Europe were facing rising unemployment in sectors such as engineering, including automotive industry, and it was the beginning of recognition that innovation

and technology were becoming key points for national economic growth, having gained strength in the knowledge-based economy (Bruneel, Ratinho, Clarysse, and Groen, 2012).

On the other hand, small businesses, which are the largest segment for job creation, have gained importance while attempting to meet the objectives of innovation, competitiveness and social cohesion. However, the survival ratios of these companies are quite low, especially during the early years (Bollingtoft and Ulhoi, 2005; Theodorakopoulos et al, 2014; Aerts, Matthyssens, and Vandembemt, 2007; Aldrich and Fiol, 1994). This lack of success for new and small businesses is particularly caused by lack of management experience, lack of marketing skills or access to venture capital (Bruneel et al, 2012).

The initial process of a startup and its growth have been the focus of study by several researchers (Aernoudt, 2004; Burns, 2001; Grimaldi and Grandi, 2005; McAdam and McAdam, 2008; Ries, 2011). More specifically, there has been a growing interest in identifying the factors, characteristics and conditions that benefit their creation, development and success (Grimaldi and Grandi, 2005). For these companies the onset of business can be hard and stressing, marked by all sort of difficulties. New companies often lack established products, technological know-how, long-term customer relationships, experienced management teams, sufficient capital and a strong reputation (Zhao and Aram, 1995). In addition, new companies present other pressures such as market entry (Aldrich and Fiol, 1994), access to administrative support and operating costs such as rents and fees, typical barriers for new organizations (Bollingtoft and Ulhoi, 2005).

Supporting the creation and growth of startups has become a priority (M'Chirgui, 2012). New support tools have emerged for new entrepreneurs including institutions that specialize in advising, launching and monitoring new business progress (Albort-Morant and Oghazi, 2016).

One of the tools for the development of startups are business incubators, institutions that, by promoting special conditions, present themselves as a business support in an embryonic phase, boosting the entry and development of these new organizations in the economic environment (Grimaldi and Grandi, 2005; Aerts et al, 2007; Theodorakopoulos et al, 2014; Bollingtoft and Ulhoi, 2005).

Accordingly, the main topic to be examined in this paper is the gap between the expectation of value that a startup expects from an incubator and what it actually obtains. Within the European Union framework, but focusing specifically on Portugal, it is also intended to examine some issues as identify

the main support services expected by Portuguese startups, and understand whether the characteristics of the incubates have some impact on their expectations and perceptions.

To achieve the research goals, an exploratory research, by the means of interviews, was conducted with startups incubated in the North Region of Portugal, with the purpose to understand whether the gap between expectations and perceptions affects the overall satisfaction of the entrepreneurs, regarding the incubators expected benefits.

THE ROLE AND IMPORTANCE OF INCUBATORS

For more than half a century that incubation initiatives have been important for promoting entrepreneurship through technological and innovation policies, supporting the early stages of development and strengthening links among businesses (Schwartz, 2010). Several changes have taken place during this period leading researchers to pay greater attention to the strategic capacity of incubators (Grimaldi and Grandi, 2005), especially for startups looking for complementary assets, technological, visionary and cognitive proximity (Vanderstraeten and Matthyssens, 2012). However, despite this growth recognition, there are still doubts about the ability of incubators to leverage the success of incubated companies (Cornelius and Bhabra-Remedios, 2003; M'Chirgui, 2012).

The concept of incubator is generally used as a general designation for organizations that form or create a supportive environment, contributing to the development of high potential startups (Bergek and Norrman, 2008; Hackett and Dilts, 2004). According to Aernoudt (2004), and most of the literature, the first incubator started in 1959 in Batavia, New York State, United States of America, in response to the closure of several factories (Aernoudt, 2004; Theodorakopoulos et al, 2014; Aerts et al, 2007). However, incubators have been operating since 1942 when Student Agencies Inc. in Ithaca, also in the "Empire State", began incubating student companies until, four years later, American Research Development created the first incubator outside the student community (Chinsomboon, 2000). Over this time business incubators have evolved and even changed or incorporated certain practices (Dee et al, 2011). In Europe the first incubators appeared in 1975, in the United Kingdom, when a British iron company decided to create a subsidiary to create jobs. Due to the collapse of traditional industries (Al-Mubarak and Busler, 2010) from the late 1970s in both the US and Europe, the incubation program would begin to be considered as an industry (Aernoudt, 2004), with the emergence of private companies with the function of supporting innovation and technology transfer (Al-Mubarak and Busler, 2010), where the goal would be to incubate new companies with high growth capacity (Hackett and Dilts, 2004). Despite the emergence of private organizations, most incubators remain public in nature because there is an interest in creating policies that place business incubators as the

main tool for economic rejuvenation (Hackett and Dilts, 2004; Bruneel et al, 2012).

Research on the relationship between the incubator and its incubators began in 1984 with the promulgation of the results of the “National Survey: Profile of Business Incubators” by Temali and Campbell. Despite these early efforts and academic interest in several countries to synthesize and analyze the state of incubation, there is still no consensus in the literature (Hackett and Dilts, 2004; Theodorakopoulos et al, 2014).

The growing spread of business incubators calls for a more detailed analysis and observation of what this phenomenon really is, what specific sources can be of value for entrepreneurs, what organizational foundations really work on, the practices, resources and services that help effectively to the growth of startups (Bollingtoft and Ulhoi, 2005).

BUSINESS INCUBATORS’ SERVICE QUALITY AND SERVQUAL DIMENSIONS

In order to business incubators effectively support the startups activities, it is important that they provide a service with quality. Nevertheless, because the service is a set of activities or processes that are produced and consumed simultaneously, it becomes difficult to manage and access quality control (Gronroos, 1988). The precise dimensions of a service’s quality vary from sector to sector, and while it is currently simpler to identify overall dimensions, there is some difficulty in developing the best method for measuring service quality (Ennew, Reed, and Binks, 1993). The concept is simple, and has been described as an attitude related to satisfaction (but not equivalent) and is measured from a comparison between expectations, i.e. expected quality, and perceptions, i.e. perceived quality (vig. E.g. Ennew et al, 1993; Cronin and Taylor, 1992). This means that quality of service is the measure of how well the provided service delivered matches with the customer expectations. Quality service occurs when a service meets previous expectations (Parasuraman, Zeithaml and Berry, 1985), meaning that a good quality of service is achieved when customer perception meets its initial expectations (Gronroos, 1988).

Service quality and SERVQUAL approach are very well documented and examined in literature, therefore one will not develop much further on this research paper. Nevertheless, it is important to stress that these concepts are important for the research, as they were used, inclusively with the inclusion of several SERVQUAL dimensions. Therefore it is relevant to briefly examine the importance of business incubators’ service quality for entrepreneurs and startups.

In resume, the incubator is regarded here as having to create customer value through a wide range of

services (Vanderstraeten and Matthyssens, 2012). A well-managed incubator with a good quality of service can bring several advantages to incubated ones, such as cost savings (Mian, 1996), space sharing and secretarial services (Buys and Mbewana, 2007) and increased credibility (McAdam and McAdam, 2008), enhancing certain skills associated with entrepreneurship (Abduh et al, 2007), access to mentoring (Scillitoe and Chakrabarti, 2010), internal and external synergies, information (Tötterman and Sten, 2005) and funding (Mas-Verdú et al, 2015). This distinction depends on tenants' expectations and perceived value in offering different benefits (Vanderstraeten and Matthyssens, 2012), giving importance to the clients' point of view on the services provided (Abduh et al, 2007). Among other dimensions of analysis of business incubators value creation for startups, in this paper the effective satisfaction of the entrepreneurs with this incubating service is examined, in order to access whether the expected benefits from the incubators' provided service are real and according to the startups expectations.

A STUDY OF THE EXPECTATIONS AND PERCEIVED BENEFITS FOR STARTUPS COMING FROM INCUBATORS

In a changing world and business environment, Portugal has been facing several difficulties, which even led to the need of a program of international financial aid. The last decade has produced major changes in the international environment, which, together with domestic economic issues, produced deep effects on the Portuguese economy, mostly negatives, as the rise in unemployment, but with policies as well to try to cope with the negative situation, as measures to support entrepreneurship, ease of establishment and closure of companies, tax changes, or the new "Business Insolvency and Recovery Code " (D&B, 2017a). Together with technological advancements and a greater ease of access to information, the most recent period proved to be more prone to entrepreneurship, so that according to the Barometer D&B Informa in a recent period of 12 months (July 2017), in Portugal were created 39,015 companies, more 5.7% over the 12 months immediately before (D&B, 2017b). Therefore, one can wonder whether this has something to do with any incubators role.

However, the incubators benefits for startups may not be that clear. According to the literature, incubators provide a number of benefits that favour the creation, growth and stability of startups such as more economical rents, support services, location, and more. However, in numerous empirical studies on the relationship between an incubator and an incubated (Al-Mubarak and Busler, 2010; Bollingtoft and Ulhoi, 2005; Tötterman and Sten, 2005), these benefits have been analyzed from an incubator perspective rather than from the new business point of view. For the acquisition and organization of information, many studies carry out incubator surveys. It is a useful but limited

method as it cannot represent the incubated point of view, making it difficult to correctly assess the perspective of new companies (Dee et al, 2011). Accordingly, one can wonder whether the incubators are effective in their purpose to properly assist entrepreneurs and startups.

Research framework

When thinking about the objectives of a startup integrated into an incubation process, common sense tells us that the purpose of this relationship is to survive in the early years of business where it is new and relatively small. However, the objectives of the incubate can go beyond that. Startups may choose to adhere to an incubation strategy for as many reasons as the number of benefits incubators can offer. As analysed during the literature review, studies on the relationship between startups and incubators are still very few, and very limited, especially when this is analysed from the perspective of the incubated ones. The research so far focused mostly on topics from the incubator's point of view. This evaluation makes it difficult to analyse the expectations and the perception of the incubated ones about the process, two crucial factors for satisfaction assessment within a service.

Therefore, in this paper, the examination is based on the perspective of the startups in order to obtain conclusions that indicate how the incubator is evaluated by the incubator in its strategic plan, development and cycle.

Research hypotheses

This paper intends to analyse the gap between the expectations and the perceived quality of the incubation process taking into account the experience of the startups. We intend to examine, from the perspective of the incubated ones, the initial expectations of the startups when they join an incubator and what is the quality perceived after the incubation experience. To achieve this purpose, it is necessary to identify the main benefits expected by the startups and what they really feel the incubator may provide them.

It is also intended to understand the role of the characteristics of the incubated in the expectations and perceptions of the same. Finally, if there is a significant gap, we intend to analyse its impact on overall satisfaction. In resume, the basic research question of the paper can be assumed as an examinable hypothesis: *is there a gap between expectations and perceptions of startups in the face of an incubation process?*

Complementary, it is considered relevant to make an assessment regarding the main benefits expected versus observed by the incubated during the incubation process, together with an assessment of whether there is a confirmation or disconfirmation of expectations and how they affect the overall satisfaction of the startups, being such also considered as hypotheses for further possible testing.

Research methodology

The research method used was the interview, as its advantages range from depth of information to flexibility (Gill, Stewart, Treasure, and Chadwick, 2008). In order to develop a rich and flexible method, semi-structured interviews (vid. e.g. Zhang and Wildemuth, 2016) were applied to five Portuguese startups belonging to different incubators in the Porto city region. In semi-structured interviews there are no specific questions. In turn, an interviewer has a list of key points and topics that he or she wants to see addressed, covering the issues depending on the direction the interview takes (Longhurst, 2016). The five companies that agreed to be interviewed were sent a guide with the questions and key points they intended to address. In addition to the factors mentioned above, the interviewing method is advantageous because the interviewer can delve into the issue if he / she believes it is necessary, as well as can investigate more specific key points of the interviewees and not just adhere to the interview guide, or even recreate the questions, if they are not clear to the interviewee (Kajornboon, 2005). On the other hand, semi-structured interviews also have their disadvantages, such as the interviewer's possible inexperience that can result in unanswered key questions and greater difficulty in probing unclear crucial points (Kajornboon, 2005). The time required to perform this method is also another disadvantage, since one has to select participants, decide where to conduct the interview, set an available date for both, and transcribe the interview (Longhurst, 2016). The five companies that were available to conduct the interview were sent a document with the questions that were considered crucial for the exploration phase. Subsequently, interviews were scheduled and conducted at the incubator facilities (only one of the companies preferred to conduct the interview in a neutral location). Interviews were transcribed shortly after their completion, as listening to the audio shortly after it is made transcribing it much simpler (Longhurst, 2016). All interviews were sent to the company concerned to confirm that there were no errors regarding the terms used, names of companies, acronyms, as well as if the idea received was in agreement with what the company wanted to demonstrate. After confirming all the transcripts, the generated data were then collected and analysed with the support of NVivo software in order to produce a questionnaire that corresponded to the reality of the panorama to be investigated. In NVivo, two distinct positions were created for the data: expectations and perceptions. Each of these positions initially clustered eleven nodes, where six corresponded to those analysed in the literature review (subsidiary space rental, funding and policies, sharing facilities and services, relief services, credibility and social capital) and five corresponded to the key SERVQUAL dimensions: reliability, security, understanding, empathy and tangibility. The text was analysed and marked if a statement was related to a particular node, both in the expectation or in the perception position.

Research sample

In order to carry the study of the incubated perspectives, before it started the incubation process, the

data collection involved two stages of collection of information, allowing to prepare two different samples, but which, however, have the same characteristics, i.e. companies that belonged or belong to an incubation process in Portugal. For the research presented here, i.e. using semi-structured interviews, we chose a sample of companies located in incubators in Greater Porto region. As referred before, the sample comprises five companies that have been shown a semi-structured script in order to be interviewed.

The first company interviewed was SBSS Consulting. This company belongs to the consulting and SAP partnerships and was created in 2014 with only one founder, Luís Barros. However, shortly thereafter, two new members, both close friends, joined the organization to support the commercial side. The founder already had experience in the SAP area, but had never taken on the role of entrepreneur. The company was initially incubated at ANJE (Associação Nacional de Jovens Empresários - National Association of Young Entrepreneurs) from Maia city, but in the meantime, with the hiring of two new employees, ANJE's space became small and moved to a Business and Innovation Centre, the NET (Novas Empresas e Tecnologias – New Enterprises and Technologies). Currently the company employs seven employees.

The second interview was made to BYP - Boost your project, a company established in September 2016 which was founded by two partners. Pedro Santos, the founder who was available to be interviewed, has training in the area of management, and has professional experience in several multinationals. The decision to start a project of his own arose two and a half years ago, when he met the other partner in a training on entrepreneurship. After a long period of brainstorming and optimization of the idea, came the BYP, which consists of developing a set of service solutions and management support, which until then did not exist in a significantly integrated way, combining some concepts of sharing economy. Since the beginning of its activity, this company has used the support of the INOVAGAIA incubator.

The third interview was held soon after, following a contact obtained by Cideb. The company that was made available was Ibeen, a company founded exclusively by Daniel Costa, in 2015, which consists of the design of the funny concept associated with tourism in t-shirts and merchandising, i.e. closely linked to the creative industry. The founder had academic experience in management and at professional level had experience as an entrepreneur once he started the Montaditos business in Portugal. The company was inserted in several incubators, incubating, at an early stage in the PEC pole of UPTEC (Science and Technology Park of University of Porto). Subsequently decided to relocate to another incubator, this time to Cideb. However, the company, at a stage of product development, made the strategic decision to incubate in a more technical incubator and business

incubator, Fábrica Santo Thyrsó, in Porto city outskirts.

The fourth interview took place some days after and was directed to Samuel Gonçalves, the only founder who has academic and professional experience in the area of architecture. The company consists of an architectural studio, officially created in 2015, after being a finalist of the National Creative Industries Award. The size of the company is fluctuating, with between three and five employees (the effect of the Erasmus Plus support program that allows the number of employees to be expanded). The company is not seen as a traditional studio, as it seeks to create processes and constructive systems with the goal of minimizing construction at the level of resources and time. The company is headquartered at UPTEC, at the pole of the creative industries, after having passed through the Startups School of UPTEC, a program that provides training and support base of management and creation of a business.

Finally, we had the opportunity to interview Luís de Matos, the founder of the company Follow Inspiration. This company was born officially in 2012 to develop the WiiGo product, which consists of a shopping cart completely autonomous, designed to carry the purchases of a customer with reduced mobility. This project appeared when Luis de Matos, the founder, was finishing his degree in Computer Engineering and had to develop a final project. The first prototypes were developed at the university where they were incubated for a year. Later they migrated to the incubator Parkubis, but only with the commercial and financial part for reasons of business policy. In spite of invitations from countless incubators, they decided to never strategically engage in an incubator until the emergence of CEIIA, a private incubator that had the resources needed for Follow Inspiration to produce its hardware allied to an internal and external network that matches the needs of the incubated company.

RESEARCH RESULTS

In order to present the research results in a concise way, two figures were prepared. Both figures represent the ratio of nodes that each benefit presents in respect to the totality of the information collected from the interviews. In Figure 1, shown below, are presented the entrepreneurs benefits expectations with the incubating process.

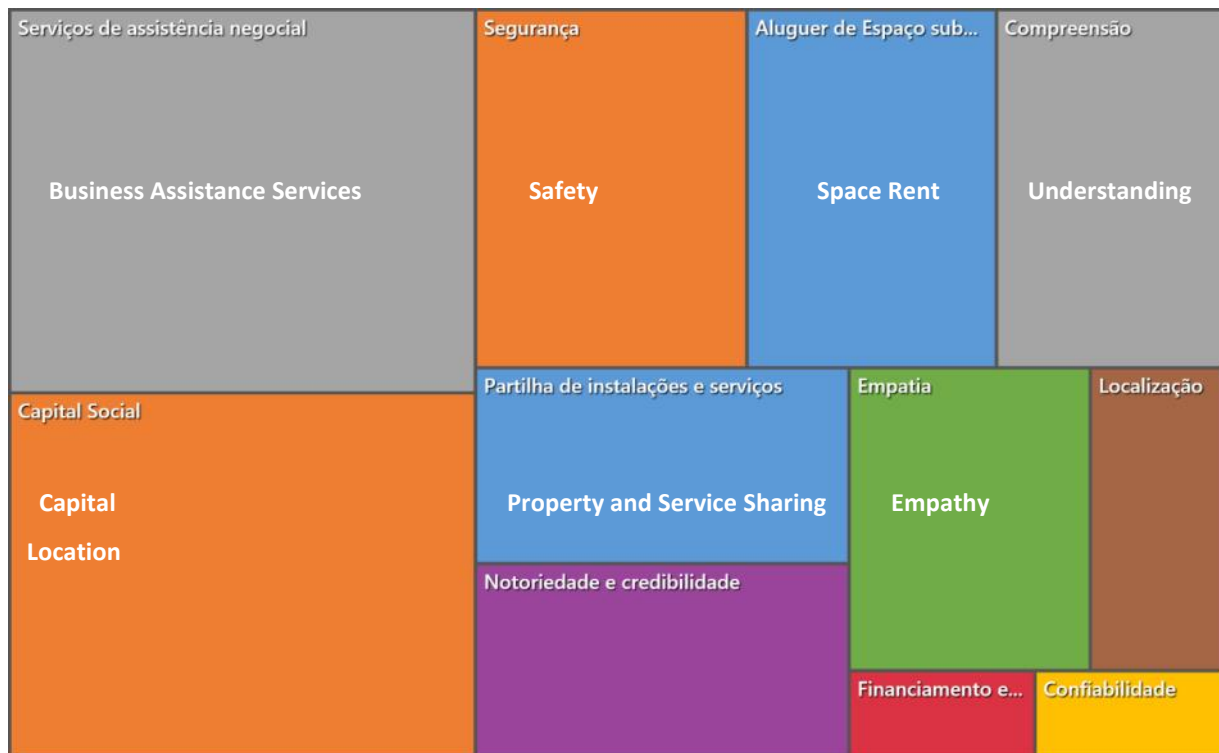

Figure 1. *Expectations: importance by size node of each expected benefit type*

Similarly to Figure 1, in Figure 2, below, is shown the importance and quality of benefits as perceived by the startups with the incubating process, being such importance understood by the node size of each expected benefit type.

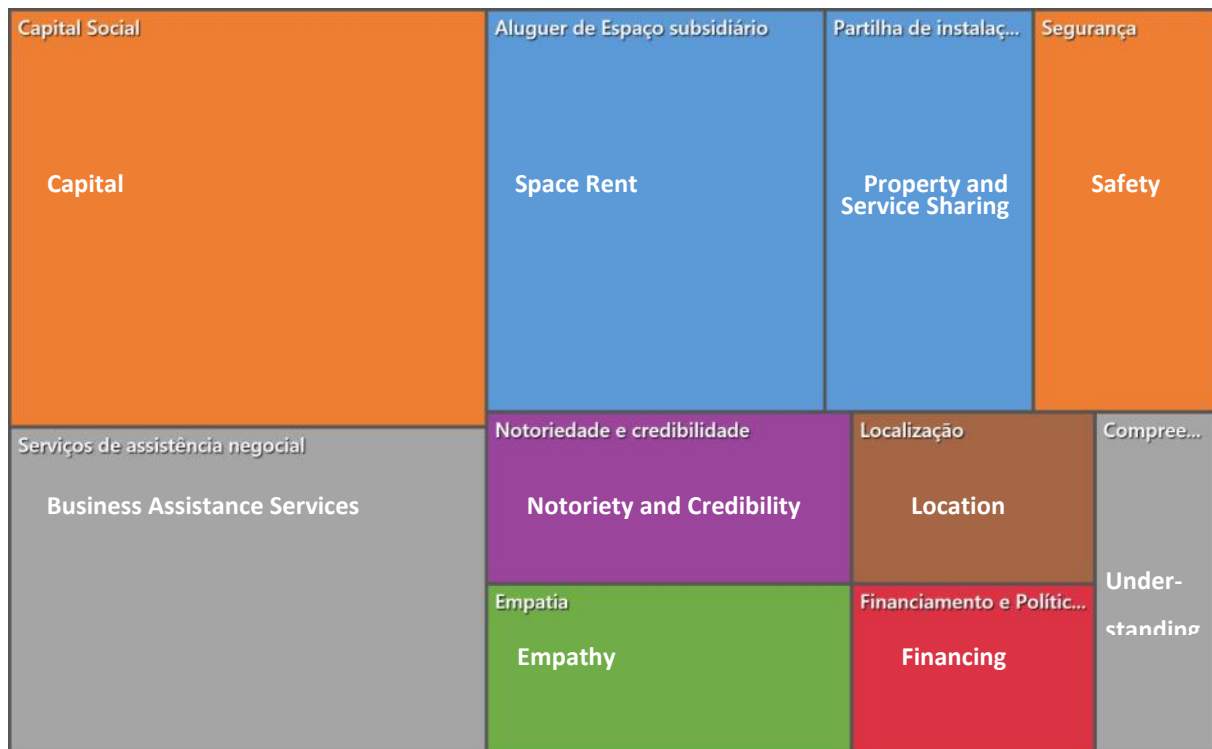

Figure 2. *Perceived Quality: importance by size node of each perceived benefit type*

As we can observe from Figure 1 and Figure 2, SERVQUAL factors were added to the analysis.

However, the tangibility factor does not seem to be a relevant factor for the incubated companies in the Portuguese panorama, since during the five interviews it was not mentioned not even once.

Furthermore, it was not possible to corroborate many findings of existing literature, as they were not, overall, observed in the research presented in this paper. On the one hand, a new benefit has been added in both the research sides of expectation and perception. This benefit is the "location", since it was mentioned in several interviews. Localization is important for service firms (Goldstein, Ward, Leong and Butler, 2002) and is where and why companies practice their activity in a specific area (Goerzen, Asmussen and Nielsen, 2013). On the other hand, during interviews it was possible to verify that most of the benefits were mentioned by all the interviews, but not in the same way; i.e. although a certain benefit is mentioned in different interviews, it might not have, however, the same weight in the decision, or incubation strategy. For example, in one of the interviews, the employee assumes that he "had the expectation of receiving some management support", but that "he may not have looked for the best", because it was not the factor most needed. There is no factor that measures the difference between a benefit mentioned with great appreciation, and the same benefit mentioned, but that is not given so much relevance. Consequently, beyond the expectations and perceptions, was added the "importance" factor as well, given by the incubated company to a certain factor.

DISCUSSION OF RESULTS

Considering the results, as shown in figures 1 and 2, we can conclude that the factors mentioned during the interviews are referred about the same number of times in both expectations and perceptions. However, by analysing the interviews contents as well, it is possible to verify that the expected factors are not exactly the perceived ones. In this discussion about such divergence, we will quote directly the respondents. Nevertheless, as we need to respect the confidentiality of the respondents, we will use the code letters: A, W, X, Y, and Z, as a proxy for each startup that participated in the study.

In the case of Capital benefits, respondents said they opted for the incubator because they expected greater proximity to "partner companies and other technology companies" (X) by networking. Nonetheless, from the various incubated companies, one could record that "only two or three other incubates can boost my business" (e.g. Y), whereas "networking exists, but there is potential for much more" (e.g. Z).

Concerning Business Assistance Services, which is very much negotiation assistance, the incubated "sought mentoring, someone to help with the next steps and with the notion of business"; someone

who help to “position yourself in business”; and “predicting the difficulties”. However, their perception about the incubating services were that “no”, “you have no one to do that”, because “those who are helping to create businesses are people who have never created businesses” (Z). The incubators indicate that there are “events and trainings” running, but is missing “a personal advisor or management support that was more capable and more experienced” (X).

Complaints from startups come in several forms. For example, for most respondents, incubators “choose to do what is easier: being merely a business condominium” (Y). For W, “an incubator has to stop being an simply an incubator, can not only rent space, has to accelerate its incubations”.

Nonetheless, there was satisfaction expressed as well. A, assumes that all expectations have been confirmed, i.e. the business has decided going for the incubator to acquire “communication support”, linking to the university, facilitating contacts and negotiating assistance. Consequently, such satisfaction is expressed clearly: “the perception I had before entering turned out never to be defrauded”. This behaviour can be observed in most factors (exception to reliability, not mentioned in the perceptions).

In resume, it is possible to observe that the factors most expected by the incubated actually exist, but not in the expected way, suggesting that there is a lack of confirmation of expectations. However, infrastructure factors such as “Rental”, “Sharing”, “Security” and “Location” are closer in terms of expectations versus perceptions. For the other factors, many respondents assume their existence, but not at the expected level. Respondents assume that the service adopted by incubators is “standard” (X; Y; Z). This concept may justify the greater disparity between expectations and perceptions regarding benefits that do not involve infrastructure and require greater specialization such as “Business Assistance Services, Understanding and Capital”.

CONCLUSIONS

While trying to understand and evaluate the startups’ expectations regarding what the incubator truthfully offers for their development, significant divergences were found, suggesting a relevant level of mismatching between startups and incubators. This research outcome is somewhat surprising as one could expect a better interaction and alignment within the incubating-incubated relationship.

The results suggest indeed a high level of “non-confirmation” of expectations from startups. Capital and Business Assistance Services are good examples as such divergences, as startups are not getting the type of benefits they were expecting to. However, infrastructure factors such as “Rental”, “Sharing”, “Security”, and “Location”, are closer in terms of expectations versus perceptions

evaluation.

Another symptom of dissatisfaction from startups, revealing incapacity from the incubators side to fulfil the needs and aspirations of their incubated businesses, is the fact they are constantly changing and moving from incubator to incubator. One could perceive that as natural, as many incubators have deadlines for the incubating process, or because different incubators may offer different features and benefits. Nevertheless, the level of expectations gap captured in this research suggests that, indeed, incubators may not be performing as expected, forcing startups to move and to search for other options.

Despite this negative finding, it is important to bear in mind that, as any research, this presents limitations as well. The main one may be considered the low size of the sample used to draw conclusions. Accordingly, as further research we suggest to expand the sample and the nature of the research itself. That did not allow entirely fulfilling the research goals and providing comprehensive answers to every research hypothesis outlined here. Regardless this fact, while testing the hypothesis whether there is a gap between expectations and perceptions of startups in the face of an incubation process, enough evidence has been collected to support the existence of such gap. Furthermore, it becomes clear that the divergence not only exists, but is supported by qualified opinions as well.

Therefore, as main contribution, we believe that this research may serve for incubators to understand what are the key factors effectively valued by startups. This may help incubators to find a better focus in order to actually be more successful while helping startups to be successful as well. Finally, we recall that, unlike most previous research, which was carried looking by the lens of the incubators, in our study the subject of examination was the entrepreneurs and startups' views, and therefore our exploratory findings may be considered as a significant developing research breakthrough.

FINANCIAL STRUCTURE INSTABILITY AS FAILURE SYMPTOM IN THE AVIATION INDUSTRY - THE JET AIRWAYS BANKRUPTCY CASE

ABSTRACT

The global aviation industry has been changing very rapidly in latest years, most of all because of evolving technology and consequent commercial models. These changes have impacted also the Indian sector, forcing Indian airlines companies to face new and unpredictable challenges, not always successfully. The bankruptcy of Jet Airways is a relevant example in this respect. In the following study, the financial structure of the corporation has been an object of a particular investigation, aiming at understanding if financial turbulence for an airlines company could constitute an antecedent for predicting risk of bankruptcy. A combined evaluation using Altman's Z score, Piotroski's F score, and Beneish's M score has allowed to highlight that these equations can reveal financial instability as bankruptcy predictor, and potential earnings manipulation as financial malpractice in the governance and management.

Keywords: Aviation sector, airlines, bankruptcy prediction, financial structure instability, India.

INTRODUCTION

Companies operating in the aviation sector serve almost every part and every corner of the world, and hence they play an important role in the creation of the world economy. Considering the global turnover generated by airlines, the aviation sector in general constitutes a major financial force, with reference not only to the related supply chain (aircraft manufacturing and maintenance, fuel, and so forth), but also to the related sectors (for example and most of all, tourism).

The international aviation industry has seen a considerable growth in last five years (from 2014 to 2018) and is anticipated to reach around USD 832.8 billion in 2020 with 3.7% of CAGR (Compounded Average Growth Rate) over the few years till 2020 (Lucintel, 2012). A strong contribution for this development comes also and most of all from promising economies around the sphere, with continuously increasing demand for consumption, desire for carriers, deregulation for transportations,

and so forth, all factors which are driving the aviation industry escalation for example in markets like Middle East and Asia.

From the inception of the first airplane, the sector has dealt with many discoveries and innovations, from jet airplanes for commercial use in the 50s to the “jumbo jets” in the 70s. At the same time, airlines companies were heavily regulated throughout the globe, making an atmosphere in which technological advances and government policies took preference over profitability and competition.

After the economic deregulation of the aviation sector in the USA in 1978, competitive behaviour, operating a customer satisfaction / cost efficiency balance, with strong focus on profitability, become a priority issue for airlines management. After US showing the way, aviation deregulation and consequent ‘liberalization’ involved much of the industrialized world, affecting both domestic and international air travel, allowing continuing development of a very competitive international sector.

With specific focus on India, civil aviation has emerged as one of the fastest growing sectors during the latest years. Currently, India is thought to be the 3rd largest domestic aviation market in the world and experts predict that in coming future India can surpass the UK and become the 3rd largest air passenger market by 2025 (IBEF, 2019).

Indian aviation industry is on the increase at very fast pace: enormous geographical spread, industrial growth, and also enhanced connectivity, which nowadays is crucial for the success of airline companies, are all factors that make the airline industry ever more meaningful. Because of this continuous demand, the Indian government is thinking about increasing the total count of airports to 250 till the year 2030, spending around USD 12.1 billion on infrastructures to support this evolution, with a private contribution, out of all the above-mentioned investment, of around USD 9.3 billion. Technology, expertise, and funds of private players are interesting fascinations for enhancing the aviation sector growth opportunity, and thus the Indian government has decided to attract private capital through an intensive use of Private-Public Partnership (PPP) models and also foreign capital increasing potential FDIs (Foreign Direct Investments) up to 49%. Therefore, the aviation industry, which in the past was largely if not totally controlled by the government agencies, will work with the private sector, only in airlines companies, and this possibility will benefit passengers and customers in general by increasing competition (Sathpaty et al., 2017).

In a so evolving context, Indian airlines are experimenting new business models and solutions. From the innovating structure of the domestic market and from the intriguing dynamics of the global market, can derive as usual advantages and disadvantages, for whose handling soft skills like strategic flexibility, resiliency, and serendipity are critical. Some airlines have found acceptable, successful, or excellent ways to react and succeed, and others have not; the latter is the case of Jet Airways.

Thus, main aim of the research in question is to understand if financial instability can constitute a relevant symptom for prediction failure (also) in the Indian aviation industry, considering the peculiar nature of the sector and the particular characteristics of an emerging economy. In this respect, the case of Jet Airways, for the specific reasons that will be analyzed, constitutes a very useful object of investigation, trying to determine also if potential misconduct in governance and management of the company could have influenced the business failure.

The paper structure is as follows: after a literature review on bankruptcy prediction models, with specific evidence on those ones that has been used so far for the aviation industry, research objectives and methodology are object of presentation, with following determination and application of three financial models for bankruptcy prediction to the case study under investigation. Consequent results discussion, with indication of research limits and implications, will highlight the main contribution of the paper.

FOCUSED AND ESSENTIAL LITERATURE REVIEW

Bankruptcy prediction modelling is a considerable and widely studied issue in the business community, and these applications are going to have an ever more significant impact on financial institutions' profitability, from lending decisions to finance restructuring. To the best of our knowledge, the most important studies about predicting bankruptcy have been object of development by scholars like Altman, Piotroski, and Beneish, and among these scientific results quite probably the most known indicator at global level (Amendola et al., 2011; Kosmidis and Terzidis, 2011; Fusco and Migliaccio, 2018) is Altman's "Z score" (Altman, 1968).

$Z = .012X_1 + .014X_2 + 0.033X_3 + 0.006X_4 + 0.999X_5$, where

X_1 = Working Capital / Total Assets

X_2 = Retained Earnings / Total Assets

X_3 = Earnings Before Interest and Taxes / Total Assets

X_4 = Market Value Equity / Book Value of the Total Debt

X_5 = Sales / Total Assets

Altman evolved the calculation equation during the years, arriving to the following formula, which nowadays is the most common in use to calculate the Z score (Altman, 2000):

$Z = 1.2X_1 + 1.4X_2 + 3.3X_3 + 0.6X_4 + 1.0X_5$

The exact cut off of this discriminant analysis is equal to 2.675, even though this should represent a 'grey' area. More reliably, a value over 2.99 implies high probability of high financial stability, while a value under 1.81 implies high probability of high financial instability.

With particular reference to the sectorial perimeter of study of the current research, Altman developed further evolution for his model(s), extending its application also to preventing financial distress (Fulmer, 1986; Altman, 2013), non-manufacturing firms (Altman, 2000; Kolte et al., 2018), and emerging markets (Altman, 2005).

For non-manufacturing companies, Altman's model was further revised as follows (Altman, 2000):

$$Z = 6.56X_1 + 3.26X_2 + 6.72X_3 + 1.05X_4$$

For emerging markets, Altman's model was further revised as follows (Altman, 2000):

$$Z = 3.25 + 6.56X_1 + 3.26X_2 + 6.72X_3 + 1.05X_4$$

In revised models created for non-manufacturing companies and emerging markets, calculation of X_4 was operated using book value of equity in place of market value of equity. In new models, a value over 2.6 implies high probability of high financial stability, while a value under 1.11 implies high probability of high financial instability.

Furthermore, it is to remember, with particular reference to the geographical perimeter of study of the current research, that Altman's Z score has been used also for investigations about the Indian Banking System, pointing out the high level of NPAs (Non-Performing Assets) in Indian nationalized banks – around USD 120 billion collectively in 2016 – and a quite evident connection of this financial malpractice to management factors like moral hazard, outright corruption, and political nepotism. That is why the following analysis about Jet Airways will consider not only Altman's Z score, but also Piotroski's "F score" (for confirmation about bankruptcy prediction), and even Beneish's "M score" (for evidence about potential misconduct).

Piotroski's F score evaluates the overall strength of the financial position of the company. Piotroski assigned 0 and 1 on the basis of specific conditions and criteria, with this score ranging from 0 to 9, on a clearly imaginable positive meaning (Piotroski, 2000).

$F = X_1 + X_2 + X_3 + X_4 + X_5 + X_6 + X_7 + X_8 + X_9$, where

$X_1 = \text{ROA}$	= EBI (net income before extraordinary items) / TA (total assets)	1
$X_2 = \Delta\text{ROA}$	= difference as concerns ROA from year to year	1
$X_3 = \text{CFO}$	= CFFO (cash flow from operations) / TA	1
$X_4 = \text{ACCRUAL}$	= (EBI – CFFO) / TA	1
$X_5 = \Delta\text{MARGIN}$	= difference as concerns (gross margin / TA) from year to year	1
$X_6 = \Delta\text{TURN}$	= difference as concerns (total sales / TA) from year to year	1
$X_7 = \Delta\text{LEVER}$	= difference as concerns (total long term debt / average TA) from year to year	1
$X_8 = \Delta\text{LIQUID}$	= difference as concerns (current assets / current liabilities) from year to year	1
$X_9 = \text{EQ_OFFER}$	= common equity issue (1 if not, 0 if yes) ``	1

If Piotroski's F score is around 8-9, then the company's financial structure is strong; if it is around 0-2, then the company's financial structure is weak. Obviously, the higher the score is, the greater the strength of the financial structure of the company is, and vice versa.

Finally, Beneish's M score is about possible earnings manipulation (Beneish, 1999). For the calculation of this indicator, assessors must use a combination of 8 indexes to obtain a global score for detecting if the earnings of the company have been object of manipulation or not (Rao, 2013).

$$M = -4.84 + 0.92X_1 + 0.528X_2 + 0.404X_3 + 0.892X_4 + 0.115X_5 - 0.172X_6 + 4.679X_7 - 0.327 X_8,$$

where

X_1	= DSRI	= Days Sales in Receivables Index
X_2	= GMI	= Gross Margin Index
X_3	= AQI	= Asset Quality Index
X_4	= SGI	= Sales Growth Index
X_5	= DEPI	= Depreciation Index
X_6	= SGAI	= Sales General and Administrative (expenses) Index
X_7	= TATA	= Total Accruals to Total Assets
X_8	= LVGI	= Leverage Index

A score that would be higher than -2.22 (that is, less negative) show high probability of manipulation. In truth, Beneish developed also a 5 indexes combination, with different weights, as in the following formula:

$$M = -6.065 + 0.823DSRI + 0.906GMI + 0.593AQI + 0.717SGI + 0.107DEPI$$

Standard applications of the above-described scores (Altman's Z and Piotroski's F in particular, while Beneish's M can be considered a 'potential' indicator, expressing suspect of misconduct) use them as unique indicators for bankruptcy prediction. In the following investigation, as above-mentioned, they will be used altogether, for reciprocal interaction / confirmation.

When considering the aviation industry in particular, Altman's Z score has been object of consideration in several studies about bankruptcy prediction (Wang et al., 2013; Vasigh et al., 2014; Lu et al., 2015; Stepanyan, 2014; Majid et al., 2016), even after the calculation of a specific industry model, named "Air Score" (Chow et al., 1991). Adoption of Altman's Z score has been frequent also with particular reference to the Indian aviation industry (Pandey and Rathore, 2013; Kolte et al., 2017; Safiuddin, 2017; Kulkarni, 2018; Mahtani and Garg, 2018).

To the best of our knowledge, instead, while only one study considers altogether Altman's Z score and Piotroski's F score about bankruptcy prediction for the aviation industry (Kolte et al., 2018), no previous study considers altogether Altman's score, Piotroski's score, and Beneish's score in a

combined analysis. In this original combination, the contribution of the current investigation should find main evidence.

RESEARCH QUESTIONS AND METHODOLOGY

With general focus on the aviation sector, and with particular focus on the India aviation sector, forced to face several innovative management issues in the latest years, the specific scope of investigation of the current research concerns the possibility of evaluating the financial instability of an airlines company for detecting / predicting possible bankruptcy, subsequently considering also potential misconduct of the company governance and management. A case study – Jet Airways – has been object of investigation in order to give answer to the following research questions:

- 1) Was the financial structure of the company good or bad in the close years before bankruptcy?
- 2) Was it possible to predict the bankruptcy of Jet Airways?
- 3) Was there any earnings manipulation in the financial communication?

All the financial data about Jet Airways that have been object of analysis in the current study have been retrieved from annual reports, balance sheets, profit and loss accounts, and cash flow statements of the company. In addition, specific online sources regarding business community information have been investigated, most of all for retrieving some ratios of the company (for example, Moneycontrol.com, Valueresearch.com, and others), and obviously the corporate website. Calculation results have relied mainly on consolidated financial statements, and appropriate assumptions and interpretations were used wherever required.

In particular, Altman's Z score has been calculated to find evidence about bankruptcy probability, the Piotroski's F score to find evidence about financial structure strength, and the Beneish's M score to find evidence about likelihood of earning manipulation. A global and final evaluation of all the above-mentioned indicators has allowed a general assessment of the overall financial condition of Jet Airways before its official bankruptcy.

THE CASE STUDY INVESTIGATION

Jet Airways Ltd. was founded by Naresh Goyal, who, after almost three and a half decades of domination by Air Indian Airlines and Air India in the domestic market, when the Indian government reopened the Indian domestic aviation market to private carriers in April of 1989, was ready to found Jet Airways in 1992. During its 'normal' lifetime, the company has been very successful, becoming the most important domestic operator in India, with an average fleet age of 4.45 years and many routes inside and outside India, arriving at almost the half of the domestic market with a 43% coverage; nonetheless, in the recent past Jet Airways carried 1.28 million passengers per year, out of 4.08 million

passengers carried by the whole airlines industry in India (Mehra, 2011). The company enjoyed a high reputation for punctuality and outstanding service, consequently attracting tourism and business travellers.

Unfortunately, Jet Airways stopped in 2018 its international flights, remaining active only with the domestic ones: in 2019, after the resignation by the founder Naresh Goyal, also the domestic flights were stopped. Reasons for this crisis has been illiquidity consequent to high losses, with the impossibility of the company to pay suppliers and service providers as concerns airplanes leasing payments, fuel, and wages for employees: on the 20th of June, 2019, «... the National Company Law Tribunal has ordered the commencement of a corporate resolution, insolvency resolution process of the Jet Airways (India) Limited» (www.jetairways.com).

In order to understand if this crisis could have been predicted and, if possible, differently managed, Altman's Z score, Piotorski's F score, and Beneish's M score have been object of calculation. Following subparagraphs will focus on each of them, while the following results discussion will present some specific and global considerations.

Altman's Z score calculation on Jet Airways

Financial Ratios	Mar-18	Mar-17	Mar-16	Mar-15	Mar-14	Mar-13
Working Capital / Total Assets	-0.56	-0.52	-0.51	-0.57	-0.57	-0.45
Retained Earnings / Total Assets	-0.56	-0.54	-0.32	-0.38	-0.25	-0.10
EBIT / Total Assets	0.01	0.19	0.12	-0.07	-0.18	0.02
Market Cap. / Total Liabilities	0.53	0.46	0.36	0.32	0.16	0.24
Book Value of Equity / Total Liabilities	-0.55	-0.50	-0.30	-0.37	-0.24	-0.10
Sales / Total Assets	1.94	1.96	1.36	1.30	1.17	1.09
Z Score (revised formula)	0.84	1.47	0.93	0.06	-0.35	0.63
Z Score (Non-Manufacturing Industries)	-5.99	-4.46	-3.89	-5.79	-6.00	-3.21
Z Score (Emerging Markets)	-2.74	-1.21	-0.64	-2.54	-2.75	0.04

Table 1 – Authors' elaboration on data from Money Control, 2019; and Value Research, 2019.

After looking at the results of Altman's Z score (revised formula based on Altman's Z score model of 1968) calculation, it is quite evident that this application could have predicted bankruptcy of Jet Airways. The Z score remains much below 1.81, which is evidence that the company may face financial crisis or may go bankrupt in the future, since through the years it is constantly lower than 1.81, thus implying high probability of high financial instability.

In the current research, Z score for Non-Manufacturing Industries and Z score for Emerging Markets have been calculated in particular considering Jet Airways (as non-manufacturing company) and India (as emerging market). If the score is lower than 1.1 (and it is constantly negative through the years), there is high probability of high financial instability, with the company that is most likely to go bankrupt anytime in the future.

Piotroski's F score calculation on Jet Airways

Indicator	2018	2017	2016	2015	2014
F Score	5	7	9	7	5

Table 2 – Authors' elaboration on data from Money Control, 2019; Rediff Moneywiz, 2019; and Value Research, 2019.

From the above calculation it is quite evident that during the observed years Jet Airways has never been in a 'safe' zone, i.e. equal or higher than 8, except in 2016. It is also evident that in some years (2015, 2017) the financial situation of the company was not completely distressed, but at the same time, according to Piotroski' M score, it was not considerable as a good investment (Timmermans, 2018).

Beneish's M score calculation on Jet Airways

Variable	2018	2017	2016	2015
DSRI	0.888	0.806	1.094	1.005
GMI	0.940	0.966	1.187	1.143
AQI	0.930	1.605	1.014	1.173
SGI	0.926	0.982	0.925	0.884
DEPI	0.001	0.001	0.001	0.001
SGAI	0.968	1.004	1.029	1.073
TATA	-0.197	0.041	-0.071	-0.124
LVGI	0.957	0.740	1.046	0.953
TAA-CA-PPE (from Table 1)	1,815.000	1,708.590	4,155.100	4,145.670
M8	-4.186	-2.776	-3.357	-3.562
M5	-3.236	-2.855	-2.751	-2.737

Table 3 – Authors' elaboration on data from Moneycontrol, 2019 (2014 data not available).

Beneish's M score provides global idea about the potential earning manipulation that might have happened in the company, after combining the eight or five values in the formula. If considering the 8 variables formula, a score higher than -2.22 (that is, less negative) shows high probability of manipulation: from the above table it is quite evident, through the observed years, that all the M scores have been lower than -2.22, thus implying that according to the M score the financial data of Jet Airways were not object of manipulation.

RESULTS DISCUSSION

Put it shortly, answers to the three research questions are the following:

Id.	Research Question	Answer
1	Was the financial structure of the company good or bad in the close years before bankruptcy?	Bad
2	Was it possible to predict the bankruptcy of Jet Airways?	Yes
3	Was there any earnings manipulation in the financial communication?	No

Table 4 – Answers to the research questions (RQ).

More analytically, Jet Airways started in 1992 and showed great potential through its business life, but constantly facing troubles, most of all with regard to the financial structure (and liquidity above all), even though its results from a commercial point of view were successful. Thus, the major reason for the crisis of the company, which in April 2019 blocked completely domestic and international flights, must be found not in the commercial model, but in the finance model, or better still in the capacity of Jet Airways of transforming revenues into cash.

In truth, if adopting Altman's Z score or Piotroski's F score, information for predicting a potential bankruptcy was completely available: in fact, none of the values of these two scores during the 2014-2018 period was sufficient to guarantee financial stability to the company. On the opposite, these values were all predicting clearly potential bankruptcy.

However, considering that Beneish's M score has showed constantly, during the observed years, that the financial data of the company have not been object of manipulation, it is possible to argue that the failure of Jet Airways was not due to fraudulent intentions of the entrepreneur and / or managers, but to their above-mentioned incapacity of handling efficiently the finance model of the company. This consideration seems to confirm first, how budgetary control is vital for successful performances (Dowd et al., 2010), and second, that business failure is the result of a non-performing process, and not only the potential consequence of negative situations (Jimeno-García et al., 2017).

As fundamental contribution emerging from this investigation, the combined use of the indicators that have been considered (Altman's score, Piotroski's score, and Beneish's score) seems more complete and enlightening than single indicators adoption. First, because Altman's score and Piotroski's score can be used for reciprocal confirmation, considering that anyway they are financial calculations and not measures of 'live' business (as happens also in previous studies); second, because Beneish's score can provide evidence about potential misconduct or not, thus giving chance to better understanding if bankruptcy prediction derives from distortion in the business management or in the earnings

manipulation (as happens, to the best of our knowledge, and limiting this consideration to the Indian aviation industry, only in this specific research).

RESEARCH LIMITS, IMPLICATIONS, AND CONCLUSION

The most evident limitation of the research concerns the use of secondary data for understanding the possible reasons of failure of the company under investigation, while naturally business environment, competition, and 'struggle' are much more complex than a document containing financial information. Thus, empirical investigation through interviews of qualified stakeholders would constitute a further step for the progress of the research.

From a scientific point of view, the study has confirmed validity and reliability of Altman's Z score and Piotroski's F score, since both were clearly indicating potential bankruptcy for Jet Airways in the period under observation, while Beneish's M score revealed the absence of manipulation. From a managerial point of view, it seems evident that the failure of Jet Airways was not due to a malfunctioning of the commercial model, but most probably to the incapacity of managers about making the finance model work.

At the last, financial structure instability is an evident failure symptom, also in the aviation industry, as emerged from the Jet Airways bankruptcy case. Application of most used scores for bankruptcy prediction is then absolutely required, at least for alerting the managers responsible in charge for taking into careful and continuous consideration both parts of the business model, i.e. the commercial one and the financial one.

AN AHP MODEL TO EVALUATE THE INFLUENCE OF CALENDAR EFFECTS ON INVESTMENT CHOICE

Rossi Matteo; Marcarelli Gabriella; Ferraro Antonella; Lucadamo Antonio

dept. DEMM, University of Sannio, Benevento, Italy

ABSTRACT

The aim of this paper is to apply the analytic hierarchy process (AHP) to an investment choice problem regarding two financial markets: France and Spain. Our model's evaluation criteria are stock market return, government bond performance, the presence of calendar anomalies and the number of listed firms for both markets.

As regard to stock market return, government bond and the number of listed firms, they are widely available from international database; instead, in order to study calendar anomalies, we have to perform some mean difference tests for different financial markets.

Once we constructed the model, we collected data through questionnaires: the analysis involved 50 students from DEMM Department of the University of Sannio (Italy) who have worked on financial market simulators. The application of AHP shows that investors prefer diversified investments, with a prevalence of the French over the Spanish market; furthermore, in their choice, they are influenced by the presence of calendar anomalies.

Keywords: calendar anomaly; investment choice; AHP.

INTRODUCTION

Due to the globalization, today, investors can choose among many products (stocks, bonds, government bonds, derivatives) in different financial markets (Almujamed and Alfraih, 2019). Portfolio management choices are complex and dynamic because financial investors differ in their objectives and constraints (Khaksari et al., 1989) and require flexible and analytic decision tools and methodologies for investors. Furthermore, an investment decision is regarded as a major and strategic choice and, therefore, should be conveniently modelled (Zopounidis, 1999). Many qualitative and quantitative factors may influence an investment choice, and these factors often conflict with one another. So, portfolio management choice may be considered as a multi-criteria decision problem.

Zopounidis and Doumpos (2002) analysed in-depth some multicriteria characteristics of financial decisions and provided useful applications of multicriteria methods to financial problems (Bankruptcy and credit risk assessment, Portfolio selection and management, Corporate performance evaluation,

Investment appraisal). Zopounidis et al. (2015) provided a bibliographic survey of multi criteria decision aiding for finance.

Based on these statements, the aim of this paper is to propose a theoretical decision model to investment choice problems and provide an empirical analysis. The Analytic Hierarchy Process (AHP) may be useful for this task (Saaty 1980, Ülengin and Ülengin, 1994 and Zopounidis, 1999). Zopounidis (1999) stated that the AHP has an original contribution to the investment decision process, intervening across the whole process, from the stages of perception and formulation to evaluation and choice.

Several evaluation criteria could be considered in this analysis. In our model we take into account three evaluation criteria: stock market return, government bond yields, the number of listed firms and the presence of calendar effects. In particular, we focus on the influence of calendar anomalies on the investment choice. Calendar effects are cyclic earnings irregularities where the series is founded on the calendar. "The calendar time hypothesis states that the market behaves differently at different hours of the day, on different days of the week, and at various times of the month and year" (Rossi, 2015). Different researchers such as Agrawal and Tandon (1994), Gultekin and Gultekin (1983), and Ariel (1987) exhibited the existence of observed calendar anomalies with their evidence in different stock exchanges of world.

We point out that, with regard to this last criterion, we have to perform some statistic tests.

The paper is structured as follows. At first, we present the literature review about AHP method and calendar effects. Then, we propose our theoretical model and show some results of an empirical analysis. Finally, we provide some concluding remarks and limitations and future directions of our research.

LITERATURE REVIEW

AHP background

AHP is a multicriteria decision method developed by Saaty at the end of the 1970s that allows to analyze complex problems by combining both qualitative and quantitative aspects in a single framework and generating a set of priorities for alternatives, using pairwise comparisons (Saaty 1980).

AHP is widely applied for dealing with different choice problems in several fields (Marcarelli, 2018). Typical choice. With regard to finance, it is used for financial performance evaluation, credit appraisal, financial failure prediction, and portfolio selection. The AHP is used for evaluating the exchange rate (Ülengin and Ülengin 1994), to predict financial failure (Hogan et al. 2000). Zopounidis (1999) analyses the contribution of AHP in solving financial decision problems in a realistic, multidimensional context. Spronk et al. (2005) realized an in-depth presentation of the contributions of multi-criteria decision analysis (MCDA) in finance, focusing on the methods used and applications. Zouponidis et al. (2015)

present a systematic bibliographic survey of MCDA contributions in financial decision making, and identify established and emerging research topics, future opportunities and challenges.

Calendar anomalies background

Calendar anomalies are intended when precise dates or periods of the calendar year affect the change in share prices. The calendar effects hypothesis states that the market behaves differently at different hours of the day, on different days of the week, and at various times of the month and year. Numerous studies and experimental research projects (Wachtel, 1942; Rozeff and Kinney, 1976; French, 1980; Barone, 1990; Agrawal and Tandon, 1994; Dodd and Gakhovich, 2011) have been conducted on this topic. Below, the most important calendar anomalies are examined.

Weekend effect. The weekend effect is a calendar anomaly under which the market is characterized by low mean returns on the first day of the week in comparison with the other days of week. Fama (1965) and Granger and Morgenstern (1970) were the first to show that in the stock market the closing price on Monday is less than the closing price on the previous Friday (Latif et al., 2011). The presence of a weekend effect on the market was confirmed by several studies over the years (Gibbons and Hess, 1981; Schwert, 2003; Miller et al., 2006).

January effect. "As goes January, so goes the year" is a popular rule in the stock market famous as the January effect. In particular, "Evidence is provided that there are strong seasonalities in the stock market return distributions... The seasonality, when it exists, appears to be caused by the disproportionately large January returns in most countries..." (Gultekin & Gultekin, 1983: 469). Though Wachtel (1942) provided the earliest evidence of abnormal stock returns in January for US stock markets, Rozeff and Kinney (1976) were the first to formally report this effect in the US stock market. Similar results were reported by Barone, 1990; Agrawal and Tondon, 1994; Wong et al., 2006; Mylonakis and Tserkezos, 2008; Rossi and Fattoruso, 2017.

Holiday effect. The holiday effect can be defined as a fully predictable stock exchange closure because of a public holiday (Pettengill, 1989). This anomaly affects the performance of daily stock returns and is observable in markets characterized by different holidays (American, English and Japanese). Al-Loughani et al. (2005) and Ariel (1990) verify that growth is particularly significant in the days leading up to Christmas and May 1st compared to other holidays. Different observations (Lakonishok and Smidt, 1988; Meneu and Pardo, 2004; Dodd and Gakhovich, 2011), confirm these results.

Turn-of-the Month effect. The turn-of-the-month effect was first identified by Ariel in 1987 for the US equity market. He observed that mean returns are higher at the end of one month and at the beginning of the next month. Moreover, Pettengill and Jordan (1988) showed that cumulative returns during the short window of the turn-of-the-month could constitute as much as 55–70% of monthly

returns. Similar results were reported by Hensel and Ziemba, 1996; Wong et al., 2006; Rossi and Fattoruso, 2017.

METHODOLOGY

This paper proposes a theoretical model, based on the AHP, to an investment choice problem regarding different financial markets France and Spain. We select these European countries because they are unknown to our sample (in term of stock market return, government bond, number of listed firms and calendar anomalies). The evaluation criteria used in our model are stock market return, government bond performance, number of listed firms and calendar effects in the financial markets considered. To analyze last criterion, we performed some mean difference test regarding a 10-year period.

First, we analyze the calendar anomalies introduced in the previous section.

For studying each calendar effect, we calculate the averages of the rates of change for both indices and perform a graphical analysis to evaluate the behavior. Then, to verify if there is a significant effect in the markets, the following statistical test on proportion differences is performed:

$$H_0: \pi_1 - \pi_2 = 0$$

$$H_1: \pi_1 - \pi_2 > 0 \quad \text{or} \quad H_1: \pi_1 - \pi_2 < 0$$

where π_1 is the population proportion of positive (or negative) changes in the considered period (for example January), whereas π_2 is the population proportion in the other periods.

In order to verify if the null hypothesis (H_0) has to be rejected or not, we consider the following statistic:

$$Z = \frac{p_1 - p_2}{\sqrt{p_c(1 - p_c) \left(\frac{1}{n_1} + \frac{1}{n_2} \right)}} \sim N(0,1)$$

where:

p_1 is the relative frequency in the sample extracted from the first population

p_2 is the relative frequency in the sample extracted from the second population

$$p_c = \frac{n_1 p_1 + n_2 p_2}{n_1 + n_2}$$

n_1 and n_2 are the sizes of the two samples.

If $Z > z_\alpha$ (or $Z < -z_\alpha$) then the null hypothesis has to be rejected. z_α is the quantile of the normal standardized distribution and α is the chosen significance level (Piccolo, 2010).

Weekend effect. To test the presence of the weekend effect, we analyse the relationship between changes in stock prices that occur on Monday and on weekends. The goal is to verify if the proportion of positive changes on Monday is lower than the proportion of positive changes on Friday.

January effect. To verify the presence of the January effect, we examine whether the proportion of positive changes in stock prices that occur in January is greater than the proportion of positive changes in stock prices in the other months of the year.

Holiday effect. To test the presence of the holiday effect, we verify if the proportion of positive changes that occurred during the days preceding the holidays is greater than the proportion of positive changes on the other days of the year.

Turn-of-the Month effect. To verify the presence of the turn-of-the-month effect, we observe if the proportion of positive changes in stock prices on the last day of the month and the first three days of the following month is greater than the proportion of positive changes on the other days of the month.

Established the four evaluation criteria we construct the AHP model.

The AHP procedure involves the following 4 phases (Saaty, 1994; Saaty and Vargas, 1982).

1. *Decomposition of the problem into a hierarchy:* the first level of the hierarchy contains the overall objective of the problem; the second level contains the evaluation criteria; the next levels may contain more detailed criteria (sub-criteria); finally, the bottom level contains the alternatives.
2. *Data collection by means of pairwise comparisons:* the elements of each level are pairwise compared with regard to each element of the upper level. A numerical value a_{ij} expresses how much the i -th element, x_i , is preferred to the j -th element, x_j , as regards a given criterion: if x_i is strictly preferred to x_j then $a_{ij} > 1$, whereas $a_{ij} < 1$; the indifference among the elements is indicated by $a_{ij}=1$. Judgments are assigned using the Saaty's fundamental scale. For each hierarchical level, pairwise comparison matrices are constructed. These matrices are reciprocal, that is $a_{ji}=1/a_{ij}$, for $i,j=1,\dots,n$, and all values on the main diagonal are equal to 1. The judgments expressed by pairwise comparisons may be not consistent (transitivity and/or proportionality could not hold). The consistency of judgements is important because it is strictly connected to the reliability of preferences (Grzybowski, 2016).

Several consistency indices have been proposed in literature to measure the level of inconsistency of pairwise matrices (Saaty, 1980; Koczkodaj, 1993; Salo-Hamalainen, 1997; Crawford and Williams, 1985).

3. *Deriving relative priorities.* The priority vector may be estimated by using one of the following methods: the eigenvector method, the arithmetic mean method, the row geometric mean method, the logarithmic least squares method, the singular value decomposition, to cite just a few (Saaty 1980, Aguaron and Moreno-Jimenez 2003, Pelaez and Lamata 2003, Gass and Rapsak 2004).

4. *Synthesizing relative priorities to obtain the global ranking*: relative priorities are aggregated by the principle of hierarchical composition to obtain global priorities providing the final ranking of alternatives.

ANALYSIS OF RESULTS

An empirical analysis is performed to verify the presence of calendar anomalies in the two markets, using the CAC 40 and IBEX 35 indices' price data. Euronext Paris calculated the first one and "Sociedad de Bolsas S.A." calculated the second. The survey examined the calendar anomalies for the period 2007-2017 and data were collected on "Yahoo finance". There are 2811 and 2807 observations for CAC 40 and IBEX 35, respectively. To evaluate the presence of calendar effects in the two markets, the statistical test described in the previous section was implemented, using a significance level $\alpha = 0.05$ ($n = 1.645$).

Table 1 synthesises the results of our analysis for the two markets for the period 2007 – 2017, using the CAC 40 and IBEX 35 indices.

Table	Presence of calendar effects	
	Financial markets	
Calendar effects	France	Spain
Weekend effect	Yes	Yes
January effect	Not available	Not available
Holiday effect	Not available	Yes
Turn-of-the month effect	Not available	Yes

Table 1. *Presence of calendar effects in France and Spain - authors' calculations*

When the calendar anomalies are analysed, the problem is hierarchically structured in order to apply the AHP. The hierarchy is composed by three levels: the goal, 4 criteria and 4 investment choices (Fig. 1).

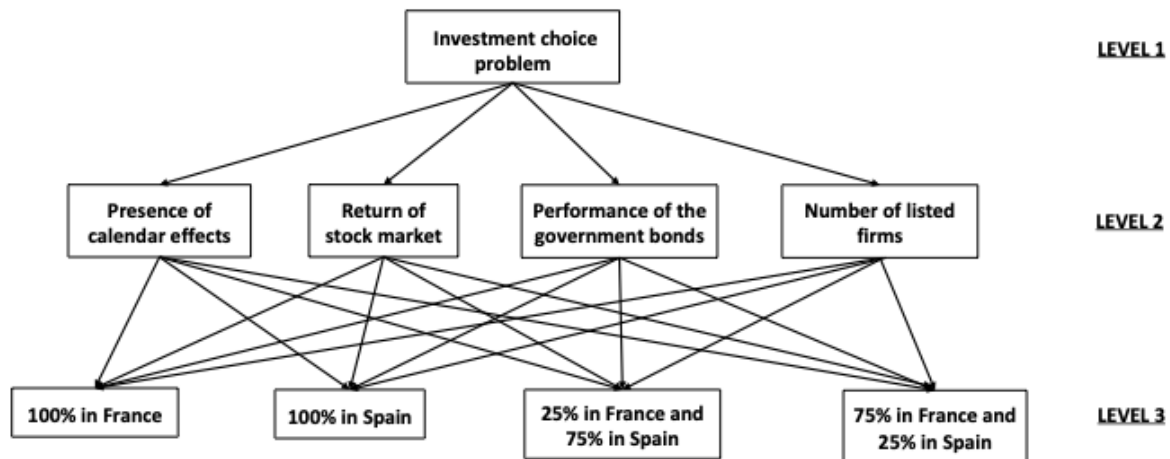

Figure 1. Hierarchical structure of the problem.

A simple questionnaire is constructed and submitted to 50 experts. Then individual judgments expressed by experts are entered in matrices by using Expert Choice (Expert Choice 1994), a software which implements the AHP method.

By aggregating the relative priorities, a global priority vector is calculated for each expert: this vector represents the individual ranking of preferences.

The same procedure is applied to each expert so we have 50 individual priority vectors. The methods commonly used in the literature for aggregating individual priorities in the AHP context are the weighted arithmetic mean and the weighted geometric mean methods (Forman & Peniwati, 1998).

We aggregate individual preferences assuming that all experts are weighted the same. Table 2 shows the global ranking of the alternatives for the group of experts: students prefer a diversified investment with 75% in France and 25% in Spain; the worst choice is the investment with 25% in France and 75% in Spain. Regarding to the weight assigned to criteria, Tab. 3 shows that the presence of calendar anomalies is less important than the stock market return (0.35), but more important than the government bond performance (0.22) and the number of listed firms (0.16): the experts assign a weight equal to 0.27 to the presence of calendar anomalies, and the most important criterion in the investment choice is the stock market return in 2017.

Table	The global ranking of the investment choices		
	Priority vectors and ranking		
Investment choice	Priority vector	Normalized priority vector	Ranking
100% France	0,2509	0,2714	2
100% Spain	0,2189	0,2369	3
25% in France and 75% in Spain	0,1947	0,2107	4
75% in France and 25% in Spain	0,2597	0,2810	1

Table 2. Ranking of the investment choices

Table	The global ranking of criteria		
	Priority vectors and ranking		
Criteria	Priority vector	Normalized priority vector	Ranking
Presence of calendar effects	0,2157	0,2719	2
Return on the stock market	0,2739	0,3451	1
Performance of the government bonds	0,1776	0,2238	3
Number of listed firms	0,1263	0,1592	4

Table 3. Ranking of evaluation criteria

CONCLUSION

This paper proposed a multi-criteria theoretical model to analyse a problem of investment choice in two financial markets: France and Spain. In particular, we taken into account the influence of calendar anomalies on that choice. At first, we make an in-depth analysis of calendar anomalies through some statistic tests: there are three anomalies in Spain (weekend, January and turn of the month effects) and one calendar anomaly in France (weekend effect).

The aim is to define the application of AHP in a stock market decision investment. We want to realise a model that could help decision maker to define a strategy in the investment decision. This is a preliminary study and it requires important improvement to generalise the results. In this first application of AHP, we detected that students prefer a diversified investment in the two countries with a prevalence of France on Spain. Concerning the criteria, the weight of the presence of calendar anomalies is lesser than that associated with the stock market return.

The AHP model allows us to decompose the problem into a dominance hierarchy and provides for subjective judgements expressed through pairwise comparisons that require a consistency check. Moreover it is flexible and allows us to check if the ranking changes based on varying criteria weights.

Instead, we have to point out that the uncertainty of other investors' behaviours and the uncertainty connected to the country risks could influence the AHP results.

In this paper, we presented some preliminary results. To avoid any influence, we have considered investors coming from Countries other than those considered in the analysis. Our aim is to extend the analysis by involving a great number of students/investors and compare results obtained by applying other multicriteria methods. Furthermore, we could assign to each student a weight depending on his/her level of knowledge of financial tools (i.e. based on the year of undergraduate degree course).

ABSTRACT

The objective of the paper is to look into economic and political situation of Iraqi Kurdistan in context of its oil industry relations with Russia. In the Kurdistan Region of Iraq (KRI), economic development and infrastructure recovery extended at a great pace over the last decade. In order to achieve the aim, authors firstly adequate explained to research below a brief history of the Kurdistan and political relations with the sample country. Next, it presents underlying economic relations of (KRG) with Russia in recent years in the oil field.

In this article, the authors argue that ensuring the cooperation and good political relations between Kurdistan and Russia will guarantee: (a) changes in power relations of the Kurdistan Region with Iraqi government and own achievements in self-governance, (b) solve the problem of difficult circumstances accompanying the region's oil export and as a result making economic development and national security of Kurdistan, (c) benefits and long contracts of the two parties will help to solve political crisis of the Region with other neighbor countries especially Russian factor to solve unexpected tensions between Kurdistan and Turkey, Iran regarding Kurdistan's independence, (d) after American sanctions on Iran especially in the sector of oil and gas, Russia can fill this gap with investment in Kurdistan oil and gas sector to increase the mutual hydrocarbons industry development.

Keywords: Kurdistan Regional Government, Russia, Economic Development, Rose Neft, Hydrocarbons, National Security, Economic Resources, Macroeconomics, Kurds, Iraq.

INTRODUCTION

Kurds are the largest stateless minority in the world, with an estimated 30 million Kurds in a geographic area encompassing territories in Turkey, Iraq, Iran, Syria, and Armenia. They comprise 18% of the population in Turkey and 15-20% in Iraq, and are the third largest ethnic group in the region after the Arabs and Persians (Galloway, 1958). According to (Philips, 2016)The Kurdish people

is a distinct one in the Middle East, it is the fourth largest ethnic group with an estimated population of 40-45 million and are divided between Iraq (7 million), Iran, Turkey and Syria. Their history dates before the existence of the Sumerians, Medes, Ayyubids, Safavids and Ottomans. The modern history of the Kurdish people has for the past 100 years been centered on four main themes; betrayal, abuse, war, and the struggle for national liberation. The Kurdistan Regional Government (KRG) was formed in 1992 by the Kurdistan National Assembly, the first democratically elected parliament in Kurdistan (and in Iraq) following the no-fly zone designed to protect the Kurdistan Region from the violence of Iraq's former Ba'ath regime. The KRG developed experience and expertise throughout successive cabinets, especially after the fall of the former regime in 2003. These included the construction of international airports, proactive oil and gas policy, reconstruction of the Region's infrastructure, the promotion of relations with members of the international community, and greater funding for social and economic projects within the Region (gov.krd, 2018).

Engaging actively with the main regional players on a number of issues, including security and economy is not new for the KRG. By and large, the KRG has attempted to circumvent Baghdad by building strong ties with Turkey. The result is that Turkey is the biggest trading partner for the Kurdistan Region (Denise, 2016). The Region is currently exporting almost all of its oil, around 600.000 bpd, via the Turkish port of Ceyhan and the KRG ranks third as Turkey's export destination (Soner & Ege, 2016). In addition, in 2013, approximately 1,500 Turkish companies were operating in the Region, which translated into 65% of all foreign business operating in Kurdistan (investingroup.org, 2018).

Unlike the other governorates in Iraq, the KRG was, for the most part, unaffected by the sectarian fighting and terrorism that exploded following the 2003 US invasion. The termination of UN economic sanctions on Iraq, the end of the Baathist regime's internal sanctions on the KRG, and the formal recognition of the Kurdistan Region in the Iraqi Constitution in 2005 was significant developments for the expansion of the Turkish private sector as the sole vent of Kurdistan economy. The KRG adopted the Bush administration's neoliberal agenda concerning the ease of doing business in the region. Although state socialism still dominated, there was willingness to allow market capitalism to emerge in conjunction with the rise of the oil industry as the economic driver of the economy. The KRG was assured that 17 percent of the Iraqi central budget would, in recognition of their percentage of the total population, be transferred to them by Baghdad. It was these budget transfers that gave the KRG the financial capacity to begin reconstruction of inadequate and damaged infrastructure in its jurisdiction. The recognition of the KRG, as a legitimate governing body, allowed foreign companies to negotiate and sign agreements directly with its agencies.

Kurdistan's oil and gas strategy came to fruition in 2011, just as American troops were preparing to withdraw from Iraq and leave a newly formed Iraqi government in place. In October of that year

Exxon Mobil, signed production sharing agreements with the Kurdistan Region, which included production from Kirkuk and other disputed areas of control. This was significant not only in the potential revenues but it showed the increasing stature of Kurdistan in the international community and would lend legitimacy to Kurdistan's territorial claims as well as independence. Exxon Mobile's confidence was contagious; by July of the following year, Chevron signed contracts, followed by French oil company Total at the end of July and Russian energy company Gazprom Neft in August (Gareth Stansfield, 2013).

Problem Statement and Questions

The aim of this article is to examine Russian's role in ensuring economic security of Iraqi Kurdistan in context of cooperating mutual hydrocarbon sector for supporting economic development of Kurdistan as we know that economic benefits supports political relations. From those questions arises: How to define economic development? What are the underlying conditions of Iraqi Kurdistan economy? How to characterize the relations between Iraqi Kurdistan and Russia in context of economic security? Is the character of Russian giant oil companies working in Iraqi Kurdistan can be characterized as a chance, to Iraqi Kurdistan economic development and security? To accomplish that goal authors have studied the press materials, literature, reports and scientific papers. Research was predicated of analysis of science sources and media and field research, both in Russia and Iraqi Kurdistan in 2015-2018. With observations came conversational interviews with policymakers, Kurdish officers, scientists and investors.

State of society-economic system of entity of that much unfavorable environment can decide of his survival. KRG aim to provide adequate economic growth and strengthen ability to satisfy increasing needs of citizens. Iraqi Kurds are currently dealing with many problems, economic too. Nature of these problems, and their intensity led to multidimensional crisis.

Purpose of the Study

The KRI used its natural resource rents wisely. Contributing around 80 percent of GDP, oil and gas rents are the cornerstone of the KRI economy. Although it is required to export through Iraq proper, direct export deals with global companies like Exxon, Chevron, Rosneft, Gazprom and other companies facilitated billions in capital reserve accumulation. Authorities directed such funds principally into infrastructure rehabilitation and the gentrification of historic Erbil. The purpose of the study is to show the macroeconomic situation of KRG and economic resources of the region, historical and economic relations of the Russian federation for support the energy sector of the KRG with extracting and marketing of the oil and gas. Kurdistan Region in Iraq is the most stabilized territory in that country. It can change without international support. Actions are needed to be taken to improve economic security and development of that Region. Kurds are trying to strengthen ties with world

market and economies of other states. Currently other entities have interests in survival and stabilization of Iraqi Kurdistan.

LITERATURE REVIEW

Economic development is at the same time concept, activity and professional practice. Economic development is not only a topic of popular discussion, but also an activity for which there are great expectations and considerable investment of public funds. Perhaps the only agreement currently is that economic development is difficult to define. However, the definition of economic development is a necessary prerequisite for moving the discussion towards an objective political discussion and solid measures. The first step in defining economic development is to distinguish it from the concept of economic growth. Economic growth has a strong theoretical basis and can be easily quantified as an increase in total production. David Ricardo (1819) and later Robert Solow (1956) and many others see an economy as a machine that produces economic production in response to factors such as work, land and equipment. Growth occurs when performance increases. Output can increase either when we add more inputs or use technology or innovation in order to enhance the efficiency with which we transform inputs into outputs. In part because of this straightforwardness, economic growth, with its emphasis on increases in population, employment or total output dominates the debate, despite the fact that increases in any or all of these could be associated with both improvements and/or declines in prosperity and quality of life.

According to Schumpeter, economic development means a fundamental transformation of the economy. This implies a change in the industrial structure, in the educational and professional characteristics of the population and in the entire social and institutional fabric. While growth is measured by the fact that more people work within an existing economic framework, economic development aims to change that framework so that people work more productively and the economy moves towards higher value activities. While economic growth can be measured quarterly, it may take decades or generations to achieve economic success (Schumpeter, 1961).

With so much at stake, it is necessary to clearly define economic development and consider the underlying logic. Based on a review of the literature, we define economic development as the development of abilities that improve the capacities of economic agents. These actors can be individuals, companies or industries. While the actors have a different perceived potential, it is difficult to foresee or understand the next new idea of how genius can emerge. Unlike a resource-based economy, where the site was limited to natural opportunities, a modern knowledge-based economy depends on the capacity that accumulates over time. Many successful regional economies

have evolved from historical incidents, but luck favors preparation: the ability to benefit from the possibility depends on the underlying skills (Feldman and Francis, 2003).

Michael Porter (1998) says in his highly influential work *The competitive advantage of nations* "Economic development is committed to long-term sustainable development in a standard on the purchasing power parity of a people's living standards" has, as defined Tatyana Soubbotina from the World Bank (2004), could they are "differently equitable and balanced" is referred to, which means that open-ended development must continue to balance the interests of different population groups in three major interrelated areas -economic, social and environmental. "But Porter unfortunately combines economic growth with economic development:" The standard of living is determined by the productivity of an economy on the value of goods and services (products) produced per unit of human capital also and the nation's physical resources. "If economic development is confused with economic growth, then building the private sector are often used uncritically as a means of assessing public investment.

KRG's natural resources and energy policy, as well as its openness to foreign direct investment and its relationship with the world market, have been praised as a positive image of KRG's economic policy (Gunter, 2012 and Bengio, 2010) . The International Crisis Group Report No. 80 (2008), an expert in the region, mentions the conversion of 17% of Iraq's oil revenues into the KRG as the main pillar of the KRG's economic development (Paz, 2011). The KRG claims that its oil reserves are 45 billion barrels, which, if true, is "the sixth largest" oil-rich country. Furthermore, it has "100-200 billion cubic feet of natural gas without oil" (Gunter, 2012). Although not approved by the FGI, KRG has completed about 50 oil contracts with international oil companies (IOC). Another positive indicator for the KRG's economy is openness to foreign investment and commercial capacity with its neighbors, particularly Turkey. Bilateral trade growth between Turkey and the KRG is expected to reach from \$6 billion in 2012 to \$20 billion in 2016 (El Gamal, 2010). Khalil (2009) states that KRG's economic policy is committed to "foreign investment in their region" and is proud to have the "friendliest" investment law in the region. "

RESEARCH METHODS

In order to get a broad range of material, this study has sought to triangulate different sources of material by conducting interviews as well as using different already published/written sources of material in (online) newspaper articles, books, scholarly publications, non/governmental sources and research centers that have dealt with the issues of Kurdish/ Russian. The reason for why material from such a broad spectrum of sources has been collected is because of material from one or a few number

of sources may be biased affecting the reliability and to an extent the validity of the study. However, collecting material from different sources as it has been done in this study, makes the study more transparent and reliable, which in itself will lead to valid and sustainable research outcomes. The research method applied in this study is qualitative and data was sourced by primary and secondary data. Yin (2003) has identified six sources of evidence that work well in qualitative research settings: documentation, archival records, interviews, direct observations, participant observation and physical artifacts. In this research, the most important method data was collected was by documentation, archival records.

KRG MACROECONOMICS VIEW AND THE CRISIS OF THE REGION

The Kurdistan Region of Iraq (KRI) is a semi-autonomous government established in the northern provinces of the Iraqi federal state with an area of 40,643 km² and a population of 5.1 million (estimated in 2012). The KRI has huge reserves of oil (45 billion barrels of oil and about 6 trillion cubic meters of natural gas), which represents about a third of Iraq's reserves and exceeds what Libya has. The KRI is one of the ten richest areas in the world, where the per capita oil reserve indicator is more than 8,800 barrels, more than double than Iraq and even more than Saudi Arabia. Therefore, hence the KRI was named by financial times as “an Ocean of reserves waiting to be tapped”.

According to the World Bank's description, “a stable macroeconomic environment enhances prospects for growth and improved living standards, and besides the ultimate goal of macroeconomics is to avoid uncertainty and risk in economic decision making” (worldbank.org, 2018). In general, macroeconomic policies include taxes, government spending and borrowing, exchange rate determinants, and monetary and credit rules. Dealing with the concept of macroeconomics in Iraqi Kurdistan is a complex issue which has direct influence on the economic growth of the region. The efficiency of macroeconomics in Kurdistan led to rapid economic growth since 2003, which resulted in economic stability, reduced poverty, and improved living standards. It is pointed out that the critical concern in the KRG's macroeconomic measures is complete dependency on oil revenues, and the distribution of wealth, which triggered drawbacks in economic growth rather than a healthy progress for the region. The KRG receives the annual budget from the federal government at the end of every financial year, and the budget for the next year is prepared and approved by the Iraqi Council of Ministries. Continued economic development in the Kurdistan Region is stressed in the recent “regional development strategy for 2012–2016”, in which the 2003-2008 national income increased from IQD 4,373 billion to IQD 35,665 billion, an average growth rate of 46.6% at current prices. In the same period, GDP increased from IQD 2,419 billion to IQD 24,725 billion, an average growth rate of 68.9%. The per capita GDP

income increased from IQD 0.524 million to IQD 4,754 million, representing an average growth rate of 64.3%. The strategic plan for economic development applies a multi-dimensional approach with focus on all factors of economy, as they are interrelated (gov.krd, 2018).

The same report analyzed the economic indicators, which show that based on the available data, in mid-2010, local and foreign investments amounted to about USD 12.491 million, while government investment in the 2004–2009 periods increased by 92.1%, with the government investment expenditures making 25% of the overall public spending in the same period (gov.krd, 2018). Macro-economics in the KRG is highly complex, fragile and burdened with conflicts. In this context, macroeconomics is the driver underlying the conflicts, since the distribution of the wealth of natural resources is contested.

The regional government is weak to overcome the current economic threats in the Kurdistan Region, because the budgetary issues of the Kurdistan Region have always been bargained on by the federal government (Collier & Hoeffler, 2014). The financial crisis hit the Kurdistan Region hard, and the most severe phase of the crisis, which involved in the budget dispute with the federal government of Iraq was dragged for 4 years (2014–2017). Some are of the opinion that the key point is that “a fiscal hole is a fall in availability of budget revenue to fund spending” (IMF, 2018). The current crisis was caused by an unexpected security- and instability-related tension that emerged from the Islamic State of Iraq and Syria (ISIS), also reducing the oil prices and economic stability is very worrying, because the KRG’s economic ability is manipulated by the federal government, to a large extent.

Economic Development Resources of Kurdistan Region

In essence, the KRG economic sector is based on oil revenues which are generated since 2007 by the KRG government independently. “An estimated 45 billion barrels of oil reserves, up to 200TCF of natural gas reserves and relatively unexplored mineral deposits” (IKG, 2013). The Kurdistan region’s energy-related revenues are still untapped, and this makes the Kurdistan region an attractive economic region for the global energy importers. “In 2011, GDP of KRG was over USD 23,6 billion, with a per capita income standing at USD 4,452, and the growth rate being 12% in 2012, predicted to reach 8% in 2013.” (investingroup.org, 2018) The economic sector of the Kurdistan is completely dependent on oil, and this is directly affected by the international oil companies in the region, which are the source of foreign direct investment. It is estimated that “almost 55% of all investment in Iraq is made in Kurdistan region” Despite of that KRG is only able to export almost 400,000 barrels pre-day, which is approximately 16% of the Iraq’s total exports (Frank, 2014).

The eco-natural growth depends on oil revenues, which is risky for a developing region like Kurdistan due to the security situation and the political instability of Iraq and the Middle East. However, since the invasion attracts more foreign investors to invest in Kurdistan rather than in other parts of Iraq. Economically, the KRG is a rich oil dependent region, the same as the federal government, approximately, 95% of the budget depends on oil, in which the revenues share of the oil is calculated and distributed according to the population of the regions, based on this calculation constitutionally, KRG has 17% of the oil share. The Kurdistan region was a hub of foreign investment in the region, with a very peculiar and impressive fast economic development since 2003. Notably, “in 2007, 65% of foodstuffs in the Kurdistan Region was imported, and 35% was produced domestically” (www.trade.gov/KRG, 2008).

Kurdistan Region's Hydrocarbons and Budget Problems with Iraq

Since Iraq's invasion by the United States, the relations between Baghdad and Erbil have changed, are more fragile than before and dispute resolution seems to be pending. The Kurdistan Regional Government adopted its own hydrocarbons law, the oil and gas law of the Kurdistan Region in 2007. Prime Minister Nechirvan Barzani highlighted that this move is a “historic moment” and “together with the Iraqi Constitution, it will be the foundation of our economic development” (KRG, 2007). However, the federal government proclaimed the oil export deals of the KRG to be illegal and unconstitutional. “In January 2014, the KRG started to ship the oil independently to the Turkish port of Ceyhan.” (Presthuis, 2014) Deputy Prime Minister for Energy, Hussein al-Shahristani, pointed out that “the central government had been entrusted with the wealth of the country and cannot remain silent when the Kurdistan Region's oil is being exported without its consent” (www.almonitor.com, 2009). In this respect, the Baghdad–Erbil relationship has a long history of mistrust, and besides, both sides officially blame each other for the ongoing dispute. 2014-2018 were the years of economic crisis in the Kurdistan Region, and currently, the region faces economic difficulties, apparently rooted in the tension between Baghdad and Erbil. Since 2014 the federal government of Iraq has suspended the KRG budget, due to a disagreement between the parties over shares in the oil production in the Kurdistan Region. Basically, this directly affected public servants in the KRG, and jeopardized the KRG's economic stability. Economic downturn in the Kurdistan Region triggered different economic concerns, including unemployment especially in the private sector. “In 2014 in the region almost 100 thousand foreign and local workers have lost their jobs (Shafaq News, 2014).

KRG Economic Development and Geopolitical Impact of Energy

For Iraqi Kurdistan economic security is the key role in realization of Kurds national interests – survival and aiming for independence. In order to make a proper assessment about state of economic security of Kurdistan region in Iraq, one must familiar himself with indicators of this security, which are f. ex. GDP, GDP per capita, or inflation. Official data on this topic is posted on Kurdistan Regional Government in Poland website (Kurdish Regional Government in Poland 2017). On this site we can learn, that Kurdish GDP was tripled from 2006, and in 2015 was at 25, 5 billion dollars. Similar to GDP per capita, which had grown 1400% from 2003, and now it is on 7000 dollar level. Economic growth between 2015 and 2016 was at 8%, unemployment 10%, and inflation 6%. Value of foreign investments is 3 billion \$, and overall value in years 2006-2014 elevate to 41.4 billion \$. Investments projects are calculated to be about 2, 3 billion \$. Labor force stand at 2.1 million people. In GDP of Kurdistan Region in 2013 consist (Sosnowski, 2016): services: 30,1%; public services: 20,6%; agriculture:17,5%; trading and transport:13,5%; mining production:9,4%; construction:7,6%; banking and insurance:1,3%. Also key elements of Kurdish economy are oil and gas resources:

- reported oil reserves stands at 45 billion barrels;
- oil export in 2014 was above 34,5 million barrels;
- reported reserves of natural gas stands at 165 TFC (2015);
- Amount of Kurdish investments in energy sector: 20 billion \$.

Since Iraq and Turkey became divided, Turkey has demanded its share of Iraqi oil, particularly in Kirkuk and the Mosul area as per the Ankara agreement of 1926. When the Soviet Union collapsed and new states emerged in the Eurasia region, oil became part of Turkey's foreign policy decision-making and institutions, in the context of energy security and other strategic considerations. This resulted in a national policy proposal incorporating the Caspian oil pipeline within the framework of Turkish foreign and security policy. Turkish energy security policy will have significant repercussions if converted into reality; possibly, it might reposition Turkey geopolitically. The emergence of Turkey as a significant transit country will arguably give it increased power on the international stage, and it could also mean that the country has more of a stake in geopolitical, regional changes, such as a future independent Kurdistan (Matthew, 2012). Turkey therefore finds itself needing to play a future role regarding the securing of oil to the EU and the international market. For example, the outcome of the Blue Stream gas pipeline that runs from Russia to Turkey has shed light on potential future political games, as well as blackmail factors, with Turkey focused on two major tools regarding security policy

that are central for any state: political and economic gain. Also table 2 shows the Kurdistan oil and gas reserves according to (Paasche, Mansurbeg, 2014):

Table 2. Oil and gas reserves of Kurdistan Region of Iraq

Confirmed reserves of oil	4 billion barrels
Estimated undocumented reserves of oil	45 billion barrels
Confirmed reserves of gas	~ 5753 km ³ (165 TCF)
Possible reserves of gas	~ 1020 km ³ (35.37-38 TCF)

Source: Paasche, Mansurbeg, (2014).

On KRG territory there is searching for energy resources all the time, so data presented in table 2 can grow in time.

KRG AND RUSSIAN FEDERATION ECONOMIC RELATIONS AS DETERMINANT OF KRGS' ECONOMIC SECURITY AND DEVELOPMENT

Russia's New and Historical Relations with the Kurds

Russia's cooperation with the Kurds of Iraq and Syria in the fight against ISIL has been widely publicized by the Western media. However, less well-known is the fact that Russia's relations with various Kurdish groups date back almost two centuries. Russia's southern expansion (from the 18th century on) in search of secure borders and natural resources brought it into contact with different Kurdish tribes. Since then, Moscow has maintained relations with Kurds both inside and outside of its borders. This history forms an important part of Russia's relationship with the Middle East and underscores its unique position between Europe and Asia.

In 1941, wartime allies Britain and the Soviet Union invaded Iran to secure crucial Allied supply lines. At the end of the war, Moscow refused to leave its zone of influence and began to sponsor breakaway republics in Iranian Azerbaijan and Iranian Kurdistan. The latter republic was established at Mahabad in 1946. Qazi Mohammad served as its president, and Mustafa Barzani, the Kurdish rebel leader from Iraq, served as its Minister of Defense. The euphoria of this Kurdish republic was short-lived. Stalin withdrew support after Moscow secured oil concessions from the West. The Mahabad republic was subsequently crushed by Tehran (<http://origins.osu.edu>, 2018).

On September 25, 2017, the Kurds of Iraq held a referendum on political independence from Baghdad, which 92.3% of the population supported. The result provoked an angry response from the Iraqi

central government, supported by Turkey and Iran. The tension culminated in Baghdad's capture of the oil-rich city of Kirkuk.

Russia was restrained in its reaction to the referendum. Although it "respected the national aspirations of the Kurds," it simultaneously encouraged dialogue between Erbil and Baghdad. Significantly, Russia was the only major power that did not call on the Iraqi Kurds to cancel the referendum. In addition to Moscow's historical ties to the Barzani clan, it is the top funder of Iraqi Kurdish gas and oil deals. Russia has emphasized that cooperation in the energy sphere remains unaffected by the referendum. On October 18, Russian energy giant Rosneft signed an energy deal with Iraqi Kurdistan, reaffirming its commitment to the region (<http://origins.osu.edu>, 2018). The Deputy consul-general of the Russia Federation in the Kurdistan Region said Russia would respect the decision of the people of Kurdistan on independence. Evgeny Arzhantsev said that Russia has good relations with the Kurdistan Region, Russia wants to have "good and permanent political relationship with the leadership of Kurdistan," The deputy consul-general said that Russia is working to improve its military relations with the Kurdistan Region. Arzhantsev revealed that Russia delivered four shipments of military assistance to the Peshmerga forces, stating that twice the shipments were sent via Baghdad but the last two shipments were sent directly to the Kurdistan Region. Arzhantsev told Kurdistan24. "This means that we respect Peshmerga fighters who have a big burden on their shoulders to fight Daesh and we respect that Peshmerga forces are fighting on behalf of the world," (Kurdistan24.net, 2016).

According to Reuters, "We are interested that the Kurdish people like any other nation on the planet can fulfill its hopes and aspirations," Foreign Minister Sergei Lavrov said in July. "We start from the fact that the legitimate aspirations of the Kurds, like other peoples, need to be fulfilled within the framework of existing international legal norms." But unlike other powers, Moscow has avoided giving a verdict on the legality or wisdom of holding the referendum itself. The Foreign Ministry in Moscow said it had nothing to add to Lavrov's comments on the matter from July (Reuters, 2017). Russian President Putin said. Russia is going to continue its cooperation with Iraq and Iraqi Kurdistan, he said. "Our companies, including Rosneft, are working in Iraq and Iraqi Kurdistan in particular," the "We believe this cooperation will benefit Iraq at large and Iraqi Kurdistan, and the Russian economy," "We traditionally have very good and trust-based relations with Kurdistan and Kurds in general," Three Russian companies are working on Iraqi fields now - Lukoil, Gazprom Neft, and Bashneft (tass.com,2017).

The Relations of KRG and Russian Federation Companies in Hydrocarbons Industry

The authorities of Iraqi Kurdistan are determined to develop economic relations with Russia, Mahmood Mohammed, the official representative of the Kurdistan Democratic Party (KDP), "We consider that Russian firms have a better understanding of how to invest in our economy than companies from many other countries. That is why we are open for cooperation. There are no obstacles. Kurdistan wants to develop relations based on mutually beneficial cooperation with many countries, and Russia is one of these states," (sputniknews.com, 2017).

On 1 august 2014 Gazprom Neft has begun drilling an exploration well at the Shakal block in Kurdistan (Iraq) and is soon to commence drilling on a second exploration well. The project will study two oil reservoirs in the Shakal block including flow testing. Well testing will be completed by late 2014 / early 2015. Grey Wolf (Canada) has been appointed as contractor for the project based on the company's extensive experience in the region. The wells will have a depth of up to 3.5km. Earlier, 2D seismic surveys have been conducted covering an area of more than 1,000 linear kilometres at the Shakal block, where an exploration well has also been drilled. 3D seismic surveys covering 290 square kilometres have also been conducted since Gazprom Neft joined the project. Gazprom Neft is involved in three projects in Iraqi Kurdistan. In addition to its operations on the Shakal block, the company is conducting geological surveys of the Halabja block where it is planning 2D seismic surveys covering 1,000 linear kilometres in 2014, and drilling the block's first exploration well in 2015-2016. Gazprom Neft is also involved in the development of the Garmian block where the deposit is currently undergoing further exploration and preparation for full scale development. The Kurdistan Regional Government (KRG) is currently considering the initial field development plan (gazprom-neft.com, 2014).

Gazprom Neft is the only Russian company that is currently producing crude oil in the volatile Iraqi region of Kurdistan. In an interview with Company, Sergei Petrov, general director of Gazprom Neft Middle East, explains why the company aims to expand its presence in the region and outlines how existing projects are progressing. When oil prices were high, companies invested in all regions, expanded their presence at very different markets. After the oil price collapse and disappointment in initial geological expectations, companies reconsidered efficiency indexes and reduced the least efficient projects. Gazprom Neft considers its assets portfolio in terms of its long-term economic efficiency. I believe that we have good prospects in the Iraqi region of Kurdistan, and we can get good results on these projects. Also he mentioned Gazprom Neft is active at three blocks. At present, production is carried out on the Garmian Block from the Sarqala-1 well. In February 2016, Gazprom Neft took over operation of the block from its partner, Canadian Western Zagros. Since Mar. 1, 2016, we are the full-fledged project operator. Last year production at Sarqala-1 stood at 3,863 barrels per

day. We started 2017 with daily output of some 5,500 b/d. During this year we managed to significantly increase production to 9,600 b/d. At Garmian, we expect that in the period from 2019-22, production might rise to 1 million tons/yr. We are ready to expand, to look at new blocks. Gazprom Neft is in constant negotiations on the issue with the regional natural resources ministry, which offered us some 10 blocks for consideration. Having studied the available geological data, we chose the most promising license areas and are currently holding negotiations (gazprom-neft.com, 2017).

Speaking about the development of Russia's economic influence in the Middle East after the Arab Spring, it should be noted that Gazprom Neft has recently been the operator of projects in Kurdistan. Economic penetration of Russia assumes reduction of positions of the Arabian countries in oil and gas branches. Russia received observer status with OPEC and participates in current forums of gas-exporting countries since 2008. According to Reuters, Russian state giant oil Rosneft announced its latest investment, to help Iraqi Kurdistan develop its natural gas industry, for domestic supplies and eventual export. The full value of the deal has not been disclosed officially, but according to industry sources familiar with it, it is worth more than \$1 billion. It is Rosneft's third giant venture in the Kurdish region since February, transforming Moscow from an outsider with little profile in Kurdistan into the region's biggest source of cash. According to the industry sources, Rosneft's deals since it first arrived in Kurdistan last December are worth around \$4 billion in total. That exceeds the \$2 billion in financing the Kurdish region has previously received for oil sales from international trading firms that pre-pay for its exports, and \$1.5 billion it has received from neighbor Turkey. It also marks a big change in focus for the Iraqi Kurds, who have had close ties with Washington since 1991 when the United States offered them protection from Saddam Hussein, the dictator later toppled by U.S. forces in 2003 (Reuters, 2017).

Kurdistan has estimated recoverable reserves at 45 billion barrels of oil and 5.66 trillion cubic meters of gas, which could rise further with exploration. In February 2017, Rosneft ramped up its cooperation by agreeing to lend the semi-autonomous region \$1.2 billion, becoming the first big foreign oil company to publicly commit to pre-financing Kurdish exports. Kurdistan's minister of natural resources Ashti Hawrami called the deal a ground-breaker for the region that would help its economic independence - a crucial condition for seeking political independence. Russia became the Kurds' single biggest financier with its next deal in June this year to lend money and help search for more oil, bringing its total investments close to \$2.8 billion. This week's Russian pledge to invest more than \$1 billion in Kurdistan's gas infrastructure could help the region become a major gas exporter to Turkey and Europe one day, Rosneft says. The independence referendum won't be a problem. "Holding the referendum will not affect our work. We are doing business in an autonomous region in Iraq that has

been recognized by law," Rosneft spokesman Mikhail Leontev said. "This place is run by Iraqi Kurdistan's nation and it is the people of Iraqi Kurdistan who live there. That is why we don't think we are embarking on an adventure." (Reuters, 2017).

According to Voanews.com Russian energy major Rosneft has agreed to take control of the main oil pipeline in Iraq's Kurdistan, further boosting its role as the main international investor in the semi-autonomous region. Rosneft said its share in the project may total as much as 60 percent, while the current pipeline operator KAR Group will retain 40 percent. And Rosneft's investment in the project was seen totaling about \$1.8 billion. Iraq, along with neighboring Iran and Turkey, has pledged to isolate Kurdistan in the wake of last referendum. That includes cutting off air and banking ties and reviving an old pipeline to Turkey to deprive Erbil of a big chunk of oil revenues. Rosneft will be investing in expanding Erbil's independent pipeline, which Baghdad has targeted, hoping to boost its capacity by a third to 950,000 barrels per day. That is the equivalent of about 1 percent of total global supply. With Rosneft acquiring 60 percent in the project. Rosneft has already agreed to invest \$400 million in five oil blocks in Iraqi Kurdistan. It also had previously loaned Kurdistan \$1.2 billion, guaranteed by oil sales, and is seeking to help Erbil build two major oil and gas pipelines (voanews.com, 2017).

Rosneft Steps of Deals with KRG

On 21 February 2017, Rosneft and the Kurdistan Regional Government of Iraq signed a Cooperation Agreement in the fields of upstream, infrastructure, logistics and trading. Pursuant to the Cooperation Agreement the parties signed a pre-financed Crude Oil Purchase and Sale Contract of Kurdistan Region Crude oil over the period 2017-2019. The purchaser of crude will be Rosneft's trading arm – Rosneft Trading SA (Rosneft.com, 2017).

On 02 June 2017, Rosneft and the Kurdistan Regional Government, as part of the XXI St. Petersburg International Economic Forum, signed a series of agreements on widening their cooperation in exploration and production of hydrocarbons, commerce and logistics. The documents were signed ahead of the meeting between the President of the Russian Federation Vladimir Putin and the Prime Minister of Iraqi Kurdistan Nechirvan Barzani by Igor Sechin, Rosneft Chief Executive Officer, and Dr. Ashti Hawrami, Minister of Natural Resources for the Kurdistan Regional Government. The Parties signed an investment agreement under which they committed to develop cooperation in exploration and production, agreed on monetization of the export oil pipeline in Iraqi Kurdistan, as well as entered into a number of production sharing agreements. The agreement outlines the main terms of the project which provides for the establishment of a joint venture for implementation of the long-

term contract related to infrastructure systems in Iraqi Kurdistan. Rosneft will get access to the major regional transportation system with the throughput capacity of 700 thousand bbl per day, which is planned to be expanded up to 1 million bbl per day by the end of 2017. The signed documents strengthen cooperation between Rosneft and Iraqi Kurdistan, which started in February 2017 from signing a contract on purchase and sale of crude in 2017-2019. The new agreements will allow to talk about full entry of the Company in one of the most promising regions of the developing global energy market with the expected recoverable reserves in the order of 45 billion bbl of oil and 5.66 trillion m³ of gas (according to the estimate of the Ministry of Natural Resources of Kurdistan Region) (Rosneft.com, 2017).

Also at 18 October 2017, Rosneft and the Government of the Kurdish Autonomous Region of Iraq signed the documents required to put into force Production Sharing Agreements (PSA) with respect to five production blocks located in the Kurdish Autonomous Region. The share of Rosneft Group Subsidiaries in PSA will be 80%, the amount of payments for the projects farm-in and geological information for each of five blocks ranges from 40 to 110 million USD. and may total to 400 mln.USD (incl. 200 mln.USD that can be compensated by oil produced from block), the heads of terms of the agreements and the basic principles of product distribution are similar to the PSA in Iraqi Kurdistan that were signed by other international oil and gas companies. The parties agreed to implement the geological exploration program and to start pilot production as early as in 2018. In case of success, in 2021 it is planned to start full-field development of the blocks. According to conservative estimates, the total recoverable oil reserves at five blocks may be about 670 million barrels. And at 19 October 2017 Rosneft and Kurdistan Regional Government are continuing to build on agreements they have reached previously. On the sidelines of the X Eurasian Economic Forum in Verona the parties have announced the start of joint implementation of an infrastructure project for the operation of the oil pipeline in the Kurdish Autonomous Region. Rosneft's share in the project may amount to 60%. The other project participant with 40% share will be KAR Group, who is the current pipeline operator.

In October, the Company and the Government of the Kurdish Autonomous Region of Iraq signed the documents required for the enactment of Production Sharing Agreements (PSA) for five production blocks with a conservative estimate of recoverable oil reserves of 670 million bbl which are located in the Kurdish Autonomous Region. The key terms of the agreements and the basic principles of production distribution are similar to the PSA in Iraqi Kurdistan that were signed by other international oil and gas companies. On 18 December 2017, in the third quarter of the year, Rosneft successfully closed the deal to enter Essar Oil Ltd, one of the largest Refining, Commerce and Logistics companies operating in India, one of the world's fastest growing markets. The implementation of this

project, as well as gaining an expanded access to substantial crude resources of the Kurdistan and Venezuela fields provided a stable basis for creating additional value through the integrated use of various oil baskets, crude and oil products trading (Rosneft.com, 2017).

CONCLUSIONS

To date, Iraqi Kurdistan has played certain and important role in wars and the world energy market. The positions of the Kurdish elites and Russia are the closest to the fight against the ISIS. Partial coincidence of the positions of Moscow and the Kurds is possible by solving the Kurdish problem and the Iraqi settlement. At the beginning of the 21st century, especially after 2011, Russia emerged from political uncertainty and forms a fairly clear foreign policy strategy; its socio-economic and political situation has reached a new level. In this regard, the Russian influence on the foreign policy level has significantly increased. Political leaders of the leading countries of the world, as a rule, understand that they cannot do without constructive dialogue with Russia in order to realize their own national interests. The current geopolitical interests of the Russian Federation in the Middle East are now being considered in the context of the Kremlin's attempts to change its foreign policy and foreign economic positions not only in the Middle East but throughout the world, which, after the collapse of the Soviet Union of Risk, fell. In the 1990s, the geopolitical influence of the Russian Federation weakened in the Middle East also in the world in connection with what had happened after the collapse of the USSR. Strengthening the positions and the vigilant and economic role of Kurds in the Middle East, especially also in the world, requires Russia to intensify Russian-Kurdish interaction. From the perspective of the Kremlin, the Kurds are a moderate secular force, playing an increasing role in the fight against the ISIS, also in the global energy market that poses a threat to the security interests and geo-economics of Russia. The fight against terrorism and playing a role in global energy are a key area for possible cooperation. Moscow is ready to cooperate with these issues and expand cooperation with all groups of Kurds in Iraq and Syria. Russia will understand and respect the Kurdish aspirations of the Russian Foreign Ministry said during the referendum on September 25, 2017. Thus, at the world level, one of the most important national interests of Russia is active and full participation in the formation of an effective system of international relations that meets its political economic and intellectual capabilities, military-political and foreign economic needs and potential. Kurdistan on the political map of the world occupies a key geopolitical and geostrategic position in the Middle East region. Determining its exact boundaries remains a complex issue to this day due to the absence of a Kurdish state. Kurdistan oil reserves are estimated at 45 to 50 billion barrels (sixth in the world), 60% of the stock of all Iraqi oil is in the territory of Kurdistan.

The logic of economic development requires certain capacities that require collective action through government. For government to be effective in creating economic development there is a need for performance and impact measurement systems that are able to provide decision support for strategic investments, to assess progress made in the catalytic capacity building function, and to assess the limitations and barriers that prevent the utilization of capacity that government investments build. From the literatures presented in this paper we can conclude that the giant oil companies of Russia have signed long term and strategic contracts with KRG in the field of extracting and marketing of oil and gas sector of Iraqi Kurdistan, It will secure economic security and development of the region. The history of Kurds is full of confronting problems by Iraqi government and Turkish frighten in any case, also imposing sanctions regarding extracting and marketing of its hydrocarbon resources. Thus, the Russian factor can reduce the challenges of extracting and marketing of the Region's oil and gas to the international markets, that's why securing the political security and economic development of the region. In the context of mutual benefits of oil industry between them, the Russia can protect Kurdistan Region from the threaten faced by Iraqi government and neighbors countries (Iran, Turkey) that have Kurdish problem in their countries, regarding imposing sanctions on the economic development of the Region for preventing independence economic development and self governance.

The West punishes Kurds for agreements with Rosneft and Gazprom, but the leadership of Kurdistan has made the right decision by signing agreements with Russian companies". Further economic cooperation with Russia should be developed, and in the future, if possible, the two party's investors should invest mutually, too. But anyway, it can be said that the prevailing circumstances in Kurdistan provide an opportunity for Russia to catch up on the Kurds. And with a reasonable approach, and the ability to balance Russian foreign policy, which will not damage Russia's relations with the countries of the region, and even vice versa. We note that this approach is very rational at this stage of the development of Russian-Kurdish relations. Former President Kurdistan M. Barzani once argued that there will be a serious reworking of relations with the United States. According to him, Russia's position was friendlier for Iraqi Kurds than Washington's position on the referendum and independence.

**PERFORMANCE INDICATORS AND CLINICAL MONITORING:
USEFUL MEASURES FOR IMPROVING QUALITY AND REDUCING
COSTS IN HEALTHCARE ORGANIZATIONS**

ABSTRACT

In the last few years, increasing attention was captured by the question related to evaluating the performance and to monitoring the clinical activity in the healthcare organizations. Besides to show how accreditation and certification processes have to be performed, recent researches assess the healthcare performance in order to check their efficiency and effectiveness. Such capability is described as the competence to contribute with treatments improving the patient's health.

This study, dealing with scientific and technological developments, screening programs and well-defined indications for accessing to minimally invasive surgery, focuses on techniques for identifying, through a clinical audit process, the criteria and key performance indicators useful for assessing whether the indication for minimally invasive endovascular surgical treatment was performed in the right way. The research, after having introduced readers to the wide contest on measuring strategies, performance, outcomes indicators and clinical monitoring, aims attention at the clinical audit involving to explain the concept of quality of care in the vascular and endovascular surgery area. Sub-objectives were: (1) verify if according to the evidence-based recommendations, the indication for minimally invasive treatment for EVAR and TEVAR is appropriate; and (2) evaluate the performance of minimally invasive treatment. The results will be able to guide professionals to prescribe the right care to the patient and reduce costs. In conclusion, to confirm the feasibility of performance indicators and clinical monitoring, a practical application defining criteria and indicators for evaluating the indication for the minimally invasive treatment and for assessing the performance of the procedure is proposed.

Keywords: healthcare organization; performance indicator; performance improvement; health performance; clinical audit; healthcare costs; quality of care.

INTRODUCTION

The development and use of methodologies making measurable the actions implemented by health professionals, has now become an increasingly widespread issue in healthcare organizations (Smith, 2009). In healthcare practice, clinical indicators are part of performance measurement, a mode for assessing the quality of care by investigating the frequency of specific results. Instituting measures for the use of constant performance monitoring and the consequent enhancement, has evolved into a fundamental element of healthcare in most organizations worldwide (Braithwaite, 2017).

The right identification of the quality measures represents one of the most important factors in the entire process of clinical monitoring (Morris and Bailey, 2014). Unfortunately, one single indicator cannot represent the general concept of quality of care, since it has a multidimensional approach. To confirm this, several authors have shown the usefulness to adopt a multidimensional approach to evaluate the performance (Keegan *et al.*, 1989; Azzone *et al.*, 1991; Lynch and Cross, 1991; Kaplan and Norton, 1992; Brown 1996; Neely *et al.*, 2001, Awwad and Akroush, 2016). In particular, the Donabedian' approach (1988) splitting the performance concept into "structure – process – outcome" areas, represents for most of the scholars the quality-oriented measurement system more used (Kennedy *et al.*, 1999; Lindsay *et al.*, 2002).

According to Donabedian, for each area a cluster of indicators should be used to get accurate assessments. Since such indicators are used in several areas to cope the requests of different stakeholders, the choice of one rather than another, has to be related to the aim of the analysis. Furthermore, the outcomes indicators representing the last step of the healthcare analysis, may not be useful to identify aspects that have implications for performances. In this case, to know what affects performance, an efficient index should measure not only the final findings but also the care processes as a whole (Braithwaite, 2017; Ibrahim, 2001). In a performance management vision, the clinical processes have to be connected with enhanced patient health results. This expectation is ensured applying process measures than outcomes measures as they give the opportunity to the health professionals to assess exactly which procedures are necessary follow to positive affect patient outcomes (Burton, 2014).

Nowadays, a greater awareness of quality and safety topics has implemented the improvement of clinical indicators for healthcare governance, services, patient safety as well as particular disease. Such measures are collected from healthcare administrative sectors and the clinical audit has to develop and check a range of indicators. The improvement process requires continuous measurements for evaluating health care. In order to reach the desired optimal result, such approach is then compared with good practices identified on scientific evidence (Dixon, 2001).

Clinical audit is a process that involves all healthcare professionals. Through a systematic review of clinical practice, they try to improve the quality of patient management. Constant monitoring of the indicators is carried out to confirm or reject the improvement of the healthcare system (Dixon, 2001).

BACKGROUND AND SCIENTIFIC RATIONALE

Healthcare organizations are constantly evolving in response of today's and future health sector challenges (Saviano *et al.*, 2014). The main issues are the resources' cutbacks; population ageing; technological innovation with increasingly expensive investments and lastly the rising demand for quality healthcare (Aggelidis and Chatzoglou 2008; Lega *et al.*, 2013). Such aspects, producing both an increase in the quality of services and an increase in expenses, lead healthcare organizations to spend time and resources to develop correct measurement systems to evaluate how care is provided. Healthcare management seeks to identify the appropriate key performance indicators (KPIs) to quickly find useful information about the various activities. The indicators are fundamental for any clinical audit process.

The study, through a clinical audit process, defines the criteria and KPIs for minimally invasive endovascular surgical treatment. Such treatment is chosen because among the diseases of the cardiovascular system, aortic pathologies represent an important European health problem (ESC, 2014; ISTAT, 2017; Pratesi *et al.*, 2016; Speziali *et al.*, 2015). The Italian Society of Vascular and Endovascular Surgery has detected about 84,000 people suffering from abdominal aortic aneurysms and 27,000 cases are diagnosed each year (Pratesi *et al.*, 2016; Speziali *et al.*, 2015). Repair of an aneurysm may be performed in two ways: traditional surgery (open repair) or through the endovascular prosthesis with a minimally invasive procedure.

The minimally invasive procedures "EndoVascular Abdominal Aortic Repair" (EVAR) and "Thoracic Endovascular Aortic Repair" (TEVAR), replacing the traditional surgery, reduce surgical and post-surgical risks (Saqib *et al.*, 2012; Wang and Fairman, 2009).

Among field studies, Powell *et al.*, (2017) has proved how the minimally invasive cardio-surgical treatment is associated with a 66.7% reduction of: perioperative mortality, complications' rate and hospital recoveries compared to traditional surgical treatment (Hiratzka *et al.*, 2013; Patel *et al.*, 2018; Patel *et al.*, 2016).

In recent years, scientific and technological developments, screening programs and well-defined indications for accessing to minimally invasive surgery, have shed light on the increase in the economic burden on the healthcare system and on the constant raise in cardio-surgical treatments (ESC, 2014; Pratesi *et al.*, 2016; Speziali *et al.*, 2015).

Statistically, in 2017 the use of abdominal thoracic aorta prostheses (systematic surgical codes: 39.71, 39.73, 39.79) increased compared to the previous year. In the field studies, cost monitoring has highlighted an increase in vascular prosthesis procedures, generating 10% increase in costs and 75% increase in budget compared to 2016. Such budget using has taken into account the use of more expensive custom-made system than the standard system. The data showed that in the case of custom-made systems, the costs of medical devices exceeded the DRG tariff rate which should remunerate all hospitalization costs. Given the increase in activities and costs of surgery' medical devices, a clinical audit was scheduled in order to gather more information on the way in which the activities are carried out.

OBJECTIVES

The principal aim was to identify, through a clinical audit process, the criteria and KPIs useful for assessing whether the indication for minimally invasive endovascular surgical treatment was performed in the right way.

Such main objective was split into two sub-objectives:

1. verify if according to the evidence-based recommendations, the indication for minimally invasive treatment for EVAR and TEVAR is appropriate;
2. evaluate the performance of minimally invasive treatment for EVAR and TEVAR;

The results will be able to guide professionals to prescribe the right care to the patient, thus generating a positive impact both for patients in terms of better quality of care and for the healthcare organization in terms of savings.

METHODOLOGY

Study Design

In the preliminary phase a literature review was carried out. Using the PubMed database the national and international guidelines have been identified. The keywords: "Abdominal Aortic Aneurysm", "Toracic Aortic Aneurysm", "Endovascular Aortic / Aneurysm Repair"; "Thoracic Endovascular Aortic / Aneurysm" and the following limits: "English, Italian, studies published in the last 3 years, Humans, Practice Guidelines" were used as inclusion criteria. The identified guidelines were subsequently submitted to an evaluation following the criteria defined by Grilli *et al.*, (2000).

The "Guidelines on the diagnosis and treatment of aortic diseases of the European Society of Cardiology" (ESC, 2014) was considered the best guideline. Furthermore, in order to consider the applicability in the context of the Italian health system, some recommendations such as: "Patologia

aneurismatica dell'aorta infrarenale, aneurismi viscerali e aneurismi periferici" (Pratesi *et al.*, 2016) and "Trattamento delle patologie dell'aorta toracica e toraco-addominale" (Speziali *et al.*, 2015) were included.

The sample was built on the basis of various health information sources. The data was recorded and processed with the STATA statistical software version 24.0.

Population

The sample's inclusion criteria were:

- adult patients with an indication for elective or urgent surgical treatment;
- patients who have an endovascular graft implant operation with ICD9-CM: 39.71, 39.73, 39.79, divided by aneurysm size, type of graft and surgical unit.

The sampling was carried out considering a 90% confidence interval with a margin of error of $\pm 10\%$.

On a total of 160 patients, 53 patients were considered eligible.

Criteria, monitoring and key performance indicators

In order to cope the first sub-objective, verify if according to the evidence-based recommendations, the indication for minimally invasive treatment for EVAR and TEVAR is appropriate, 9 criteria of which 5 related to the abdominal area and 4 to the thoracic area were defined. Indicators and criteria are shown in Tab. 1.

As for the second sub-objective, evaluate the performance of minimally invasive treatment for EVAR and TEVAR, 8 indicators were identified (Tab. 2).

ABDOMINAL AREA		
indication for minimally invasive treatment for EVAR		
Criterion 1		Patients enrolled to a Abdominal Aortic Aneurysm (AAA) treatment with favorable anatomy and a high surgical risk due to perioperative complications are submitted to EVAR surgery (ESC, 2014; Pratesi <i>et al.</i> , 2016).
Indicator	Numerator	The number of patients with indication for AAA surgery, high surgical risk and favorable anatomy.
	Denominator	All patients submitted to EVAR surgery with indication for AAA, high surgical risk and favorable anatomy.
Criterion 2		Patients enrolled for AAA treatment with favorable anatomy and a medium or low risk due to perioperative complications are submitted to EVAR or OPEN surgery (ESC, 2014; Pratesi <i>et al.</i> , 2016).
Indicator	Numerator	The number of patients with indication for AAA surgery, medium or low surgical risk and favorable anatomy.
	Denominator	All patients submitted to EVAR surgery with indication for AAA, medium or low surgical risk and favorable anatomy.
Criterion 3		Patients enrolled for AAA treatment with NO favorable anatomy for EVAR are submitted to OPEN surgery. If the risk of perioperative complications is high, medical therapy is indicated (ESC, 2014; Pratesi <i>et al.</i> , 2016).
Indicator	Numerator	The number of patients with indication for AAA surgery

		and NO favorable anatomy for EVAR.
	Denominator	All patients submitted to EVAR surgery with indication for AAA.
Criterion 4		Patients enrolled for broken or symptomatic AAA with favorable anatomy are submitted to EVAR surgery if the risk of perioperative complications is high and the structure is adequate (minimum 50 surgery per year) (ESC, 2014; Pratesi et al., 2016).
Indicator	Numerator	The number of patients with indication for broken or symptomatic AAA, high surgical risk and favorable anatomy.
	Denominator	All patients submitted to EVAR surgery with indication for broken or symptomatic AAA and high surgical risk.
Criterion 5		Patients enrolled for broken or symptomatic AAA with NO favorable anatomy for EVAR are submitted to OPEN surgery (ESC, 2014; Pratesi et al., 2016).
Indicator	Numerator	The number of patients with indication for broken or symptomatic AAA and No favorable anatomy for EVAR.
	Denominator	All patients submitted to EVAR surgery with indication for broken or symptomatic AAA.
THORACIC AREA		
indication for minimally invasive treatment for TEVAR		
Criterion 6		Patients with chronic dissection associated with connective tissue disorders, aneurysm > 5.5cm and without severe comorbidity are submitted to OPEN surgery (ESC, 2014; Speziali et al., 2015).
Indicator	Numerator	The number of patients with indication for Abdominal Thoracic Aorta Aneurysm (ATA), aneurysm > 5.5cm and without severe comorbidity.
	Denominator	All patients submitted to TEVAR surgery with indication for ATA.
Criterion 7		Patients with ATA associated with connective tissue disorders and aneurysm > 6cm or less if associated with Marfan or LoyezDietz pathology are subjected to OPEN surgery (ESC, 2014; Speziali et al., 2015).
Indicator	Numerator	The number of patients with indication for ATA associated with connective tissue disorders and aneurysm > 6cm or less if associated with Marfan or LoyezDietz pathology.
	Denominator	All patients submitted to TEVAR surgery with indication for ATA.
Criterion 8		Patients with ATA associated with connective tissue disorders and aneurysm > 6cm or less if associated with Marfan or LoyezDietz pathology, are subjected to TEVAR surgery if there is a high perioperative risk (ESC, 2014; Speziali et al., 2015).
Indicator	Numerator	The number of patients with a high perioperative risk and indication for ATA associated with connective tissue disorders and aneurysm > 6cm or less if associated with Marfan or LoyezDietz pathology.
	Denominator	All patients submitted to TEVAR surgery with high surgical risk and indication for ATA.
Criterion 9		Patients with an abdominal or traumatic thoracic aortic aneurysm, saccular aneurysms, or post-operative pseudoaneurysms are subjected to TEVAR surgery (ESC, 2014; Speziali et al., 2015).
Indicator	Numerator	The number of patients with indication for ATA associated

		with traumatic or aneurysm > 6cm or saccular aneurysms, or post-operative pseudoaneurysms.
	Denominator	All patients submitted to TEVAR surgery with indication for ATA.
THORACIC-ABDOMINAL AREA		
OUTCOMES - EVAR /TEVAR – DIVIDED INTO OPERATIVE UNITS, PROCEDURE AND GRAFT TYPE		
Indicator 1: Intraoperative mortality	Numerator	The number of patients died during EVAR or TEVAR surgery
	Denominator	All EVAR or TEVAR surgery
Process RESULTS - EVAR /TEVAR – DIVIDED INTO OPERATIVE UNITS, PROCEDURE AND GRAFT TYPE		
Indicator 2: average duration of hospitalization	average and range	Average hospitalization days for EVAR or TEVAR surgery
Indicator 3: average duration of surgery (minutes)	average and range	End of surgical operation - Start of surgical operation for EVAR and TEVAR
Indicator 4: Type of anesthesia - general / local	Numerator	The number of patients with indication for EVAR or TEVAR surgery under general / local anesthesia
	Denominator	All patients with indication for EVAR or TEVAR surgery
Indicator 5: average duration of hospitalization in intensive care unit (days)	average and range	Average stay in intensive care unit after EVAR or TEVAR surgery.
POST-OPERATIVE COMPLICATIONS - EVAR /TEVAR – DIVIDED INTO OPERATIVE UNITS, PROCEDURE AND GRAFT TYPE		
Indicator 6: repeated	Numerator	The number of patients with indication for EVAR or TEVAR surgery who had an episode of surgical re-

surgery		intervention in the current hospitalization.
	Denominator	All patients with indication for EVAR o TEVAR surgery.
Indicator 7: conversion rate	Numerator	The number of patients with indication for EVAR or TEVAR surgery who had a switching episode to OPEN surgery during the hospitalization.
	Denominator	All patients with indication for EVAR o TEVAR surgery
Indicatore 8: endoleak complications	Numerator	The number of patients with indication for EVAR or TEVAR surgery who had an endoleak following or prior to surgery.
	Denominator	All patients with indication for EVAR o TEVAR surgery

Table 1. *criteria and indicators for evaluating the indication for the minimally invasive treatment EVAR and TEVAR (sub-objective 1).*

THORACIC-ABDOMINAL AREA		
OUTCOMES - EVAR /TEVAR – DIVIDED INTO OPERATIVE UNITS, PROCEDURE AND GRAFT TYPE		
Indicator 1: Intraoperative mortality	Numerator	The number of patients died during EVAR or TEVAR surgery
	Denominator	All EVAR or TEVAR surgery
Process RESULTS - EVAR /TEVAR – DIVIDED INTO OPERATIVE UNITS, PROCEDURE AND GRAFT TYPE		
Indicator 2: average duration of hospitalization	average and range	Average hospitalization days for EVAR or TEVAR surgery
Indicator 3: average duration of surgery (minutes)	average and range	End of surgical operation - Start of surgical operation for EVAR and TEVAR
Indicator 4: Type of anesthesia - general / local	Numerator	The number of patients with indication for EVAR o TEVAR surgery under general / local anesthesia
	Denominator	All patients with indication for EVAR o TEVAR surgery
Indicator 5: average duration of hopitalization in intensive care unit (days)	average and range	Average stay in intensive care unit after EVAR or TEVAR surgery.
POST-OPERATIVE COMPLICATIONS - EVAR /TEVAR – DIVIDED INTO OPERATIVE UNITS, Procedure AND GRAFT TYPE		
Indicator 6: repeated surgery	Numerator	The number of patients with indication for EVAR or TEVAR surgery who had an episode of surgical re-intervention in the current hospitalization.
	Denominator	All patients with indication for EVAR o TEVAR surgery.
Indicator 7: conversion rate	Numerator	The number of patients with indication for EVAR or TEVAR surgery who had a switching episode to OPEN surgery during the hospitalization.

	Denominator	All patients with indication for EVAR o TEVAR surgery
Indicatore 8: endoleak complications	Numerator	The number of patients with indication for EVAR or TEVAR surgery who had an endoleak following or prior to surgery.
	Denominator	All patients with indication for EVAR o TEVAR surgery

Table 2. indicators for assessing the performance of the minimally invasive procedure (sub-objective 2).

RESULTS

According to the inclusion criteria, the sample of 53 eligible patients was defined. 51% of patients submitted a minimally invasive EVAR surgery. 96% were male patients and 77% of participants in the age group 60-79 years. The size of the aneurysm was ≥ 5 cm in 78% of cases, of which 71% is male in the age group 60-79 years. As for TEVAR surgery, 47% of patients submitted for the treatment. 72% were male in the age groups 40-59 years (28%) and 60-79 years (44%).

Sub-objective 1: Indication to the intervention EVAR or TEVAR

To cope the sub-objective 1, criteria and indicators exposed in Tab. 1 were used. The results are shown below.

Abdominal area

Criterion 1: 60% of patients with favorable anatomy and high surgical risk due to surgical complications, was submitted to EVAR surgery. The remaining 40% does not meet the criterion for the EVAR surgery indication, as in 2 cases it was not possible to find information and in 2 other cases the CT Angiography (CTangio) was not favorable to the surgical intervention.

Criterion 2: 100% of patients with favorable anatomy and medium-low surgical risk due to surgical complications, was submitted to EVAR surgery.

Criterion 3: 8% of patients with no favorable anatomy and high surgical risk due to surgical complications, was submitted to EVAR surgery.

Criterion 4: 100% of patients with aneurysm of the broken or symptomatic abdominal aorta, favorable anatomy and high surgical risk due to surgical complications, was submitted to EVAR surgery.

Criterion 5: No patient with aneurysm of the broken or symptomatic abdominal aorta, no favorable anatomy and high surgical risk due to surgical complications, was submitted to EVAR surgery.

In the tabs 3 and 4 the criteria and indicators applied to the abdominal area are shown.

DIAGNOSIS	SURGICAL RISK (HIGH MEDIUM LOW)	CT angiography (0)	CT angiography (1)	NA	TOTAL

Table 4. *criteria and indicators – abdominal area**Thoracic area*

Criterion 6: No patient with chronic dissection associated to connective tissue disorders, aneurysm > 5.5 cm, no severe comorbidity and no favorable anatomy, was submitted to TEVAR surgery.

Criterion 7: No patients with ATA associated to connective tissue disorders and aneurysm > 6cm or less if associated with Marfan or LoyezDietz pathology, was submitted to TEVAR surgery.

Criterion 8: No patients with ATA associated to connective tissue disorders and aneurysm > 6cm or less if associated with Marfan or LoyezDietz pathology and high surgical risk due to surgical complications, was submitted to TEVAR surgery.

Criterion 9: 80% of patients with saccular aneurysms, or post-operative pseudoaneurysms, was subjected to TEVAR surgery.

In the tabs 5 and 6 the criteria and indicators applied to the thoracic area are shown.

Sub-objective 2: Evaluation of the performance of minimally invasive treatment' performance for EVAR and TEVAR surgery

In the following tables, the results of the indicators applied as defined in tabs 1 and 2 are shown. The evaluation of: the average Duration of Hospitalization (DH-average) (Tab. 7), the average Duration of Surgical Intervention (DSI-average) (Tab. 8), the type of anesthesia (Tab. 9), the average Duration of Hospitalization in Intensive Care Unit (DICUaverage) (Tab. 10), the access to Intensive Care Unit (ICU) (Tab. 11), the surgical re-interventions (Tab. 12), endoleak complications (Tab. 13) are presented below with a brief discussion of significant results.

The DH-average was 8 [3-19] days in the EVAR surgery, was 11 days [4-25] in the TEVAR surgery. The overall result of both treatments was 9 days [3-25] of DH-average (Tab. 7).

CONCLUSION AND FUTURE DIRECTIONS

The study provides useful support to healthcare organizations by developing and implementing effective performance measurement systems in order to improve the quality of care provided. Clinical audit processes based on appropriate indicators can effectively support healthcare management. It was decided to analyze the minimally invasive endovascular surgical treatment because it represents a critical performance in terms of costs and outcome quality for many healthcare organizations in

industrialized countries. The results of the research can address towards an appropriate indication of the minimally invasive procedure, generating benefits both for the patient and for healthcare organizations.

As mentioned in the literature (Brown *et al.*, 2012; Patel *et al.*, 2016) the results of the minimally invasive procedure compared to traditional surgery (open repair), show a reduction in hospitalization time, surgical intervention time, hospitalization in intensive care unit and a complete elimination of intraoperative mortality. Such elements should be quantified considering the burden of the endoprosthesis costs. Furthermore, a complete absence of early endoleaks complications and surgical re-interventions during the same hospitalization was identified in the study. These benefits are to be considered in reference to a life expectancy, quality of life and complications that appeared only in the short term. Indeed, it takes years to define if the surgical intervention of repair of an aortic aneurysm has been effective and has avoided subsequent accesses to the emergency room or subsequent hospitalizations due for example to the new intervention for the endoprosthesis repositioning.

In light of the above, the clinical audit showed that continuous monitoring to be recorded in an internal database, would be desired. Mortality should be detected not only during the intervention, but also in subsequent medium and long-terms.

A critical element in identifying useful information for the correct indication to minimally invasive treatment, was to define the patient's operative risk. The lack of a score as a reference index has made the information collection complicated. The advice given by the clinical audit would be to use a unique score for the evaluation of the operative risk. To this end, the EuroScore could be considered, but the literature asserts that it is scarcely used in the clinical-assistance documentation (Patel *et al.*, 2018; Corio *et al.*, 2013).

GLOBALISATION PROPENSITY OF TRANSITION LEADERS: PUSH AND PULL FACTORS

Samardžija, Jasminka

RIT Croatia, Zagreb, Croatia

ABSTRACT

The purpose of this paper was to detect which motivational “push” and “pull” factors are influencing globalization propensity of transition leaders, and to analyse to what extent certain motivational push and pull factors influence higher or lower globalization propensity. The method used was personal interviews with Croatian leaders of different ages, both genders coming from a variety of fields. Based on the collected inputs, and in order to get the quantitative data the questionnaire was created, and distributed to all 100 respondents (face-to-face, as well as online via Google Form). According to the research findings the higher the dissatisfaction with career development potential, opportunities for making gain and profit, as well as standard of living the more expressed the globalization orientation of transitional leaders. The global tendency, and behaviour was additionally amplified by loss of employment, but also support of closest associates. On the other hand, subjective characteristics manifested through passion and love towards ones work, and the desire for self-assertion, realization of personal idea, the desire to raise the level of living standard, attracted more forcefully transitional leader towards globalization.

Keywords: Globally oriented leaders, transition leaders, globalisation propensity, career development, intrinsic and extrinsic variables

INTRODUCTION AND THEORETICAL RATIONALE

Based on the limitation of the previous two papers (Samardzija 2016, 2017) the purpose of this paper was to detect which are motivational “push” and “pull” factors influencing globalization propensity of transition leaders, and to analyse to what extent certain motivational push and pull factors influence higher or lower globalization propensity. More specifically the goals was to understand how the typical value of the created dependent variable (or 'criterion variable') *Globalization propensity* changes when any of the independent variables is varied, while the other independent variables are held fixed. Therefore, the basic research questions of this study are: “Which are motivational “push” and “pull” factors influencing globalization propensity of transition leaders?”, and “To what extent certain motivational push and pull factors influence higher or lower globalisation propensity?”

Framework for hypothesis development

Based on the previous research conclusions (Samardžija 2016) applied cluster analysis procedure of general leadership characteristics singled out three clusters Moderates, Internalists and Globalists. It is indicative that 53.6% of all leaders' respondents belong to the Globalist cluster mostly focused on international collaboration and leaders within that cluster think that they are able to learn from international praxis a lot and subsequently applying modified international business praxis to the Croatian market, a result of their belief is that foreign markets have an extreme influence on their businesses. These leader experience their leadership as a dispositional social role. On the other hand it is valuable to note a huge potential of leaders that belong to the so called Internalist cluster (23.7%). If leaders who belong to Internalist cluster would open their minds to the external, world praxis and enable international markets to influence their daily business that could improve self-perception of Internalists cluster, what could subsequently lead them to Globalist mindset, what would have a positive impact on their business, but also overall economic performance.

Additionally, according to the Samardžija (2017) study the most important factor of transition leaders' career development is to achieve self-assertion. The factor analysis has clearly ranked five latent dimensions percentage of the total variance: 1. Acquisition and presentation of wealth (27.4%), 2. Life satisfaction (18.2%), 3. Economic importance (10.1%), 4. Satisfaction with human relationships (7.1%), 5. Impact on society and policy (5.4%). Significantly lower 10.1% of varying of all results which goes towards economic importance was manifested with following variables: "The market share of our services and products" and "The number of foreign markets that company is present at."

Therefore we can conclude that Croatian leaders who have undergone a transition process are mainly characterized by intrinsic components, the desire for self-assertion and affirmation of personal creativity and after that comes a significantly lower impact of external motivation component of classical capitalism such as attraction and desire for making gain and profit and consequently raising the social status.

In order to answer the main research questions of this study: "*Which are motivational "push" and "pull" factors influencing globalization propensity of transition leaders?*", and "*To what extent certain motivational push and pull factors influence higher or lower globalisation propensity?*" the following four hypotheses were developed:

H0: Croatian transition leaders do not have globalisation propensity.

H1: Transitional leaders are differently influenced by push and pull factors.

H2: Push factors have stronger influence on transition leaders.

H3: The most important push factor is "loss of employment".

LITERATURE REVIEW

Since 1990s many businesspeople and scholars exchanged term international with the adjective global when describing organizational and leadership strategies, thinking, and behavior. Overall unity in global markets, global communication, global knowledge sharing, global supply chains, global marketing, global careers, and global finance created need for global leaders (Bird, A., & Mendenhall, M. E., 2016). However, the competition also became global, and sharper than ever, and the global leaders were about to step on the scene. Accordingly, corporate world (Ghemawat, 2012; Reiche, 2015), but also academic society (Adler, 2001; Mendenhall, Reiche, Bird, & Osland, 2012) demonstrated rising interest for characteristics of global leadership. Doing global business requires reduced ethnocentrism, greater cultural flexibility, collaboration and coordination among people from different cultures. Cultural flexibility is positively related self-confidence and self-esteem and (Mendenhall & Oddou, 1985) which helps in adapting to the foreign environments. We can conclude that the presence of higher level of cultural flexibility can enhance effectiveness of global leaders when they are living and working internationally for extended periods of time or if they collaborate with international business partners. Although there is a growing number of researches based on the global leadership (Osland, Li, & Mendenhall 2017) there are still very few theories in the field of global leadership. Shakir and Lee (2017) model advances the constructs of both interpersonal connections and multiculturalism. Global leadership typology by Reiche, Bird, Mendenhall, and Osland (2017) derived four ideal-types of global leadership roles based on the two foundational dimensions of task and relationship complexity: Integrative Global Leadership, Connective Global Leadership, Incremental Global Leadership, and Operational Global Leadership. According to the mentioned model Croatian global leaders, are, placed in Connective global leadership type which emphasises low task complexity, and high relation complexity. Other recent theoretical models in the global leadership field provide propositions that can be empirically tested include those of Herman and Zaccaro (2014), and Clapp-Smith and Lester (2014). Another research Caligiuri and Tarique (2012 p.1) “found a combined effect of personality characteristics (extraversion, openness to experience, and lower neuroticism) and cross-cultural experiences (organization-initiated cross-cultural work experiences and non-work cross-cultural experiences) as predictors of dynamic cross-cultural competencies (tolerance of ambiguity, cultural flexibility, and reduced ethnocentrism).” Apart from that, Huesing and Ludeman (2017) study of global leaders at work identified 10 characteristics of global leaders’ work among others functional expertise with global scope, and long working hours. According to Vogelgesang Lester, G., Palanski, M., Hammond, M., & Clapp-Smith, R. (2017. p. 135) “the foundation of leader identity is provided very early in life from experiences in school, groups, sports, and family dynamics—in other words, in a multi-domain context.”

Findings of Erkutlu, H. V., & Chafra, J. (2017 p.146) showed a “significant negative relationship between leader narcissism and subordinate embeddedness, and point out the importance of reinforcing an ethical context as well as the importance of leader selection.” According to Khodabandehloo, A. (2014 p 149.) “An effective network requires a process leader who promotes trust and mutuality, and pushes the network in the desired direction”. Global context is inevitable for any future leader, and organizations are responsible for identifying, attracting, developing and retaining individuals with the global leadership ability and motivation and international experience Beechler & Javidan, 2007; Caligiuri & Tarique, 2009, Caligiuri and Tarique 2012). Study suggests that developmental cross-cultural experiences occur through both work-related and non-work activities, but the beginnings can also be found in family, and friends related international experiences. Enhancing global orientation and collaboration is critical for effective global leader multiplier effect.

DATA AND METHODOLOGY

Firstly, extensive personal interviews with 100 leaders across Croatia were conducted (Samardžija, 2013). The idea was to interview different Croatian leaders of all ages, both genders, working in small and big businesses. Since the idea was to cover a wide range of different fields of business, the research sample included not only residents of the entire Croatian region but also exceptional expatriates (Table 1). Based on the collected inputs, and in order to get the quantitative data, the questionnaire was created, and distributed to all 100 respondents. Combination of questionnaires distributed face-to-face, as well as online via Google form was used. The response rate was 95%. The first part of the questionnaire was a forty-two item, seven-point side-by-side matrix scale ($\alpha=0.93$). The bipolar descriptions used, represent optimal leaders' characteristics and their opposites. The second pool of 44 leadership characteristics questionnaire (Cronbach's Alpha $\alpha =.93$) was created using an inductive approach. All of the 44 descriptive adjective pairings of personal leadership characteristics were empirically derived from face-to-face life interviews with 100 Croatian leaders as well as corresponding notes and voice recordings of the interviews (Samardžija, 2013). The second component of the second part of the leadership questionnaire asked respondents to rank indicators of one's success (11 items, $\alpha=0.74$), and a ranking item in which leaders were required to rate on a scale from 1-5 the importance of factors relevant for personal success.

Gender	Female	55,4 %
	Male	44,6 %
Age	18-29	18,8%
	30-39	29,7%
	40-49	32,7%
	50-59	11,9%
	60 and more	6,9%
Activity – field of interest	architecture and building	5
	banking	7
	distribution & trade	9
	media & publishing	10
	researchers & inventors	6
	industrial production	9
	non – profit organization	4
	food industry	10
	sport	11
	tourism & gastronomy	5
	art	12
science & education	12	
Did you establish the company you work for?	Yes	26%
	No	74%
Where did you grow up?	City with a population greater than a million	4,9%
	Town	48%
	Smaller place	4,9%
	Village	12,7%
	Hamlet	11,8%
	Other	8,9%
How many times have you moved/changed place of residence?	Once	27,5%
	Twice	29,4%
	Three times	19,6%
	Four times	10,8%
	Five or more times	12,7%

RESULTS AND DISCUSSION

In order to expand the previous research based on the globalist perspective, the goal of this study is to additionally investigate motivational push and pull factors influencing globalization propensity of transition leaders, as well as the intensity of the each separate factor. While answering research questions the regression analysis with focus on the relationship between a set of independent variables "predictors", and one dependent "composite" - criterion variable was used in order to test if specific factors having predictor character, are demonstrating statistically significant coefficients of multiple correlation – R. Therefore the regression equation towards composite variable was used. Conclusion goes towards higher or lower orientation towards globalisation of the business, and usage of the world's best practices in daily business activities. While doing so, composite criterion variable (globalisation propensity) was constructed by using 5 questions extracted from leadership questionnaire, specifically answers of our sample of transitional leaders on the following question.

Question 19 of our sample: *Do you collaborate with international companies?*

Question 20 of our sample: *Are you learning from the best world praxis in your industry?*

Question 21 of our sample: *Is your company source of the best praxis in your industry?*

Question 22 of our sample: *Do you modify international praxis, and latter apply them in your business in Croatia?*

Question 23 of our sample: *To what extent international markets influence your business in Croatia?*

Summing of the answers given by each specific respondent on Likert scale starting from 1=not at all to 5=pronouncedly, the aggregate result was derived. Distribution of those results was given in the figure 1.

Figure 1: Distribution of results obtained from composite variable - globalisation propensity

According to the results the distribution is negatively asymmetric, it leans towards higher values while variable *Desire for making gain and profit* has positive asymmetry meaning it is lean towards lower values therefore the variable *Desire for making gain and profit* was calculated not as mean but as median or central value in order to avoid artificial leaning of the distribution towards lower values. Based on the frequency histogram (Figure 1.) we can conclude that given distribution of the frequencies of composite variable is negatively asymmetric. Based on the response results we may conclude that based on the question related to the communication with the global business entities (those out of the Croatia) the respondents answered pronouncedly positive.

The influence of the "push and pull" factor on globalisation propensity

The selection of predictors is based on the following question of the questionnaire: „*What encouraged you to proactively take responsibility for your career development?*”

Based on the sub questions the external factors encouraging “pushing” individual to take a proactive role were derived, as well as pull factors attracting individual towards proactive personal career development were defined. Putting created “push” and “pull” factors into regression equation in combination with composite variable “globalization propensity” the following coefficients of multiple correlation (R) were gotten, and table 1 also shows standard Pearson correlation coefficients r of each predictor with composite variable.

PUSH FACTORS					PULL FACTORS				
Factor	r	R	R2	F test	Factor	r	R	R2	F test
Loos of employment	.856	.856	73%	277,1	Spite/challenging situations	.838	.838	70%	237,7
Profit earning	.934	.935	87%	347,5	Realizing personal idea	.920	.941	89%	388,8
Higher living standard	.937	.953	95%	242,6	Higher social status	.901	.944	89%	267,8
Unsatisfactory career development path	.934	.958	91%	215,3	Self-assertion	.920	.950	90%	229,3
Closest associates					Love towards my job	.934	.953	91%	190,5

Table 2. The results of the single (r) and multiple correlation (R) coefficients obtained with step wise

Push factors	Loos of employment	Profit earning	Higher living standard	Unsatisfactory career development path	Closest associates
Loos of employment	1000	.289*	-.169	.080	.171
Profit earning		1000	.136	.137	.135
Higher living standard			1000	-.068	-.145
Unsatisfactory career development path				1000	.233*
Closest associates					1000

Table 3. Inter correlation component matrix based on "push factors"

Minus sign stands for a negative correlation meaning when one of the variables increases, the other tends to decrease.

Pull factors	Spite/challenging situations	Realizing personal idea	Higher social status	Self-assertion	Love towards my job
Spite/challenging situations	1000	.168	.114	.442**	.463**
Realizing personal idea		1000	.302**	.113	.323**
Higher social status			1000	.058	.079
Self-assertion				1000	.530*
Love towards my job					1000

Table 4. Inter correlation component matrix based on "pull factors"

(Symbol * refers to statistical significance .05 and symbol ** to statistical significance .001)

Coefficients of multiple correlation given in the table 2 are the result of successively added individual predictors to regression analysis in order to make a contribution of each individually included

predictor visible while explaining the level of overall multiple correlation. On the other hand, as table 2 suggests there is a quite small increase in coefficients growth at each 'push', and 'pull' factors, but there is extremely high percentage of explanation of summed variance of each individual predictor, and composite criteria variable, as evidenced by a high coefficient of determination R^2 . While first push predictor 'Loss of employment' explains 73% that percentage increases to 87% once second predictor 'Profit earning' is added. After that it slightly increases to 89% once the third predictor 'Gaining higher standard' is introduced, but when including fourth predictor 'Unsatisfactory career development path' it rises at the same pace to 91%. Finally it stays almost at the same level 92% when including final, fifth predictor, 'Encouragement given by closest associates'.

Almost identical situation is determined in regression analysis of pull factors where combined influence of all five pull factors resulted in remarkably high explanation of 90% of common variance of composite criteria variable results, and all predictor variables. Therefore, we can conclude that named "push" and "pull" factors had extreme significance on the globalization propensity. This way we may conclude that: loss of employment, desire for making gain and profit, and rising of the living standard, in combination with unsatisfactory career development potential, and support of closest business associates "pushed" transition leader towards orientation on foreign markets, and adopting achievements of the world's best praxis. On the other hand, spite – challenging situation that others have said is impossible to achieve, the desire for self-assertion, and realization of personal idea followed by passion and love towards ones work were strongly "pulling", attracting, those leaders with globalization propensity, and international environment in comparison with those keeping their interest, and business in domestic environment.

Intercorrelation table 3 and table 4 prove that all push factors have an independent impact, each of the predictor acting separately on overall globalization propensity. In another words, loss of employment has strong separate influence on one segment of leaders who experienced that situation to turn towards foreign markets. Separate influence was also based on the expressed desire for making gain and profit, reaching higher level of living standard from one side, and dissatisfaction with career development potential, as well as the closest associates support on the other side. Similar influence pattern is visible at pull factor specifically the desire to raise the level of living standard but other pull factors are in relatively significant mutual correlation, making their influence intertwined. For instance, love towards ones job is significantly connected with the desire for self-assertion, but also with spite, challenging situation that others have said is impossible to achieve. However, the intercorrelation height is not reaching level of functional influence that some pull factors have separately or combined on the variations of composite criteria variable – globalization propensity (those which R is higher than .900).

RESEARCH RESULTS

Goldsmith et al. (2003) predict global considerations to become critical in the future in addition to overall general leadership skills, such as, managing change, strategic thinking, decision-making, enabling teams, managing results etc. Their study identified five overall clusters: thinking globally, appreciating cultural diversity, developing technological savvy, building partnerships and alliances, and sharing leadership. Also Mendenhall & Oddou (1985) consider cultural flexibility to be positively related to self-confidence and self-esteem which helps in adapting to the foreign environments. According to Croatian leaders study we can conclude that the presence of higher level of cultural flexibility can enhance effectiveness of global leaders when they are living and working internationally for extended periods of time or if they collaborate with international business partners. Generally based on the this study results different factors had independent influence on globalization propensity and orientation of transitional leaders, while push, and pull factors had almost equal intensity of action. On the other side subjective characteristics manifested through passion and love towards ones work, and the desire for self-assertion, realization of personal idea, the desire to raise the level of living standard, attracted more forcefully transitional leader towards globalization, and if those subjective characteristics were not more pronounced, transitional leaders tendency was to keep their business in their own country limits. Cohen (2010) points out that methods for global leadership development include examination, education, experience and exposure but having “global” experiences at work does not guarantee effective global leadership. According to (2010, p.27) “Effective global leadership requires having lived in more than one country; having traveled to other countries; speaking more than one language fluently; managing a globally diverse team; having experienced an international assignment; and having been schooled abroad.” Croatian leaders’ research results proved the higher the dissatisfaction with career development potential, opportunities for making gain and profit, and standard of living the more expressed the globalization orientation of transitional leaders. The global tendency, and behaviour was additionally amplified by loss of employment, but also support of closest associates. Furthermore, Vogelgesang Lester, G., Palanski, M., Hammond, M., & Clapp-Smith, R. (2017. p. 135) study results suggests “the foundation of leader identity is provided very early in life from experiences in school, groups, sports, and family dynamics—in other words, in a multi-domain context.” Besides that (Beechler & Javidan, 2007; Caligiuri & Tarique, 2009, Caligiuri and Tarique 2012) claim that developmental cross-cultural experiences occur through both work-related and non-work activities, but the beginnings can also be find in family, and friends related international experiences. To conclude with enhancing global orientation and collaboration is critical for effective global leader multiplier effect. Therefore, in order to create more global leaders the leader multi-domain context should be strengthened first.

LIMITATION AND FUTURE RESEARCH

Future research could go towards expanding the sample base including CEO-s of Croatian companies dominantly focused on global markets in order to detect the “push” and “pull” factors influencing their globalization propensity, and then compare Croatian leaders’ globalization propensity with “push” and “pull” factors influencing other Central, and Southeast European countries.

CONCLUSION

The study proved that push and pull factors explaining composite variable have influence on globalisation propensity of Croatian leaders’ therefore null hypothesis was rejected. Regarding H1 transitional leaders are differently influenced by push and pull factors since all push factors have an independent impact, each of the predictor acting separately on overall globalization propensity. Although similar influence pattern is visible at pull factor specifically the desire to raise the level of living standard it is not confirmed in other pull factors which are in relatively significant mutual correlation, making their influence intertwined. However, the intercorrelation height is not reaching level of functional influence that some pull factors have, separately or combined, on the variations of composite criteria variable – globalization propensity. Therefore, H2 Push factors have stronger influence on Transition leaders, is confirmed. H3 The most important push factor is “loss of employment” is partially proved because although the influence is evident we are not able to isolate this variable as the unique variable causing globalization propensity.

DIASPORA AS ORGANIZATION, THE CASE OF THE FRENCH'S ORIGIN LAO

Sangkhavongs, Souchinda

CNAM-LIRSA, France

ABSTRACT

The diaspora as an organization, a contribution to the tension between image, figuration and configuration for a research field of French experts of Laotian origin is our thesis in management sciences. This diaspora has been formed since 1975 following the takeover of communists in the Kingdom of Laos and the exodus of more than three hundred thousand people to Western Europe, the United States, Canada and Australia. The theoretical framework of our thesis is based on the authors of the organization such as the image of Morgan (1986), the configuration of Mintzberg (1982, 1986, 2003), the figuration of Pesqueux (2002, 2005)

During our work we found that it is impossible to distinguish the conceptual part from the empirical validation. Indeed, our immersion (Bogdan and Taylor, 1975), since our childhood thanks to our volunteer parents and very active in the Laotian community of France, has allowed us to provide us with the ground for a longitudinal study (Pettigrew, 1990), a structural anthropology (Lévi-Strauss 1958, 1974) of the kinship.

The twenty first century saw these Laotian associations organized around the mythical figure of assembly. Despite tensions around this image, the people who have worked for this annual celebration continue to gather today with forms of organization that differ from those of the beginning.

How does our input contribute to business management theories and practices in a dynamic competitive environment?

Our theoretical, epistemological and conceptual framework leaves it to decision makers, practitioners, the choice to broaden, adapt their decision to their environment (e), at the moment (t) and context (c). We give some insights of our work through our immersion study.

Keywords: organization, culture, diaspora, network

A SELF-ETHNOGRAPHIC LONGITUDINAL SURVEY

“Self-ethnography is the result of a descriptive and analytical field study of the culture of a specific population, with the participation of the researcher in its activity.”

These ideas can be found in Woods about ethnography, such as “the ability to penetrate levels of reality, the power of expression, the ability to recreate scenes and cultural forms and to “bring them to life”, to tell a story with an underlying structure” (...) Field ethnography “fundamentally involves participant observation (a notion that defines both ethnography as a whole and prolonged observations made in the field by participating in people’s lives), ...and analysis of “official and personal materials”.

Our investigation goes through five successive steps that are:

- Observing ; we are looking
- The collection process; we note, we record
- Analysis of the data; we analyze everything we do from the beginning
- The verification process; we check the consistency of our notes
- The validation process; we reread to make sure that everything goes smoothly.

We can then use those results. This is the idea imbricated by two series of concepts, the PDCA, for Plan, Do, Check, Act, and with the concepts of Review, Verification, Qualification in the framework of "Quality Management".

This self-ethnographic survey is based on three phases:

- The presentation of the contextualized method guiding research on the life of associations,
- The practical problem encountered in the implementation of the methodological approach, namely the choice of site, the collection of data, the degrees of involvement,
- Lessons to be learned from this methodology on the change process.

An approach that offers vertical and horizontal analyses, or procedurals, is called contextual. A contextualized method is a contextualistic or contextualistic analysis of a process such that the transformation it induces is based on phenomena or levels of analysis of vertical and horizontal processes, as well as their interconnections as they evolve over time. Vertical level refers to the interdependencies between higher and/or lower levels and horizontal level refers to the sequential interconnection between historical, diachronic, present and future phenomena. The key points to note are first the importance of integration, the study of transformation in the context and the levels of interconnected analysis, and second, the importance of temporal interconnection by localizing change in the past, present and future. And finally, the question of how the context is the product of the action and vice versa comes from the central hypothesis that the transformation is neither linear nor singular. In the context of a simple migration, a linear transformation aims at direct immigration from one country to another without going through an intermediate step. And singular means that the migrant moves individually. However, this is not the case for a migration of a people, in this case the diaspora, which crosses a transitional territory before reaching the host country.

The second hypothesis of this study is the importance of contextualism on temporal interconnectedness where history is not only an event of the past but where it is alive in the present and can shape the future. History is not only linked to a series of events and chronological events, but to more significant paths if one digs on the side of the underlying structures and logics.

The third hypothesis relates to the role of context and action in which actors perceive, understand, learn to remember and help shape the process.

1 The mythical figure: emblem of assembly

To better understand the mythical Prabang, we interviewed some presidents of associations as well as their members, secretaries, treasurers, coordinators during the annual feasts of their association, or at the 6 pagodas for many years since we participated actively in 2002.

However, due to lack of a suitable place to welcome thousands of people but also because of the transfer of the Velouvanaram pagoda, in 2012 the meeting could not take place.

These cultural, family and inter-welfare associations have enabled us to observe a model of organization that we call an event. The approach of sociological theory leads to this thesis for which we found very little work, apart from the management advice of the projects of the event.

The work of ethnologist Marie H el ene Rigaud on transmission and cultural reinterpretation leads us to ask ourselves questions about the feasts developed by these associations: are they of the same order or do they differ in their object and representation? An organization is considered an event when it needs donations, cooperation, culture, belief, festivals, generations, games, leadership, myths, networks, rites and traditions.

SP, Deputy Secretary General of the Lao Buddhist Youth's Association, has kindly responded to our interviews. Asked how he felt about the organization of the Prabang ceremony, he replied in these words: "as a volunteer senior coordinator and appointed to coordinate the whole party because of my organizational knowledge, my ability to organize and my availability... If it doesn't move, I introduce myself, but it rarely happens... How do we get organized? An office is created, ideas are gathered, discussions and exchanges with each other... "Go, I follow you" is a motto for uniting the world, no matter what the tasks, from sanitary, to reception, techniques, festive or food accessories and even to the information service, each one having to be multidisciplinary... Regarding contact with other associations, the key word is "don't push, it's volunteer! The Lao mentality is that everyone is the leader, we show the way and we also execute except in the case of the royal family.... Convincing others but not shoving and giving them importance, contact is made every day.

TS, president of the association of former teachers of Laos, qualifies the organization of Prabang as a consensus, «Ao Chay Khone» means etymologically touching the heart of the person, going in its direction, not annoying it to be able to work together. Working arrangements are discussed at

meetings with the exception of misfortunes, undecided decisions on the timing, which points to difficulties of three kinds:

- Intellectually: the protocol is the domain of a single person in this case Mr. Arya Panya in view of his knowledge of the royal protocol and who has kept an unwritten memory but transmitted orally.
- The protocol regulation based on diplomats, from the official to the Minister of Foreign Affairs who have disappeared since 1975,
- At the level of participation, mobilization is inertia, a laxity linked to the term “bo pengnang” which means “it doesn’t matter, if it happens like that and not as we decided...”

Sometimes associations decide not to participate for two or three years and come back (this because of problems of inertia sometimes, rarely, laxity). We are detecting a tension within the organizers related to the rise of network leadership. It follows that the project is not enhanced by general coordination.

TS adding that the Prabang festival is also celebrated in the USA in Tennessee, at the Nashville pagoda. In Laos, the RDPL also celebrates Prabang, to show its elements to the Lao people, but also abroad, and even to guarantee the unity of the country.

The question he would like to ask the associations is: what is the interest of Prabang, of this event, of this gathering? The capacity of Laotians to have such a broad common idea is called into question. Hence the interest of seeking consensus with as “objective” learning to accept, to argue; learning about democracy far beyond what we know. How do we live together? How can we be useful? But the poor pride of the Lao not to lose face is sorely lacking.

How is Prabang’s organization felt abroad?

Since 1975, Prabang has not been celebrated in Luang Prabang, its city of consecration, but for the past five years, the RDPL has been releasing a statue of its so-called original chest, buried for the rest of the time at the National Bank of Vientiane, the capital of Laos.

N «For twelve years, everyone participated, and the goal was the gathering and this year it is "if you do not, we do it"»

To understand the rites of Prabang and its importance in the life of the Lao diaspora, it is important to trace its origin, the creation of the new statue for the French of Lao origin.

In France, the Lao de France community celebrated Prabang since 1999 through its associations and under the patronage of Prince Sauryavong Savang²³. The associations decided to celebrate the Day of Remembrance on Pentecost Day so that the faithful (a few hundred to two thousand participants depending on the years) could attend the performance. An active, voluntary and trans-generational organization (4 generations are in contact with each other on this day) characterizes this celebration. For the first generation of exiles, this gathering means a day of commemoration of the bond that

²³ Sauryavong Savang is the youngest son of the late king Savang Vattana, the last king of Laos, exiled to France since 1975. Various cultural and religious events are placed under his patronage.

connects them to their homeland. The charismatic and mythical leader is a statuette of Prabang, reconstructed for the occasion by the venerable Viengsay Sudaros²⁴. The presidents of the association Lao of France, family, cultural, cultural, friendly, sporting, cooperative and support, gather their members, every year and participate together in the preparation of meals, the setting up of places of the ceremony, the cleaning, the security, the service of order and the running of the party. Each organized member has a specific role and performs specific tasks, according to decisions taken in plenary session. The agenda for each meeting shall be set in advance and minutes shall be constituted and sent to each Chair.

The case of the celebration of the statuette of Prabang shows the interest of the study of a cultural practice in the reflection on the organization, in a rationale of territoriality.

As regards this organization, two phenomena occur, which lead to a temporalization concomitantly to its territoriality.

The first phenomenon is the transmission of culture to the youth of the diaspora. On the one hand the family organization is formally persisted, but on the other its significance on the new territory changes. Indeed, our participation in the ceremonies led us to see a reinvention of the meanings of ancient rites.

There is a contrast between respect for values and the disappearance, in a different territory, of the conditions for the application of these values, which transforms their nature by the transmission of ancestral rites, despite a recreation of the rite based on a scrupulous reconstitution of the statuette. From this point of view, the rite indicates a concomitance between, on the one hand, continuity with the maintenance of the family organization and its role in the transmission of culture, and, on the other hand, an organization of rupture with the destruction of orders of precedence. This order of precedence is, however, retained for one person: Prince Sauryavong, the political heir of the kingdom in exile. This Prince, or at least his advisors, is at the origin of the second phenomenon: the division in 2012 of the community.

It would seem that a break is emerging: on the one hand the faction following the prince remains attached to the order of ancestral and political precedence, recreating a link between politics, religion and organization that evokes the beginnings of the kingdom of Fa Ngum, on the other hand completing to cut this link. Does the organization then reside in the creation of an exiled kingdom based on the traditional family transmission of social values and behaviors, or in the commemoration

²⁴ The venerable Viengsay Sudaros joined the Buddhometta pagoda in 1978. Artist, sculptor and cartoonist, his talents allowed him to create a large white statue of Buddha sitting on a lotus. He had made a vow to join the monastic community at the end of his work, which he did. He became himself venerable and spiritual leader of this pagoda.

of a distant origin – both in time and in space – as a link that organizes by a cyclical time a community that is completely integrated into what is now its territory?

The territoriality of the organization is accompanied by history: the return to tradition becomes undeniable after the 2012 split. Two scenarios emerge: one evokes the reconstitution of a kingdom – or more generally a mode of government – deterritorialized, while the other evokes the commemoration of identity of extraterritorial origin. These two scenarios could be compared to other organisational cases, in space and time: the first to the organization of the Tibetan government in exile, the second to the exodus of settlers in America.

2 The Network as a Factor of Organizational Sustainability

Rightly so, these facts recounted above give us elements that allow us to better understand our study case. We find a figure of uniqueness and specificity that we will describe as reticular with more or less stable relationships of a variety of people, hierarchies and talents with affiliated preferences, people benefiting from their affiliations with respect to obvious principles accepted by all people of goodwill in order to respond to the problems that arise in practice. As a collection of individuals, it leads them to decide on the most effective forms of organization. This common perspective of economic, political and moral type identification is a form of managerial-centered substance.

As in an industrial cluster that is a set of complementary enterprises effectively coordinated around a more general common objective (Ferrary-Pesqueux, 2004 p. 115) and bearer of "economic dynamics", these networks of embeddedness (*rooting, embedding, recessing or even anchoring*) are a form of organizational success as they lead to the sustainability of the organization. *There is a high frequency and a high density of social relationships to enable us to anticipate individual behaviour that could lead to exclusion from the exchange if the social network does not provide relevant information; the transitivity of social links depends on the speed of concretization and the density of the strategic behaviour linked to each individual's affiliations.*

Community identity is materialized by philanthropic actions characterized by the gift. These symbolic and psychological goods are of the order of exchanges of politesses, feasts, rites, dances, feasts, the obligation to make them, on the one hand, an obligation to receive them, on the other; covenant and communion in these institutionalized places of socialization are implicit rules of the constituent community of networks leading to a "reticular organization".

This community is bound by an informational dimension and by a cultural dimension of interpersonal knowledge, for which the dissemination of new information between social coercion and common knowledge translates honest behaviour, a collective rule, behaviour in conformity with a general rule, arbiter of common knowledge.

The main vector of this network is therefore its ability to inform its entourage and federate around this rite in order to reach a lasting organization. This reference to the organization of the territory of origin of the diaspora has concentrated on the cultural organization: are rites likely to form an organization?

The younger generation seems to question the meaning and usefulness of ancestral beliefs, through the gestures and the fundamental rules of a Buddhist feast particularly loaded with cultural and political value among the Lao. Before the 2012 split, it is the change of territory that seems to create organization, in a logic of return to a tradition. Thus, the cultural approach is an indicator of the organization generated by exile, and therefore allows for more general reflection in terms of territorialization of the organization.

LONGITUDINAL RESEARCH PRACTICES IN ORGANIZATIONAL CONTEXTS

Observation of longitudinal research practices in organizational contexts has revealed several comparisons, between companies in the same industrial sector and then enterprises in different sectors. They were refined by direct sector comparisons based on a combination of retrospective analysis. Other comparisons involved real time, duration, limited to three years instead of twenty years. However, ICI's strategic work (Pettigrew, 1985) is based on a ten-year real-time analysis, comprising 20 years of retrospective data and 10 case studies over a three-year period. In addition, the researcher is responsible for defining the design of research within its theoretical framework. Miller and Friesen (1982) quantitatively and in pieces described Pettigrew's revolutionary and evolutionary era (1985). While Tushman and Romanelli (1985) interested in periods of convergence and reorientation.

The significance of change is the important and essential question in temporal analysis, as Whipp (1988 p. 221) recalls on the social and subjective necessity of time. What does transformation mean in research? Elchardus (1988 p. 36) argued that time is increasingly recognized as a relevant and non-secondary factor in social change. Time is not just "over there" as a mere chronology, it is "here" as a social construct.

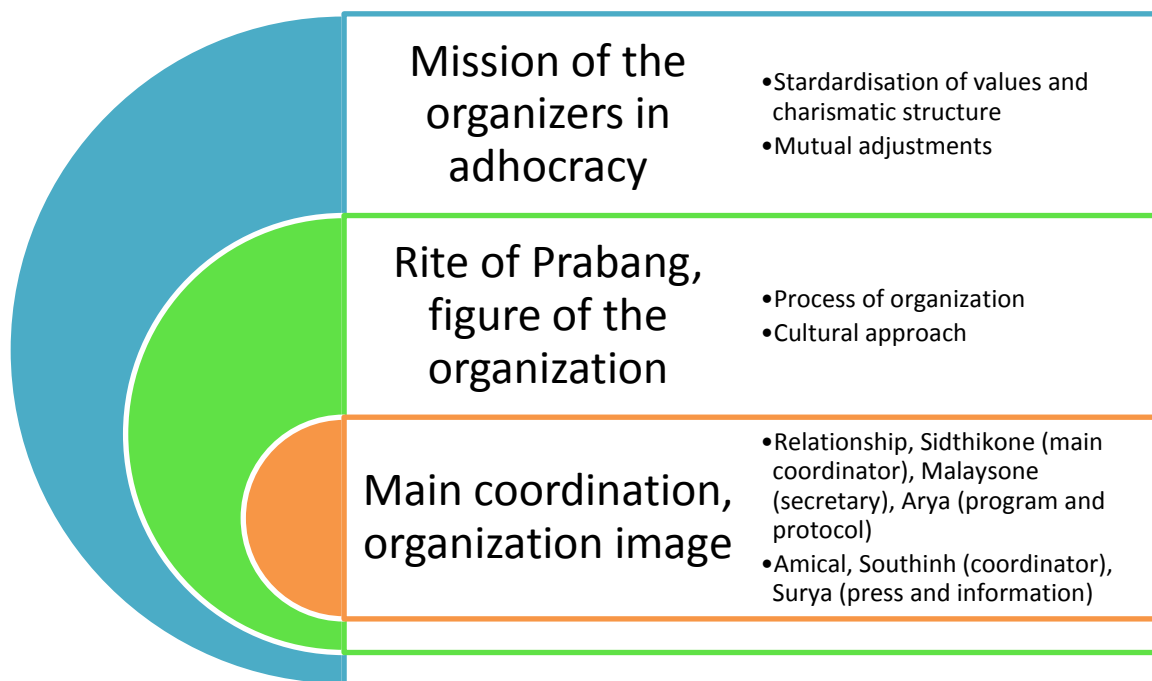

For the longitudinal research practitioner, time issues are crucial in relation to chronological choice; the beginning and end of the process, the best time, the evolution of the result. Is time just a series of chronological events? Is it a socially constructed phenomenon that influences behaviour? Choosing data collection is important to connect the past and the future.

1 The rite and symbol of the network

The ritual of the celebration of Prabang is a recurring element of the network coming to make organization; it allows the organizing associations to speak in the name of a single culture, a common sense in the way of the *sense-making* of K. E. Weick. Making sense of this day, living together, laying down weapons, banishing belligerent thoughts gives them the fullness of the moment.

However, this strong symbol of the network which is the statuette representing one of Buddha's lives is rhythmic for the organization itself. Between October and November, a summons to the preparatory meeting of this festival is sent by the main secretariat. AP and his wife, MP of the Sri Savang Vatthana Foundation, are responsible for these administrative tasks. The role of the main coordinator is attributed to Mr Sidthikone, President of the Luang Prabang Association and is MP's brother.

Table 1 Organization nexus Prabang Cakayamouni network

This cross-section of the Prabang Organizational Holiday Management highlights the kinship and friendship between the various coordinators (Sidthikone and Southinh), the planners of the ceremony (the Panya family) and the senior blogger (Surya).

- Sidthikone is Malaysone's older brother, wife of Arya Panya,
- Southinh was Surya's stepfather from 1990 to 2014.

In close collaboration, these people conduct the organization of the Prabang ritual regularly once a year and mobilise associations and friends.

This organisational process becomes a cultural anchor with adhocracy management whose main action is of two kinds: take into account mutual adjustments and standardize common values by highlighting the common charism.

Prabang Cakayamouni Network

According to Southinh's notes, The Statue of Prabang Cakayamouni covering the holidays from 2000 to 2012 was made in France, with the assistance of Venerable Sudaros, superior of the Pagoda BOUDDHAMETTA.

Alloy materials such as gold, silver and copper were offered by the Lao diaspora. It can be said that this statue is a common heritage of all Lao in Europe.

Construction of a main building of the new Pagoda is complete. The development of Chamigny at Bussy Saint Georges was carried out towards the end of 2012. The location of the new Pagoda is one fifth of the surface of Chamigny. Perhaps, for the reason of the reduced surface, the superior of the Pagoda organized from 2013 the celebration of Prabang with the Statue belonging to his Pagoda. It can be seen that the organising associations have reduced considerably (see table of the 2nd network)».

Coordination and management of the Prabang Cakayamouni Network

- 5 cultural and cultural associations participate in the ceremony of Prabang Cakayamouni Network from 2000 to 2012 except in 2008 for the association of young Buddhists and their president do not join the organizing committee because they are monks and generally take care of the religious aspect.
- 4 family associations have also participated since 2000 and the 5th, the Sananikone association has joined the organization since 2006. The Princes Sauryavong and Soulivong SAVANG are presiding over this feast.
- Of the 15 territorial associations, 6 have started since the beginning without interruption and each year a family association enters the circle.
- 10 support and support associations also participate in 2000 and 2012. Their president and member joined the committee except for the Lao of Orleans fraternity and the Lao classical musical heritage for reasons of remoteness and training. Safeguarding the legacy of music involves training on weekends and holidays. So they don't have time to participate in the organization. On D-Day, however, the members of these associations are active in helping with culinary preparation and playing ancient musical instruments imported from Laos.
- 4 companies have followed the celebration from the beginning with donations in cash and in kind such as drink, administrative supplies and maintenance products, cutlery. For example, Raja entered through its employee, Mrs. PHOUMPADIT, from 2010 to 2012.
- 1 blogger on behalf of Surya Pravong acts as a communications and press blogger via his blog laonet.fr. By doing so, it informs the date of preparation, transfers invitations, takes and publishes the

photos and videos of the ceremony every year without interruption. This is how the Lao diaspora abroad and in Laos saw the ceremony unfold. Above, the screen capture dated 27/05/2018 showing the number of visitors from France (209,438), USA (22,743), Canada (5,605), Belgium (4,741), Laos (4,253) and Germany (2,342).

From 2013, a second network of the organization of this ceremony marks the split between the Prabang Cakayamouni network and that of Phouthalavanh.

The organizers

We find that teamwork is also a family affair. We have participated in these meetings over the past three years at the request of our parents, who manage an association called *Amicale des Anciens*

Compagnons (AAC) renowned since this year *Amicale des Amis Lao (AAL)* to rejuvenate it (this association has existed for more than thirty years). The Lao Women's Association in France *is the oldest*.

The ritual of the assemblies is above all a matter of ceremony: the meetings take place at the Buddhometta pagoda in the presence of two monks which guarantors of tolerance of comments.

Two or three weeks after the end of the celebration of Prabang, a general assembly of balance sheet closures takes place at the same pagoda followed by the same rituals.

The network of friends and families provides a pleasant working structure and gives each other the strength to achieve the goals set out together at these meetings. Mutual support is a strong symbol for the advancement of this network: any preparation, whether culinary, or embellishment of the pagoda, works, requires the participation of volunteers, consenting, available and natural participants.

2 The nature of the relationship with the country of origin through its humanitarian actions

The Laotian diaspora gives time, money, food to share in the form of donations. Marcel Mauss calls it a gift/counter-gift and Marc Abeles adds that it represents non-economic goods (symbolic, psychological, etc.). We have identified donations from individuals and associations as shown in the following tables for the organization of the celebration of Prabang between 2002 and 2010. The surpluses are given to the pagodas Velouvanaram and Bouddhametta to serve as working capital for the following years.

Table 2 Comparison of revenue and expenditure Prabang

Year	2002	2003	2004	2005	2006	2007	2008	2009	2010
Revenue	8 691	7 238	7 746	6 454	10 239	7 575	11 241	15 378	11 566
Expenditure	4 398	3 612	3 249	3 112	6 366	6 168	3 821	9 595	7 086
Donation							7 420	5 783	4 172
Excess	4 293	3 626	4 497	3 342	3 873	1 407	0	0	308

This table concerns the organization of Prabang Cakayamouni's processions from 2002 to 2010.

Food donations are supported by all participating associations. Each association or large family takes care of a culinary dish, logistics, stewardship, security, cleanliness, hospitality, information, presentation, and site cleanup operations. There is no leader, supervisor in the group, but the advice given is generally taken in the context of tolerance, where the level of belonging is equivalent, the case of friends, and in the context of caring, for example, from a father or mother to his children. Children also follow the advice of the 'elder' even if they are not part of the same family.

LONGITUDINAL STUDY AND TRANSFORMATION

Comparative longitudinal case analysis (Menard, 1991) is interesting because of its capacity to modeling the transformation process and, on the other hand, the strategic changes linked to the evolution of the organization in the hierarchy, which are supposed to have an impact on the entire organization and its strategic management.

The longitudinal analysis has three characteristics: the data collected cover at least two distinct periods; the subjects are identical or at least from one period to the next; o, the analysis usually consists of a comparison of data between or over two distinct periods, or a restitution of observed evolution. The comparison between two periods is based on a longitudinal analysis of a comparative static type. Comparison of data over two periods and restitution of observed evolution are longitudinal analyses of a dynamic type.

Pettigrew, Woodman, and Cameron (2001) emphasize the consideration of time in longitudinal studies and elevate entrenchment to a basic methodological principle for conducting a longitudinal case study. For the author, the causes of transformation are neither linear nor singular, they involve multiple levels of interconnected analysis that evolve over time, and whose boundaries are often blurred. The study of organisational processes over time requires understanding the evolution of their context, but also their content, and the actors involved. An embedded configuration enables systematic comparisons to be made between the evolution of different contexts, and thus offers the opportunity to reveal beams of multiple causes, causative loops and various interconnections. Forgues and Vandangeon-Derumez (2007) underline the relationship between longitudinal research and time, agreeing on the importance of time varying depending on the type of research conducted.

Here the choice of model is that of two representation modes, either by reference to figuration or by reference to configuration. The reference to Pettigrew and the longitudinal study relates to our close-up case study. Thus data from the field are detailed to try to establish comprehensions by mobilizing theories. Pettigrew 1990, Van de Ven 1992, Langley 1999 proposed methodological paths for the realization of longitudinal empirical studies whose purpose to generate an understanding of transformation. According to them contexts, contents, processes and their interactions are to be explored in order to grasp multiple causalities, feedback loops within the same context.

It states that *“research on change that is both useful for theory and practice must explore contexts, content and processes, as well as their interactions over time (Pettigrew et al, 2001). Researchers are then faced with a dual challenge of both catching reality in flight and studying long-term processes in their natural context, leading to multiple levels of interconnected analysis (Barley, 1990; Pettigrew et al, 2001). They therefore need appropriate methods to study these dynamic phenomena in order to grasp multiple causalities, feedback loops within the same context (Langley, 1999)”* [in *“Strategies for Theorizing from Process Data”*, cited by Musca (2006,

pp. 153-176) in the paper "A Processual Research Strategy": The Longitudinal Study of Encased Cases].

1 The longitudinal concept

Observation and verification of this form of self-ethnography ask the questions of data collection and the degree of involvement of the observer. Yin (1984) raises the issue of listening, adaptability, flexibility, expertise, and impartiality of this observation, as well as verification of sound knowledge on social and policy issues that affect different levels and functions within and outside the organization.

The data collection process is linked to the following:

- Processual the emphasis is on action and structure,
- Comparative; and the idea is a series of studies in various sectors,
- Pluralistic; Describing and analyzing the often contradictory versions of reality seen by those involved in process change,
- History; taking into account the historical evolution of ideas and actions in order to understand their transformation, as well as the constraints to which decision makers are subject,
- Contextual examining the reciprocal relationships between processes and contexts at different levels of analysis,
- Data collection aims to show how actors mobilize in economic, sectoral contexts to legitimize and delegitimize ideas for transformation and continuity at the organizational level.

In the field, we use a triangulated methodology to collect the different types of data through cross-checking. The purpose of triangulation is to build on the particular strengths of the case study. Interviews can bring depth. Documents can provide facts. Direct observation provides access to group processes and can help the researcher confront the views of interviewees from informal conversations about their actions, which they actually do. Data collection concerns observation and verification.

McKee and Pettigrew (1988) presented their case studies in public services as follows:

- (a) *In-depth interviews* with key informants: chosen because of their leadership position in the organization or in the process of change being analyzed; those affected by the changes as well as the initiators of change; the different elites and interest groups internal and external to the organization (on average 50 interviews per case). The interviews are recorded. The proformas interviews are discussed in each research team, tested in the field, and modified if necessary.
- (b) The documentary and archival data - *including relevant meeting minutes, policy or strategy documents, secondary data related to activity levels, project discontinuances and disclosures, memos, and correspondence.*

- (c) Observation and ethnographic material: *including formal assistance, meeting on site facilities, visits to meet staff; as well as informal based on chance, meetings, conversations, and time spent in the organization.*

They have worked on a sample of about 15 individuals in key positions within the organization, in the past, in the present, or who are explicitly linked to the organization's future concerns.

In view of these archive, elements of fact and interpretation, the general trends of this type of case appear with:

- Analysis of the chronologies,
- Interpretation in relation to theory,
- The meta-analysis.

Clarity on research objectives is crucial for any social scientist. These objectives include:

- The precision of the measurement,
- Generality on actors and situations,
- The realism of the context,
- Theoretical and conceptual development,
- The contribution goes from the individual to the general on issues of policy and practice.

In the introduction, we also see that Pettigrew quotes on page 269 that we must conduct the analysis called contextualism of a process between two levels of analysis, time sequences in horizontal that will interconnect and in vertical intra-organizational and environmental elements. A cross contains in abscissa (horizontal) the time that can be connected and interconnected and in ordinate (vertical), the organizational scale from inside to outside.

Page 273 is the synthesis of other researchers which is the approach of the theoretical question on time. This measure is defined, framed *ex-ante* by this theoretical and systematic definition: it is not historical time but historical framing, from such period to such period.

The subtlety in management is to study a given year at a present time to see until the new reform, for example on the health issue: a time interval and a field for the researcher that they will define from the question that we ask ourselves. From there comes, and the terrain, and the observation period for those who study transformation.

Theoretical frameworks of change will not have the same intervals, the same cuttings in sequence and in event. Pettigrew, realizing this, overlaps the various frameworks of in fine *analysis*, in a multi-dimensional approach. For him the meaning of time in a temporal analysis is the duality of time, first as a chronology, it is the horizontal arrow and time as a social construction that is the vertical arrow.

On this basis of his analysis, Pettigrew does not look at a single point of view but different facets in a

chronological sequence from events that are linked to each other. The tension of time appears as a social construction and these events in this timeline.

These time loops are implicit rites in a logical of social system and not temporality from the point of view of historical science. Interactions between ritual sequences will create social time; it is the laying of first stones in an event structure. In other words, what is important is not the ritual but the social construction that results from it.

Pettigrew wonders how the event is built but once the stone, that is, the object is laid, the very meaning of the event changes over time. Take for example the decision to build the Concorde, marchais-Roubelat (2000, p. 197) wrote: *The French adventure of the Concorde began in the fifties, it continues to this day. Officially, the decision to build a supersonic transport aircraft (TSS) dates from the signing of an agreement between France and Great Britain on 29 November 1962. This agreement is part of a process that created the conditions for its onset, while its effects in turn guide the process.*"

A few years later, this Concorde became an economic and financial pit. Twenty years later, the industrialists commercialized the plane and in the end he ended his race dramatically taking two hundred people to death in Gonesse, a suburb of the Parisian East. From the decision to build the Concord and as other events occurred later, the original meaning changed: in (to), this meant construction, in t1, t2 or T3 meaning changed. The meaning of events is therefore not fixed in time. The facts change not only the context of meaning but also the meaning itself.

In this logic, the study of the organizational structure of an undertaking is made of its creation when it reaches one hundred employees. We then analyze when it changes its structure and what the correlation is between the number of employees and the structure of the company, but nothing says that we see what is really happening; we imply that before the creation of the company there was nothing, but this company could have been informal for a number of years with actors who did not appear in the context of its formal creation with the deposit of its statutes. There is a t0 with a certain structure that in t-5 already has its structure while the study was done from its formal creation.

When one takes the event history, according to the context, the perspective of historians, the place, the history is not taken in the same way, which constitutes the rupture between one and the other and the basis of discussion. It is therefore important to justify time borders in management in relation to the problem we have.

For our field study, we use a longitudinal approach, but the question is whether the organization is a figure, a configuration or an image. By definition, the diaspora exists only over a long period of time with this temporal depth of twenty years to make a generation, so this duration is long enough to see generational change. (Pesqueux, Mintzberg and Morgan). We justify a knowledge that can go back quite far even if the analysis in the field is shorter but that this analysis is justified ultimately by the

organizational processes that are the rites and routines that will organize this diaspora, especially through the cult of Prabang. A 17-year period (2000 to 2017):

- Period 1, 2000-2004,
- Period 2, 2005-2008,
- Period 3, 2009-2012,
- Period 4, 2013-2016=> Breakdown

2 The process of transformation

The diaspora can only imagine itself as an organization in relation to its duration and with this generational change what one can have over these 12 years but at the same time it is a network that is founded by an organizational process that is the rite of Prabang. This shorter period of observation, but in which the problem of this rite is particularly important, is linked to this crisis at the end of 2012, where the twelfth year of the organization of the rite, which is precisely in our time focus, sees the split in two of the supporters of the rite of Prabang.

We posit that it is an organization in the sense of Weick, atypical but with an organizational process; it shows a tension over time, a configurative vision at the Mintzberg, an image at the Morgan, a vision of the «figure of the organization» type at the Pesqueux: three visions of an organization that can be understood through these three prisms.

This diaspora organization is atypical with an international, geographical and above all a defined dimension because the actors recognize themselves as belonging to the diaspora, or at least that some recognize themselves there and also because this diaspora lasts. The diaspora is not just organized immigration, it is an organization that lasts in time.

Our case study relies on this methodology with a long time period to allow the constitution of the diaspora. People recognize themselves to belong to the diaspora and therefore to the process of organization. In order for this entity made up of people to exist, a common activity is the starting point for the coordination of behaviors for an organizational purpose, for example, through the rites of Prabang.

The land of the Laotians will allow us to follow the text of Pettigrew linearly showing the figure of the organization through Prabang. In this case, the working hypothesis is that the members of the diaspora, over time, will change a local or even global organization according to the different environments in which they settled in France or the USA. In other words, a configuration logic leads to think that the diaspora will change depending on where it is located and is influenced by its different environments.

In a figurative logic, it is rather a holistic vision that wins. What will characterize the figure ? And if it is an image, it is a type of operation, we will analyze the organization, the evolution of its operation

according to this type of image. The specificity of the diaspora entity exists only because it lasts, and this through a longitudinal analysis over eighteen years to have all the context but also that of individuals, inter-groups in these different national and international environments understood in relation to the country of origin by showing the different events that will happen. It will be a double temporal analysis on a long time with the arrival of the young people while also observing the functioning of this organization with regard to the evolution of the rite of Prabang.

To sum up, Prabang, a mythical hero, is at the origin of the creation of Kingdom of Laos. As a result, its commemoration and the ritual process are organized by royalty and the principality. But since the advent of communists in the kingdom, the principality has been exiled and the rite has been revived from 1997. The original statue is not exactly in Laos because the diaspora thinks that it is elsewhere, probably in the USSR after this mass exodus of Laotians. The myth of Prabang is linked to Laos ; the provinces, the partisans of each principality can unite only if Prabang is in this kingdom. In France for the purposes of this ritual and to show to the French of Laotian origin the reunification of all associative activity, another statuette was built for the diaspora. But a crisis erupts in 2012 about this statuette created at the time of the gathering of the diaspora ; another is used during the twelfth ceremonial, and creates a first tension. A second tension will arise from the split between the organizing members about the purpose of this day, the day of the diaspora or the worship of the ancients.

It is a longitudinal but also self-ethnographic study that is justified by access to the field in immersion and participant observation. The ethnographic part, on a more recent period, is based on surveys and a position, not auto-ethnographic, but justified by our identification of the diaspora (Marie H el ene Rigaud, 2012).

In this longitudinal approach, the horizontal axis marks the departure of the diaspora in the different countries. The two rites of Prabang in France are integrated on this axis and a third in Laos, the country of origin which remakes its commemoration. Here we see continuity.

On the vertical axis, the participants of the diaspora from:

- Different groups of the diaspora spread around the world,
- The diaspora as such brings together all the groups,
- The diaspora in the countries of arrival where the groups are (for contingency),
- A particular country for the justification of the diaspora, Laos.

A contextual analysis of a process highlights a horizontal phenomenon that is the timeline in the form of three arrows. The vertical level shows the interdependence between levels of analysis and to explain a phenomenon belonging to another level, this is:

- Youth

- Subgroups of diaspora,
- Organizers of the diaspora,
- Groups organized by country,
- Both organizational and geographic levels characteristic of the diaspora,
- Countries in which the diaspora exists and,
- Laos against weight.

The guests, the organizers, all the participants form a group. The first group represents the organizers, their environments. The second group consists of the whole of the diaspora compared to the rest of the world and finally the third group is that of the participants in Laos.

So our question is what will happen from one level to another.

It is noted that the diaspora will interact on the country of origin by the cult of Prabang, and, subsequently, impact the role of the organizers at all levels. The presence of the diaspora of the different countries, which symbolizes (a little too) the rest of the world, will modify the diaspora itself, this because of the effect of contingency and the relation to the country of origin, Laos. Thus the Pettigrew interaction is distinguished by this schema developed by Besson D., Olaba A. (2017).

The difficulty of the thesis is to justify by figures, the organization of the myth of Prabang in the country of origin. We can't obtain it because, on the one hand, since our exodus, we have never returned to our country of origin, Laos, and, on the other hand, our field of research is constituted by the Laotian diaspora in its together, that is to say by all the participants of this day and living outside Laos. However, photos obtained on the site of luangprabang-heritage.org show well the rite of Prabang in Laos on 17/04/2015 and also that of 20/04/2018 on the site of laoslike.com.

In order to compare the rituals in Laos with those made in France, we have collected 3 main photographs showing the statuette of Prabang as well as the procession of participants, and, old photographs, April 1974, showing the king in procession. The ceremony unfolds as almost identical. (Figure 19 and 20)

Table 3 Longitudinal plan Pettigrew

According to our reading, the graphs in three dimensions below, give a possible comparison with regard to the number of participants, organizers and associations according to our 4 periods of time (defined above) since the beginning of the organization of this gathering until it breaks.

As noted, this rupture appears between the supporters of the so-called day of the diaspora and those of the day, so-called, of the worship of Prabang, in other words, a rupture of interpretation between an old version and (so-called) news. On the same basis of representation, a graphic for the organization of the Laotian "Youth Encounter", will allow to evaluate the impact of the participation of the new generation of Laotian emigrants on these cult-cultural gatherings of the Laotian diaspora.

These two tables are the basis of work for the empirical part of our thesis.

Table 4 Prabang from 2000 to 2017

This graph shows us that the curves of participants and associations follow an upward trend from 2005-2009. That of associations believes more quickly from the period 2010-2013. But note that the three curves are going up since 2010-2013. This is explained by the massive mobilization of members of associations, their networks. In addition, the organizers give their time for the preparation of the place, the kitchen, the cleanliness but also financially. Likewise, participants bring offerings, consisting mainly of fruits, desserts, rice, drink, but also money for incompressible expenses such as water, electricity, renting dumpsters, mobile toilets ... (Annexes C 2002 p. 176 à C 2012 p. 187 et P 2012 p. 187 à P 2018 p. 199).

This table shows us that young people are actively involved in the beginning of the creation of this meeting in 2002 then the number decreases in 2003, 2004 and goes up slightly from 2005 to 2008. 2009 sees a significant decrease of the young people and 2010, a strong increase then goes down again until its total shutdown in 2013 with the transmission of the organization to the representative of Solidarity of Lao Youth ". This is explained by the age of the second generation approaching fifty or even for some sixties. Another factor is that the third generation begins to build their working lives with the search for work and the foundation of their family. (Annexes RJ 2002 p. 244 à RJ 2012 p. 295)

The organizers' curve is on the roof, the opposite of the youth curve This is explained by the fact that the 1st generation gives breath to the third by entrusting more responsibilities to the former participants so that they take over. This succession takes care of the days of meetings, the program, the workshops of history, geography, dance, cooking.

The associations take care of all the logistics, the budget and the expenses of these days. Each of them gives 100 € per year and to date, about 1 400 € are in the fund of the Amicale des Amis de Laos, formerly known as the Amicale des Anciens Compagnons. These associations increase each year and in connection with the organization of Prabang.

In the case of the Laotian diaspora, we limit the external and internal contexts to the following characteristics:

- The external context includes the origin of the diaspora, its characteristics and its evolution.
- The internal context highlights trust, its history, the action of the coordinators, its organization, the generations.

Longitudinal analysis is eventually supplemented by surveys, using a method of field immersion in the form of self-ethnographic participation. Two periods are observed, that of the organization through the rite of Prabang, with its evolutions, and that of the reproduction of the diaspora. For the latter, it is the study of representative associations of global action, of meetings between young people and their parents, data of participants, their associations and their members.

The quantitative data of associations, their members, surveys and ethnography are a first step in the analysis.

Two levels of organization, one internal, constituted by the archives, and the other external, which is the reproduction of the diaspora over time, demonstrate that the whole resists as such (a form of resilience then). The multiplications of the ritual process forms of Prabang reveal that on the one hand, the younger ones do not fully respect, or at all, the ancestral values, of origin of the myth, if not the old ones in any case, but that of on the other hand, they are the ones who will create a new mythology of diasporic Prabang.

This is how an organization, which finally has the characteristics of the approach of contingency,

image and figure, and at the same time will surpass them all at the same time, becomes an interesting look to study, hence our research project.

L'ANTHROPOLOGIE STRUCTURALE ET L'IMMERSION PARTICIPANTE

The study of our field, the case of the Laotians plunges us into the family structure, the organizations of ceremonies, parties, marriages, births and deaths in the community around the Paris region but also in the Provinces of France and sometimes of Belgium.

The structural anthropology and participatory immersion approach allowed us to study these habits and customs.

1 Structural Anthropology

The transformation of mythical narratives into the structure of kinship is one of the contributions of Lévi-Strauss in the social sciences and deals with mythology and ritual, which interests us particularly. According to him, the stories are messages to transmit, metaphorical speeches.

For Lévi-Strauss, the structure is an order that must be accounted for :

- The importance of exchange and reciprocity in all cultures.
- The importance of social and cultural activities, such as beliefs and customs, kinship rules, myths.

In the first chapter, his demonstration is based on language and kinship, social organization, magic, religion, and art. The basis of any structure is the family consisting of father, mother and children (Radcliffe-Brown, 1926). The composition of this family creates, moreover, social relations first degree:

- Parents and Children
- Children - same parents
- Husband-wife parents of the same child

The second degree is that of the relationship of the parents on the father's side, the siblings on the mother's side, and the mother's sister on the mother's side.

The third degree is the sibship of the father, the fourth and fifth degrees are cousinhood, of the family distant several degrees. To illustrate our point, it is common for our parents to introduce us to people who have very strong friendships and whom we consider to be first-degree family members. This is what we call the best friends of our parents, father and mother. This is in order to structure and thus maintain the links that also benefit children. These sometimes become much more than our own brothers or sisters. Afterwards, the patriarch or the leader, the coordinator can thus mobilize the world for a large-scale activity. The Prabang organization and the Youth Meeting brought together all these structures.

It is accepted and advised to have a language marked " good word ", Neutral and anxious to gather and not to divide. Language structures social activity. The preparatory meetings and commemorative days of Prabang are held at the pagoda. We pay more attention to what we say or do. In each report, it is stated that before starting the meeting, each person prays to calm his ardor. The appendices relate these prayers in the minutes of 2002, 2004 and 2010 (Appendix C2002, C2004, C2010).

2 Participating immersion

The participatory observation method is abundant. Georges Lapassade quotes Bogdan and Taylor (1975), who define participant observation as a research characterized by a period of intense social interaction between the researcher and the subjects, in the middle of the latter. During this period, data are systematically collected (...)

The data collected comes from several sources in the research field : researcher observation, casual conversations, official documents and meeting reports. In observation, there is the idea of remoteness, restraint, no intervention. It is peripheral, active, complete, from the outside and the inside, with a distance from its object. However, this observation, in some cases, remains a brake on active research.

A variant to participant observation is immersion.

The land of the Lao diaspora is conducive to participating immersion. Strong involvement in the approach to the field to understand the workings of such a machine.

What is Participating Immersion ?

The researcher is immersed in the heart of his research field. He actively participates in the social activities of his research subject. He is at the heart and ready of the stars ". Through this, he knows the habits and customs, tradition, language, posture to observe vis-à-vis his land. This will allow him to understand the correspondent when the latter reveals a strict minimum.

Immersion in a sensitive area, often the case of the diaspora, calls for a look of kindness. It is in these conditions that we obtain the Keywords To open the field of the possible, the dialogue, the common language.

Participatory immersion allows crossing the collected data with the lived experience. As a result, it provides additional lighting from the angle of the observer. The researcher uses 3 prisms : that of observation, that of immersion, and that of participation.

In parallel with our theories mobilized, the observation is seen from the angle of the image, the immersion, that of the figure and the participation, it is associated with the configuration. Is it an abuse of language ? This must be demonstrated.

The working documents come from 4 different sources :

- That of Southinh, President of associations and coordinator of youth meetings and the day of Prabang Cakayamuni (C),

- That of Tiao Bouavong, adviser of the prince and responsible for the organization of Hot Song Prabang Phouthalavanh (P),
- Those of AP, former head of the Protocol at the Luang Prabang Palace, active participant and total immersion in the organization of Prabang C,
- The photos, images, on the blog of Surya Pravong, informal press of the Laotian community in France.

Our immersion during these 12 years allowed us to make a state of the art of data :

- A formal structure of the documents provided by Southinh shows an awareness of the configuration.
- The organization of Prabang P at the beginning was informal and doing like the organization of Prabang C, with the program, the publication of the moral and financial report, here appears the figure of the organization.
- The images shown by Surya before and after the ceremony of Prabang C and P testify to the power of these rites.

CONCLUSION

We talked about the diaspora's interest as an organization by giving several definitions from the angle of geographers, historians, political scientists, economists and financiers. We give a definition for our discipline, which speaks of the non-linear and non-singular transition over several generations in several territories. It is a scattering of a population in great mass around the world because of the man and / or because of the nature.

Through our work on the fifty Laotian associations in France, we have identified and understood this diaspora which is organized into a network of relatives and friends. This allowed us to define the problematic of our thesis which is of three orders :

- Understand the nature of this organization,
- Look for tensions related to the organization
- Identify the sustainability of the organization

This is how we became interested in these festivals and ceremonies by immersing ourselves in these organizations. Hence our search for theories that come closest to the case study.

Our method of work is based on Pettigrew's longitudinal practices, the collection of data related to processual, comparative, pluralistic, historical and contextual aspects. The collection of numerical data shows the mobilization of the actors and legitimizes the ideas of transformation and continuity of the organization. This is possible thanks to our actions and our immersion in the field in a structural anthropological approach of Lévi Strauss.

Morgan's images, Mintzberg's structures, Pesqueux's figuration and representation model gave us the starting and ending nature of the Laotian diaspora.

What do the principles of diaspora organization bring to the management sciences given the relationship to time? On the one hand, there is a local adaptation, young people in America are not like in France, so there is a configurational phenomenon which, at the same time, does not change the diaspora as such. On the other hand, there is also that which relativizes and questions the belonging to the diaspora. The approach figurative goes complete an approach configurational to explain the existence of the Diaspora so that entity that is going survive over time because they are not relations but belonging to the same body, a common ideology, values shared that goes enable people to participate. In same time, the approaches figurative and configurational show the limits in relation to the relation to the objective, the goal, the missions.

“IS UNCERTAINTY AVOIDANCE THE NEW TABOO DIMENSION?”**RESPONSIBLE LEADERSHIP AND UNCERTAINTY AVOIDANCE****INDEX (UAI) IN LUXEMBOURG****Schinzel, Ursula**

Unicaf University

ABSTRACT

Purpose: The aim of the present study is the combination of three different studies with the final aim to shed lights on the links between Responsible Leadership and the Uncertainty Avoidance Index (UAI) developed by Hofstede (1998, 2001) in Luxembourg. The main research question is: “Does the high uncertainty avoidance affect international cooperation because of the tendency for high-uncertainty avoidance societies to avoid the ambiguity and uncertainty that exist more in international business transactions than in domestic transactions?” This is compelling because it seems as if Uncertainty Avoidance was a new Taboo Dimension.

Design: This is the combination of three different studies: The first one was mainly performed in 2011, the second one in 2015 and the third in 2018. From the first study, a quantitative study with 134 respondents, the results about UAI were taken and combined with the 2017 qualitative study, where 51 semi-structured interviews were conducted in four culturally different samples, namely: (1) Luxembourgers with Luxembourgish Nationality (Lux.Nat.), (2) foreigners who reside in Luxembourg (Lux.Foreigner), (3) cross-borderers, and (4) the rest of the world (World). These results were compared with the results from the 2018 study, where 40 respondents from the same 4 samples were interviewed.

Findings: Responsible leadership spans three areas: first the ecological, second the social and human, and third the economic/business area; these areas are long- or short-term oriented. The high Uncertainty Avoidance Index is mainly held responsible for being the brake to much-needed change and innovation. Critics call for precisely this change and innovation, blaming the high UAI for constituting an obstacle to it. In their opinion, there is an urgent need for managers to learn responsible leadership and overcome the UAI.

The main outcome of the respondents' responses is the fact that language is THE key to success. The Luxembourgish language is used as an identifier, subject to the author's earlier publications (2013, 2014a, 2014b). However, Luxembourgers are a culture apart, on the one hand sticking to their old traditions, avoiding any change, on the other hand forerunners in innovation and advancement, peace and European integration, space, satellite technology.

The lack of talent, especially the lack of talent in speaking Luxembourgish, is one of the biggest issues to be solved in the future.

Research implications: This article contributes to the discussion on change and innovation in the field of leadership theory, first with particular emphasis on the cultural dimension Uncertainty Avoidance following Geert Hofstede and the GLOBE, second on responsible leadership following Michael Maccoby, and third on multilingual and multicultural Luxembourg in the middle of Europe, following Geert Hofstede and Edgar Schein.

Originality: This study is the combination of research about responsible leadership and Hofstede's cultural dimension Uncertainty Avoidance (UA).

Keywords: Responsible leadership, Hofstede's cultural dimension Uncertainty Avoidance, Cross-cultural management, International business, Change and Innovation, Luxembourg

1. INTRODUCTION

The purpose of this research is to shed lights on the links between Responsible Leadership and Hofstede's cultural dimension Uncertainty Avoidance in Luxembourg. The author would like to explore (i) the effects of uncertainty avoidance on international cooperation, and (ii) the role of culture and leadership in this relation.

The research questions are: What is the link between 'responsible leadership' and 'uncertainty avoidance' in Luxembourg? Does the high Uncertainty Avoidance affect international cooperation because of the tendency for high-uncertainty avoidance societies to avoid the ambiguity and uncertainty that exist more in international business transactions than in domestic transactions? Please give some examples. "Is Uncertainty Avoidance the new Taboo Dimension?"

Geert Hofstede (1998) wrote about the taboo dimension masculinity and femininity as long ago as 1998. Many things have changed since then. One of the changes might be that the new taboo dimension is 'uncertainty avoidance', besides Hofstede's taboo dimension 'masculinity versus femininity'. Because of the overall tendency towards globalization, internationalization and international trade, uncertainty avoidance tends to be less popular as a cultural dimension as it prevents ambiguity and uncertainty in international business transactions, preferring domestic transactions. Is this correct? Do you know any examples? Or, is it taboo to be uncertainty avoidant?

The present research takes an initial step in this direction: "Is Uncertainty Avoidance the new Taboo Dimension?"

The author would like to cite Hofstede (2001) and Shenkar (2001) in Venaik and Brewer (2010): "UA is expected to affect international cooperation because of the tendency for high-UA societies to avoid the ambiguity and uncertainty that exist more in international business transactions than in domestic

transactions". This relationship between high UA and international business transactions avoidance remains to be verified.

134 questionnaires were collected in the 2011 replication of the VSM2008, 51 semi-structured interviews were conducted in 2015 and 40 semi-structured interviews in 2018 among four culturally different samples, namely: (1) Luxembourgers with Luxembourgish Nationality (Lux.Nat.), (2) foreigners who reside in Luxembourg (Lux.Foreigner), (3) people from Germany, France, and Belgium who commute daily to work in Luxembourg (cross-borderers), and (4) the rest of the world (World). Convenience sampling was used. In 2015 respondents were asked: What is 'responsible leadership' in Luxembourg? In 2018 respondents were asked: A) What is the link between 'responsible leadership' and 'uncertainty avoidance' in Luxembourg? B) Does the high Uncertainty Avoidance affect international cooperation because of the tendency for high-uncertainty avoidance societies to avoid the ambiguity and uncertainty that exist more in international business transactions than in domestic transactions? C) Please give some examples. D) "Is Uncertainty Avoidance the new Taboo Dimension?"

With the current research the author contributes to the existing knowledge by developing the theory of need for change and innovation (Santoro, Ferraris, & Winteler, 2019).

The author combines two existing theories, namely on Culture (Hofstede, Hofstede, & Minkov 2010) and on Responsible Leadership (Maccoby, 2011).

Why Luxembourg? Because it provides the author with a steady cultural environment where other sub-cultures might vary in their behaviour (France, Germany, Belgium, Portugal, Italy, Spain...).

This research is significant and strongly needed as a reinforcement of the claim for change and innovation in the field of responsible leadership theories.

After this introduction, the paper will describe Luxembourg's linguistic and cultural peculiarities. The third paragraph is a brief literature review on Responsible Leadership, fourth on Hofstede's cultural dimension 'Uncertainty Avoidance'. Paragraph 5 is on Responsible Leadership and Uncertainty Avoidance, and the author offers a proposition. Paragraph 6 will describe the applied method: the combination of three different studies with 134 questionnaires in 2011, 51 semi-structured interviews in 2015 and 40 semi-structured interviews in 2018. Paragraph 7 will present the results from the four culturally different samples of respondents, and excerpts of some interviews. Paragraph 8 will show a summary table on responsible leadership and Hofstede's maps of the world with a discussion of the results in these maps. Paragraph 9 contains the conclusions, discussion, and implication, as well as research limitations and further research opportunities. References and Appendix with the original interview will conclude this paper.

2. LUXEMBOURG

Luxembourg is a parliamentary democracy and a constitutional monarchy, and it is the only remaining Grand Duchy in the world. As of 1st of January 2017, Luxembourg's total population consisted of 590,700 inhabitants of whom 309,200 (52.34%) were Luxembourgers and 281,500 (47.66%) were foreigners (statec, 2017a); these included 96,800 Portuguese, 44,300 French, 21,300 Italians, 20,000 Belgians, 13,100 Germans, 6,100 British, 4,300 Dutch, 34,400 other EU countries, 41,200 other (see <http://www.statistiques.public.lu/stat/TableViewer/tableView.aspx>). Cross-borderers are a distinguishing characteristic of Luxembourg's employment situation. Domestic employment was 418,400, comprising 176,600 cross-borders (42.21%): 88,600 from France, 43,800 from Belgium, and 44,200 from Germany.

Depending on the tools and measures taken, the answer to the question: "How is life in Luxembourg?" differs: According to the Better Life Index, Luxembourg ranked 13th among OECD countries and 9th among European countries in 2016 (STATEC, 2017b, p.23). According to the World Bank, Luxembourg had the largest Gross National Income per capita in 2015 evaluated at purchasing power parity among the Organisation for Economic Cooperation and Development (OECD) countries (The World Bank, 2016) (STATEC, 2017b, p. 21).

"Eurobarometer data documents that Luxembourg's residents are mostly satisfied with their homes (93% of satisfied respondents), family lives (94% of satisfied respondents), neighbourhoods (91% of satisfied respondents) and social lives (92% of satisfied respondents), whereas they are less satisfied with the health care system (77% of satisfied respondents), income (85% of satisfied respondents), and personal safety (85% of satisfied respondents). It is worth emphasising, however, that this study refers to 2004. In 2013, Eurofound (2013) reported that Luxembourg's residents are the most satisfied with their life after Danish, Finnish and Swedish people. This is the result from the analysis of life satisfaction trends in Europe, which uses data from the European Quality of Life Surveys conducted in 2003, 2007 and 2012." (STATEC, 2017b, p. 22).

"According to the World Happiness Report, Luxembourg scored 18th out of the 155 countries taken into account world-wide in 2017. The best performers in 2017 are Norway, followed by Denmark, Iceland, and Switzerland. These countries rank consistently on top thanks to their high values in all the key variables used to explain happiness differences among countries and through time, namely income, healthy life expectancy, having someone to count on in times of trouble, generosity, freedom and trust (STATEC, 2017, p. 26).

Luxembourg's motto is: '*Mir wëlle bleiwe, wat mir sinn*' [*We want to remain what we are*]. Luxembourg is one of the smallest countries in Europe with a total size of 2,586 km². It is 82 km long and 57 km wide and has borders with Germany (138 km), with France (73 km), and with Belgium (148 km) (The World

Factbook, n.d.). The language situation is anchored deeply in the country's history (Schinzel, 2013). There are three official administrative languages: French, German, Luxembourgish (statec, 2017a), Luxembourgish (Lëtzebuergesch) being the national language. The public education system is trilingual: the instruction language in Kindergarten is Luxembourgish, being replaced by German as language of instruction in primary school and then gradually replaced by French in secondary school (Kraemer, 1995; Schinzel, 2014a; 2014b; Weber and Horner, 2008). Citizenship is only awarded to those who speak Lëtzebuergesch (Spizzo, 1995).

3. RESPONSIBLE LEADERSHIP

"There is only one irrefutable definition of a leader: someone people follow. Therefore, leadership is a relationship between the leader and the led. Unlike management, the leadership relationship cannot be delegated or automated" (Maccoby, 2011).

Responsible leadership is defined as being "about making business decisions that, next to the interests of the shareholders, also takes into account all the other stakeholders such as workers, clients, suppliers, the environment, the community and future generations" (The Financial Times, n.d.). Stükelberger and Mugambi (2007) split 'Responsible Business Leadership' into 5 aspects: 1) in general, 2) economically, 3) socially, 4) politically and 5) environmentally. Responsible leadership has increasingly been a topic of interest in recent years, looking into topics like 'organizational culture' (Schein 2009, 2010), 'strategic intelligence' (Maccoby, 2015), 'raising performance through uplifting leadership' (Hargreaves et al., 2014), 'stakeholders' (Maak, 2007; Maak & Pless, 2006), strategic leadership (Elenkov, D.S., Judge, W., & Wright, P., 2005), supportive leadership (Banai & Reisel, 2007), different types of leadership approaches (Northouse, 2012), and 'narcissistic leaders: who succeeds and who fails' (Maccoby, 2007). Northouse (2012) addresses the subject through different types of approaches: the trait approach, skills approach, style approach, situational approach, contingency theory, path-goal theory, leader-member exchange theory, transformational leadership, servant leadership, authentic leadership, team leadership, psychodynamic approach, women and leadership, culture and leadership, and leadership ethics. Murray (2010) asks: "What makes a great leader?"

Maak (2007, p. 329) argues that responsible leadership 'contributes to building social capital and ultimately to both a sustainable business and the common good'; this is because business leaders have to build 'enduring and mutually beneficial relationships with all relevant stakeholders' through 'durable relational structures and ultimately stable networks of relationships'. For Maak (2007, p. 339), the responsible leader is a weaver of value networks, contributing with these social ties to a sustainable business, the common good and eventually to a sustainable future. Pless (2007, p. 438)

defines it as follows: “We understand responsible leadership as a values-based and thorough ethical principles-driven relationship between leaders and stakeholders who are connected through a shared sense of meaning and purpose through which they raise one another to higher levels of motivation and commitment for achieving sustainable values creation and social change.” She defines “a responsible leader as a person who reconciles the idea of effectiveness with the idea of corporate responsibility by being an active citizen and promoting active citizenship inside and outside the organization” (Pless, 2007, p. 450). Responsible leaders build sustainable relationships with stakeholders, to achieve shared objectives, the common good. This includes the different streams of leadership: ethical, authentic, servant and transformational. “Sustainability is about building a society in which a proper balance is created between economic, social and ecological aims” (Szekely & Knirsch, 2005, pp. 628, 629), where “companies integrate their economic, social and environmental objectives into their business strategies and optimize the balance among all three. Thus, the flexibility to change and to engage in dialogue and partnerships with different members of society are not given to all leaders. Internal factors (managers, employees, workers, worker health and safety, shareholder value) and external factors (market, government, stakeholders, energy efficiency) determine sustainability within a company. Szekely and Knirsch (2005) name the critical success factors to achieve sustainability as: first, leadership and vision; second, flexibility to change; third, openness, i.e. stakeholder engagement.

The authors would like to cite Voegtlin, Patzer and Scherer (2012, p. 6): “Leaders (and followers alike) are increasingly confronted with heterogeneous cultural contexts, devoid of shared moral orientations or legal frameworks. As moral or ethical conflicts arise in the process of economic activities, business leaders are left without any orientation in regard to morally adequate action. In this situation the idea of value maximization often becomes the sole surrogate for moral principles. This problem is aggravated by the need to transcend the traditional, internally bound focus of leadership theory.” (Maak, 2007; Maak and Pless, 2006b).

Clarke and Liesch (2017, p. 924) define the *wait-and-see* strategy in the Internationalization Process (IP) “as a strategy resulting from a measured decision in the firm to maintain current commitments to its business relationships”, where the responses to pressures from an increasingly globalized international business world are the following behaviors: avoiding uncertainty, showing “institutional inertia”, and/or “locational immobility. The desired outcomes are long-term sustainability, improved competitiveness, and managed risk.

4. GEERT HOFSTEDE'S CULTURAL DIMENSION 'UNCERTAINTY AVOIDANCE'

The author replicated Geert Hofstede's cultural dimensions study in Luxembourg in 2011 as her doctoral thesis and compared the findings with Hofstede's estimates. Luxembourg's specific cultural environment is characterized by low Power Distance (PDI=29), high Uncertainty Avoidance (UAI=95), low Individualism = high Collectivism (IDV=34) (COL=66), medium Masculinity (MAS=54), high Long-Term Orientation (LTO=65), medium Indulgence versus Restraint (IVR=55), and low Monumentalism (MON=24).

In international trade, "companies must adapt their assortment, their collections, and their retail concepts". This is about "cultural distance and local adaptation: The necessity of adapting. Wherever a company comes from, great chances exist to encounter cultural differences...." Feldmann (2016, pp. 14-15).

Table 1 (Schinzel, 2017a) shows Hofstede's (2001) and Hofstede et al.'s (2010) cultural dimensions of Lux.Nat. and Lux.All., Hofstede's estimates for Luxembourg, his data for France, Germany, the UK, Belgium FR, Belgium NL, Italy, the Netherlands, China, the USA and Japan (on a scale from 1-100, 1 being the lowest and 100 the highest score), where the cultural differences become clear.

Table 1 Cultural Comparisons (Schinzel, 2017a): Hofstede's (2001) and Hofstede et al.'s (2010) cultural dimensions of Lux.Nat. and Lux.All., Hofstede's estimates for Luxembourg, his data for France, Germany, the UK, Belgium FR, Belgium NL, Italy, the Netherlands, China, the USA and Japan (on a scale from 1-100, 1 being the lowest and 100 the highest score), where the cultural differences become clear.

Venaik and Brewer (2010), in their table 1 'A review of the Uncertainty Avoidance (UA) construct in international business', enumerate the key results from the many studies in the field of UA and their effect on international joint ventures. This current research does not want to enter into competition with existing research but to add to the existing knowledge, as neither Hofstede (2001) nor the GLOBE (House et al., 2004) examine Luxembourg. This is the author's contribution to knowledge.

In the following paragraph we will look at the results from the 2011 study, the author's doctoral thesis. In 2011, the author used Geert Hofstede's VSM2008 - Value Survey Module - as a questionnaire to replicate Hofstede's research in Lindab Luxembourg. The author had initially wanted to replicate Hofstede's study in IBM Luxembourg, but this was unfortunately not possible. Luckily, the company Lindab agreed to participate in this doctoral study.

The questions that Geert Hofstede (2001, p. 148) uses to measure Uncertainty Avoidance are:

"How often do you feel nervous or tense at work? (1. Always....5. never)

How long do you think you will continue working for this company? (1. Always.....5. never)

Company rules should not be broken – even when the employee thinks it is in the company's best interests. (1. Strongly agree....5. Strongly disagree).

One can be a good manager without having a precise answer to every question that a subordinate may raise about his or her work (1. Strongly agree.... 5. Strongly disagree).

Competition between employees usually does more harm than good. (1. Strongly agree... 5. Strongly disagree).

All in all, how would you describe your state of health these days? (1. Very good.... 5. Very poor)."

The author's results are shown in Geert Hofstede's maps of the world.

5. RESPONSIBLE LEADERSHIP AND UNCERTAINTY AVOIDANCE

Hofstede (2008) defines Uncertainty Avoidance as "the extent to which the members of institutions and organizations within a society feel threatened by uncertain, unknown, ambiguous or unstructured situations". Earlier, in 2001, page 148, he provides the following definition: "Uncertainty-avoiding cultures shun ambiguous situations. People in such cultures look for structure in their organizations, institutions and relationships, which makes events clearly interpretable and predictable."

Stability, peace and freedom are key in Luxembourg. Luxembourg's motto is: "Mir wëlle bleiwe wat mir sinn" – "We want to remain what we are". If one does not understand the full extent of this motto, it is difficult to integrate into Luxembourg's culture. Economic, social and political stability are key and allow for security and life predictability in the long term.

Luxembourgers say that when everything unimportant is taken care of, one can concentrate on the real joys of life.

It is worth citing Hofstede himself: "... Luxembourg has a high score on uncertainty avoidance which means that as a nation they are quite reluctant to test unknown territories. Security is a key word in Luxembourg: there is not one activity which is not dependent on some sort of security control from authorities; from banker's money to safety exits in a restaurant. It makes life in Luxembourg very safe,

but some would argue a bit boring. New ideas, new methods, new management techniques must first be proven to work in other countries in order to be accepted in Luxembourg. Historically more “farmers” than “traders”, the inhabitants kept that good old “common sense” made of cautiousness which has proven to be profitable for a country who managed not to be at war since the Napoleonic time! (<http://geert-hofstede.com/luxemburg.html>).

The following proposition is offered:

Luxembourg’s high cultural dimension ‘Uncertainty Avoidance’ influences ‘What is responsible leadership?’ Following Hofstede (2001) and Shenkar (2001) in Venaik and Brewer (2010), the author offers the following proposition: “Luxembourg’s high Uncertainty Avoidance is expected to affect international cooperation because of the tendency for high-UA societies to avoid the ambiguity and uncertainty that exist more in international business transactions than in domestic transactions.

6. METHODOLOGY

For the purpose of this research, the results from three different studies were combined: the 2018 qualitative study with 40 respondents, the 2011 quantitative study with 134 respondents and the 2015 qualitative study with 51 semi-structured interviews.

For the 2011 study, respondents were given Hofstede’s questionnaire VSM08 – Values Survey Module 2008, available at <http://geerthofstede.nl>.

For the 2018 and the 2015 research, respondents were from the four culturally different categories: Lux.Nat. (29), Lux.Foreigners (25), Cross-Borderers (16) and the rest of the World (21). Interviews were carried out in Luxembourgish, English, French, German and Italian. The interviews were fairly heterogeneous, as they were in person, by phone, via skype or email exchange and lasted between 15 minutes and 2 hours. For confidentiality reasons, interviews were not taped, recorded or filmed. In-depth notes were taken during the interviews. After the interviews, the respondents were presented with a summary of the interview and asked for their consent. Interviews in Luxembourgish, French, German, Italian or Spanish were translated into English.

7. RESULTS FROM THE 2018 RESEARCH

The results from the 2018 research are shown in this paragraph. Table 2 summarizes the respondents’ demographics.

Table 2 Respondents' demographics (N=40)

Respondents' profile	Classification	Number of respondents
Gender	Male	18
	Female	22
	Total	40
Age	0-24	0
	25-34	2
	35-49	13
	Over 50	25
Industry sector	Banking and Finance	12
	Education, Human Resources	14
	Tourism, Food, Petrol, Politics, Telecom, Construction	2
	Law, Medicine, Journalism	10
	Civil Servants	2
Education level	A-level and professional education, undergraduates	8
	Masters and Doctorates	32

In total, the 40 respondents come from 15 different countries and speak 16 different languages, four holding double nationality: French + Dutch, German + Dutch, German + Luxembourgish, and German + French.

Native languages are: Luxembourgish (10), French (6), English (6), Italian (5), German (5), Portuguese (2), Dutch (2), Russian (1), Hebrew (1), Bosnian (1), Bulgarian (1), with 2 respondents having 2 mother tongues: French + Dutch (1), French + German (1). 1 respondent speaks seven languages, 2 speak 6 languages, 3 speak 5 languages, 5 speak 4 languages, 2 speak 3 languages, 3 speak 2 languages, and 4 respondents speak one language (1 French and 2 English).

The citations from the 2018 study best show the research results. Therefore the responses from the four different samples are reprinted hereafter.

The main result from the respondents is the fact that language is THE key to success. The Luxembourgish language is used as an identifier, subject to the author's earlier publications (2013, 2014a, 2014b). However, Luxembourgers are a culture apart, on the one hand sticking to their old traditions, avoiding any change, on the other hand forerunners in innovation and advancement, peace and European integration, space, satellite technology. The lack of talent, especially the lack in talent speaking Luxembourgish is one of the biggest issues to be solved in the future. Another dilemma must be eluded here: Lux.Nats work for the State as civil servants. There are hardly any Lux.Nats working for the private sector. Cross-Borderers and Foreigners work for the private sector.

Luxembourg has no such people with a 'migration background', there are either Lux.Nats or Foreigners. However, in Luxembourg, the difference is determined by social class, either you belong to the right social class or you do not.

Please see the citations hereafter from the 4 different categories:

Citations from Lux.Nats.:

"Of course Luxembourgers prefer to hire Luxembourgers, this is because of the language. People all over the world prefer to reduce their efforts, therefore they prefer to speak their mother tongue. This is valid for the French working in Luxembourg who prefer to hire French speakers, and/or Germans hiring German speakers. The language is the identifier."

"We have to clarify what we are looking at. In Luxembourg, the Luxembourg Nationals are a minority, those who are Luxembourgers by birth representing less than 30% of the population. Adding 189.000 cross-border workers to the 71% foreigners living in Luxembourg. The real Lux.Nat has his origins in farming, is traditional and follows the saying: "Was der Bauer nicht kennt, frisst er nicht." Nearly all Lux.Nats work for the State as civil servants. There are hardly any Lux.Nats working in the private , where Foreigners and Cross-Borderers work. This is a dilemma, as Geert Hofstede excluded civil servants from his cultural study; here in Luxembourg, you will hardly find any Lux.Nats in the private sector. What counts in Luxembourg is the social class to which you are born, not whether you are foreigner or not."

"Who wants globalization? Who wants internationalization?"

"I know somebody who is a true Luxembourger, who is a manager. He has a company. He says that he has done his business for 30 years now and that he does his business the way he does and he will continue this way and he will not change.

The young people he hires all leave, because they want change, innovation. But he doesn't want to change anything or innovate. He wants to stick with his procedures and his business connections that he has since the beginning."

"I could say that responsible leadership and uncertainty avoidance are strictly connected in Luxembourg. Minimize risk, ensure financial security, reduce ambiguity: these are typical factors of the Luxembourger social fabric. I can answer that this link exists. In Luxembourg society, where "uncertainty avoidance" is very strong, the characteristic of a responsible leader is to transmit to their employees a certain idea of the future of their company, is a very strong need to establish a lasting relationship and the idea of a large family that by definition is indissoluble. I would also link this to the idea of a power distance, in the sense that, since there is also a very low power distance in Luxembourg, this makes the idea of integration even easier."

“Oh, I remember this very well! When a manager is afraid of me, because I am better than him. Because he is afraid of losing his power, his influence, his might. He will do everything to destroy me, to make all of my work/propositions/ideas look foolish. He will avoid every change, every innovation. He will stick with his old-fashioned methods, because this is all he knows, because of his stupidity. Protectionism to hide his own ignorance.”

“The best management method for Lux.Nats. seems to be the traditional way of doing things: few words, rude, impolite, never greeting anybody, squeezing the best out of people by insulting them, never positive feedback, only negative critique, low salaries. Talking to the manager means talking to him over a distance of a 3 meter long table, standing. Results are: burnout, people leaving, the need to hire new unqualified people with a need for training.”

“In the 1970s, Luxembourgers were a people ruled by security. Consensualism was cherished 100%. But then from time to time they opened up to innovation, i.e. SES, satellites and now space mining. Luxembourg is a founding member and full member of numerous international institutions: NATO, CECA, UN, 1823 Customs Union (Deutscher Zollverein). Nevertheless, the 7th June 2015 Referendum demonstrated the high importance of the UAI on a political and everyday life level. 94% voted against a right to vote for foreigners. In Luxembourg city, Luxembourgers are a minority, representing less than 30% of the population. The Luxembourgish language finds its importance as an identifier here. Luxembourgish is used as an identifier, the language gets its importance as a distinguisher.”

Citation from the Category Foreigners living in Luxembourg:

“It’s uncertainty all over!”

“Luxembourg lacks talent. There are not enough qualified people. There is no ‘Knowledge Community’, as the University only started 15 years ago. There is a top 1% that rules the country, inaccessible for the common citizen. Luxembourg seems to be an open society, but it is not. The language is the key issue. Either you speak it, then you are in the in-group, or you don’t speak it, then you are out. The foreigners work hard, they bring the talent. In my opinion, the typical Luxembourger is dying, not only his language, but also the species.”

“Why do you say they are ‘uncertainty avoidant’? I must say, I have no contact with Luxembourgers. I do not know them. I only live here. For me they are precursors of the new. They conduct space research, with space mining, they are known for their inventions in ICT, information communication technology. They are the forerunners for the European Union.”

“Let me cite Victor Hugo for you, who lived in Vianden. He stated: “There are the good people, there are the bad people, and there are the Luxembourgers”. This is to say that they are a species apart. Nobody can understand them.

Besides, I do not work with Luxembourgers. I am founder and manager of my own business. Not one single Luxembourger wants to work in our business, or in other businesses. It's too hard work. They all want to be employed by the State, which means earning a lot of money for little work. Most Luxembourgers study at a University, they come back with their diplomas and claim a highly paid position, instead of starting in a private business and learning from a boss, like me. They do not want to do that. We employ only French and Belgians. They work well, they are happy with the good work, to learn, to be treated well, and to contribute to a small private business.

Last month we were looking for a new employee. We started a hiring campaign, with ads and interviews. Not one Luxembourger applied for the open position. We had applicants from France and Belgium, but no Luxembourger."

"What is the link between 'responsible leadership' and 'uncertainty avoidance' in Luxembourg?"

In my experience, Luxembourg has a high tolerance for uncertainty and ambiguity, compared to France or Germany, for instance.

This high tolerance is due to Luxembourg's international context. A large proportion of the population comes from a foreign country and has lived in several foreign countries. These persons have been in contact with different cultures.

In companies, one can often note a strong link between foreign experience and mind flexibility + tolerance for uncertainty and ambiguity. And this is the case at all levels of the hierarchy.

This high tolerance is due to multilingualism and to the fact that a large proportion of the population uses 1, 2, 3 (or even more) foreign languages, on a daily basis, in professional and private contexts. This leads easily to communication uncertainty and ambiguity, which they are used to and can easily monitor.

This high tolerance is also due to this Luxembourgish art of making compromises. One will tolerate his/her neighbors more easily than in France or Germany for instance. Even if this neighbor behaves in an annoying way.

If Luxembourg did not exist, cross-border relationships between French, Germans and Belgians would not be as developed as they currently are; without the Grand-Duchy, at a professional level, people from these neighboring countries would not know each other nor work together.

At a personal level, French, Germans and Belgians don't travel much within the other countries of the Greater Region. Luxembourgers and people with international experience do.

On 'responsible leadership': in the small companies I worked for, whatever the culture and the nationality of the management, responsible leadership was very low, at least regarding their employees.

Luxembourgish managers tend to primarily do business with people they know: from school, from the university or from past work experiences.

But when it comes to decision-making and taking the initiative, their approach is very restrictive and does not allow new or non-conventional ideas/suggestions. Even if those could be perfectly monitored when implemented.

In the big organizations and administrations I worked for, Lux. managers and directors were rather cool toward uncertainty and ambiguity, when it came to decision making and taking the initiative.

How can 'uncertainty avoidance' block any attempt at 'responsible leadership'?: I remember some French colleagues, from Lorraine, who did not speak any German. One day, they refused to go to a 2-day training course in Paris, because this was too far and uncertain, in their opinion. Frankfurt would have been the alternative training option, on the condition that they spoke German. They did not attend the requested training. A few months later they lost their jobs as they were not employable anymore. Despite all attempts from their management to find a solution, those colleagues blocked all possible solutions raised by their management.

Does the high Uncertainty Avoidance affect international cooperation because of the tendency for high-uncertainty avoidance societies to avoid the ambiguity and uncertainty that exist more in international business transactions than in domestic transactions?

When it comes to international relationships/co-operation between Luxembourg and other States, those two above-mentioned aspects prevail.

On a business and political basis, organizations and parties – be they competitors or political opponents – gather in order to find the best solutions for the country. Decision-making and initiative-taking then go very fast and are also quickly implemented. Even when it comes to blocking international and European political, economic, fiscal measures that would have a negative impact on Luxembourg.

Please give some examples.

- Digital Lëtzebuerg

- 3rd Industrial Revolution Lëtzebuerg.”

Citations from the Category Cross-Borderers:

One respondent in the Lux.Nat. category put it this way: “The Cross-Borderer’s biggest issue on the whole is the traffic. All day they reflect on how to get back home best, and how to come to work best the next morning. They use either the train, with its uncertainty – speaking about uncertainty avoidance!!! - or the bus, again with its uncertainty, or the car, with the traffic jam for 100% certain! On the way, they are on their iphones, writing emails, writing reports, telephoning, working, writing presentations on their ipads, or they sleep, or they do their make-up, or talk to their neighbour. From

my experience, cross-border workers always arrive late in the mornings, every morning, without a word of excuse they arrive at 10 a.m., by the time they start working it is 10:30, because they are so exhausted from the traffic. In the afternoon, around 3p.m. they get nervous and want to leave before the traffic starts. Others decide to stay later to leave after the traffic. But employees with children have to leave early. They will skip lunch and work through their lunch break.”

Citation from the Category World:

“The Luxembourgers hide their ‘Uncertainty-Avoidance’. Nobody wants to admit that he/she is ‘uncertainty avoidant’. This is a taboo. They have learned from other politicians to hide their weakness.”

“I don’t know.”

In the following, we will be looking at the results from the 2015 study.

8. RESULTS FROM THE 2015 RESEARCH:

The results are shown in this paragraph. Table 3 summarizes the respondents’ demographics.

Table 3 Respondents’ demographics (N=51)

Respondents’ profile	Classification	Number of respondents
Gender	Male	25
	Female	26
	Total	51
Age	0-24	0
	25-34	7
	35-49	19
	Over 50	25
Industry sector	Banking and Finance	12
	Education, Human Resources	14
	Tourism, Food, Petrol, Politics, Telecom, Construction	15
	Law, Medicine, Journalism	10
	Civil Servants	2
Education level	A-level and professional education, undergraduates	8
	Masters and Doctorates	43

In total, the 51 respondents come from 15 different countries and speak 19 different languages, four holding double nationality: French + Dutch, German + Dutch, German + Luxembourgish, and German + Bosnian.

Native languages are: Luxembourgish (18), French (11), English (6), Italian (5), German (5), Portuguese (2), Dutch (2), Russian (1), Hebrew (1), Bosnian (1), Bulgarian (1), Swedish (1), and Polish (1), with 5 respondents having 2 mother tongues: French + English (2), French + Dutch (1), French + German (1), Swedish + Bulgarian (1). 1 respondent speaks seven languages, 2 speak 6 languages, 8 speak 5 languages, 17 speak 4 languages, 14 speak 3 languages, 5 speak 2 languages, and only 4 respondents speak one language (1 French and 3 English).

8.1 Summary results for the 2015 interviews: “What is responsible leadership in Luxembourg?”

In this 2015 study, respondents were asked: ‘What is responsible leadership in Luxembourg?’ (Schinzel, 2017b, p. 15-17). The crosses in the table show that respondents from this category, but not the other categories, mentioned this criterion.

Table 4 Interview summaries

mentioned by:	Lux. Nat.	Lux. Forgn.	Cross- Bord.	World
1) Responsible Leadership is:				
Ecological responsibility	x	x		
Social and human responsibility	x	x		
Economic/business/commercial responsibility	x	x		
Long-term (versus short-term) orientation	x	x		
The Grand Duke and the Grand Ducal Family [mentioned by Italians living in Luxembourg and by Cross-Borderers]			x	
Politicians [mentioned by Italians living in Luxembourg and by Cross-Borderers]			x	
Citizens [mentioned by Italians living in Luxembourg and by Cross-Borderers]			x	
Employing the highest standards of ethical behavior				x
Corporate Social Responsibility (CSR)				x
2) Examples for Responsible Leadership are:	Lux. Nat.	Lux. Forgn.	Cross- Bord.	World
Cactus [mentioned as irresponsible by Lux.Foreigners]	x		x	
Luxair [mentioned as irresponsible by Lux.Foreigners]	x		x	
Luxlait			x	
Goodyear			x	
SES Astra	x	x	x	
CFL Multimodal	X	X	x	

Delphi [by hiring locally but also expatriates, contributing to an ideal mixture and diversity]			x	
The current Government and Prime Minister [mentioned as irresponsible by Lux.Nat.]		x	x	
Me, I hope [mentioned as responsible only, never as irresponsible]	x	x		
My boss [mentioned as both: responsible and irresponsible]	x	x	x	
The trilingual public education system [mentioned also as irresponsible]	x			
My father			x	
Jean-Claude Juncker [mentioned also as irresponsible]			x	
The Grand Duke and the Grand Ducal Family [mentioned by Italians living in Luxembourg and by Cross-Borderers]			x	
Politicians [mentioned by Italians living in Luxembourg and by Cross-Borderers]			x	
Citizens [mentioned by Italians living in Luxembourg and by Cross-Borderers]			x	
5) Typical for Luxembourg is:	Lux. Nat.	Lux. Forgn.	Cross- Bord.	World
Multilingual	x	x	x	
Multicultural	x	x	x	
The Cross-Borderers	x	x	x	
Diversity	x	x	x	
High standard of living	x	x	x	
Rich, high GDP				x
The small size: limitations due to its small size, limited resources and small projects	x	x		
The trilingual public education system				
It's a great place to live and/or work [mentioned only by cross-border workers, not by Lux.Nat., nor by Lux.Foreigners]			x	
There are too many irresponsible leaders in Luxembourg [mentioned by Lux.Nat. as a criticism of the foreign banks and financial institutions?]	x			
Banks, financial institutions, special laws and rules	x	x	x	
Money laundering, banking secrecy (now finished)				
Bullying and harassment at work is frequent	x	x		
(Sports) Clubs, associations, teams	x	x		

Overly expensive housing prices, real estate	x	x		
Tourism, beautiful nature and Luxembourg City	x	x		
Good social and medical system and health care	x	x		
Nepotism				
Everybody knows everybody (and everything)	x	x		
Quick and easy contact	x	x		
Tourism, beautiful nature and Luxembourg City	x	x		
Tolerance of what is different			x	
Integration not separation			x	
The good working conditions in general, where forecasts are met by reality (not the case in my home country).			x	

“Respondents named the following attributes of responsible leadership: the three big categories: ecological, social and human, economical responsibility, followed by long-term and short-term orientation, personal capabilities, getting results, interpersonal skills, trust, ethical behavior, security, respect, fairness, reliability, doing not talking, commitment, compassion, keeping your promises, and finally corporate social responsibility.

Respondents named the following attributes as typical for Luxembourg: multilingual, multicultural, cross-cultural management, cross-border workers, diversity, tolerance of what is different, integration instead of separation, rich and highest GDP, high salaries, low taxes, banks and financial institutions, European institutions, money laundering, banking secrecy (now finished), good working conditions in general, good social and healthcare system, where forecasts meet reality, difference in legislation for the five different samples of people (Lux.Nat., Lux.Foreigners, Cross-Borderers, World, and Civil Servants), limitation due to small size and limited resources, trilingual public education system, a great place to live and/or work, (sports) clubs, associations, teams, expensive housing prices, quick and easy contact, given that everybody knows everybody and everything, therefore nepotism, too many irresponsible leaders, beautiful nature and tourism, social events like Schueberfouer (Schinzel, 2017b, p.22).”

8.1 The author's results in Hofstede's map Masculinity versus Uncertainty Avoidance.

Figure 1 The author's results in Hofstede's maps, in Hofstede's figure 6.1 Masculinity versus Uncertainty Avoidance (Hofstede et al., 2010, p. 214)

Lux. Nat. is found in the lower middle-right quadrant, positioning it next to Hofstede's Belgium FR, Malta, Belgium NL and Lindab Luxembourg, showing the difference from Hofstede's Luxembourg. The difference is that Lux. Nats. are strong Uncertainty Avoidance scorers (UAI=95). Lux. Nats. are afraid of any uncertainty. For Lux. Nats. everything must be planned, organised, regulated, restricted and foreseen. Nothing has been left to chance. Lux. Nats. hate surprises. They prefer that every day is the same and every year brings the same events with always the same people at the same place and the same procedure. They distinguish themselves from their mighty neighbours Germany/France/Belgium, and they have created their own language (Briley, 2005; Hong, 2000), habits (Spizzo, 1995), peculiarities (IPSE, 2010; Haag, 2011), that they hold to strongly as if they were their identity savers (Hermans & Kempen, 1998) or their rescue plan. Concerning Masculinity/Femininity, Lux. Nats. score around the middle on Masculinity (MAS=54), which would be mid-scorer on Feminism (45). Achievement and success are as dominant as caring for others and quality of life. The masculinity/femininity dimension has been analysed by Kanayama and Cooper-Chen (2005), on the occasion of the pregnancy of Princess Masako in Japan, by Hofstede (1998) and Inglehart (2011) and Trompenaars et al. (1998) in particular. The Uncertainty Avoidance dimension has been analysed by Hofstede (2001) and McClelland (1961), Bond (2004), de Mooij (2011), Venaik and Brewer (2010) and Inglehart (2000).

Lindab Luxembourg is found in the lower middle right quadrant, positioning it next to Lux. Nat., showing a high Uncertainty Avoidance Index (UAI=97) and a mid-masculine / mid-feminine culture (MAS=47), standing for 53 Feminism. The analysis for this is the same as for Lux. Nat., see above.

Hofstede's Luxembourg still has a high Uncertainty Avoidance Index (UAI=70), but mid-high Masculinity (MAS=50) standing for a Feminism of 50 ($100-50=50$), and is positioned next to Pakistan and Taiwan.

Lindab France is found in the upper left, middle quadrant, next to Hofstede's Vietnam. Lindab France scores low on Uncertainty Avoidance (UAI=28.8) and lower on Masculinity (MAS=43.5), representing a higher Feminism Index ($100-43.5=56.5$). Lindab France differs from Hofstede's France in Uncertainty Avoidance which has a higher Uncertainty Avoidance Index (UAI=86) and low Masculinity (MAS=43), standing for high Femininity ($100-43=57$). They do not differ in Masculinity/Femininity, but do differ in Uncertainty Avoidance. Hofstede's France is positioned in the lower left quadrant next to Panama, Peru, Spain, Turkey, Korea, Bulgaria, whereas Lindab France is positioned in the upper left quadrant. As mentioned previously, this divergence from Hofstede's France is due to several facts. First, at Lindab France, we are looking at 10 people only, a sample reduced in numbers, which could cause errors. Second, at Lindab France, we are looking at the

company level, and not really at the nation level. Lindab France is influenced culturally by Lindab in general and by the migration background of its employees.

Lindab Germany finds its position right next to Hofstede's Germany. Lindab Germany is high on Uncertainty Avoidance (UAI=67.5) and high on Masculinity (MAS 64.5) standing for low Femininity (100-64.5=35.5). Hofstede's Germany is quite the same with high Uncertainty Avoidance (UAI=65) and high Masculinity (MAS=66) standing for low Femininity (100-66=34). Germany is a country whose people feel threatened by uncertainty and ambiguity and try to avoid these situations and look more for achievement and success. They are less occupied with caring for others and quality of life is not so important.

8.2 The author's results in Hofstede's map Uncertainty Avoidance versus Individualism

Figure 2 The author's results in Hofstede's maps, in Hofstede's figure 6.2 Uncertainty Avoidance versus Individualism (Hofstede et al., 2010, p. 218)

Lux. Nat. is found in the upper right quadrant, positioning it next to Hofstede's Greece, Turkey, Bulgaria, Portugal, showing the difference from Hofstede's Luxembourg. See explanation in the above figure.

Concerning Individualism/Collectivism, Lux. Nats. score high on Collectivism (100-34=66), scoring low on Individualism (IDV=34). Lux. Nats. are collective people, they have many friends and are active in sports, in clubs, in events, in outings in the evenings, week-ends and on vacation. The Uncertainty Avoidance dimension has been analysed by Hofstede (2001) and McClelland (1961), Bond (2004), de Mooij (2011), Venaik and Brewer (2010) and Inglehart (2000) in particular. The Individualism/Collectivism dimension is Hofstede's most analysed dimension, especially by Triandis (1995), Venaik and Brewer (2011), Schwartz (1990), and Briley (2001).

Lindab Luxembourg is found in the middle and to the right, positioned a bit below Lux. Nat., showing a high Uncertainty Avoidance Index (UAI=97) and a mid-individualist / mid-collectivist culture (IDV=51.5), standing for 48.5 Collectivism. The analysis is the same as for Lux. Nat., and Lindab Luxembourg includes all the foreigners and Lux. Nat.. The high percentage in foreigners changes the score for the pattern.

Hofstede's Luxembourg has a much lower, but still high, Uncertainty Avoidance Index (UAI=70), and mid-high Individualism (IDV=60) standing for a Feminism of 40 (100-60=40), and is positioned next to Lithuania and the Czech Republic. Hofstede included the foreigners in his estimates, and he excluded the civil servants. As 42% of Luxembourgers work as civil servants, further research is needed in this domain. This study has also had to exclude civil servants.

Lindab France is found in the upper left quadrant. Lindab France scores low on Uncertainty Avoidance (UAI=28.8) and lower on Individualism (IDV=41), representing a higher Collectivism Index (100-41=59). Lindab France differs from Hofstede's France in Uncertainty Avoidance which has a higher Uncertainty Avoidance Index (UAI=86) and high Individualism (IDV=71), standing for low Collectivism (100-71=29). They differ in Uncertainty Avoidance and Individualism Indices Hofstede's France is positioned in the lower right quadrant next to Belgium FR, whereas Lindab France is positioned in the upper left quadrant. Lindab France's divergence from Hofstede's France is due to several facts. First, at Lindab France, we are looking at 10 people only, a sample reduced in numbers, which could cause errors. Second, at Lindab France, we are looking at the company level, and not really at the nation level. Lindab France is influenced culturally by Lindab in general and by the migration background of its employees.

Lindab Germany finds its position right next to Hofstede's Germany. Lindab Germany is high on Uncertainty Avoidance (UAI=67.5) and high on Individualism (IDV=65.5) standing for low Collectivism (100-65.5=34.5). Hofstede's Germany is quite the same with high Uncertainty Avoidance

(UAI=65) and high Individualism (IDV=67) standing for low Collectivism (100-67=33). Germany is a country whose people feel threatened by uncertainty and ambiguity and try to avoid these situations, giving greater priority to looking after themselves and their immediate family only, rather than belonging to other in-groups that look after them in exchange for loyalty.

8.3 The author's results in Hofstede's map Power Distance versus Uncertainty Avoidance

Figure 3 The author's results in Hofstede's maps, in Hofstede's figure 9.1 Power Distance Versus Uncertainty Avoidance (Hofstede et al., 2010, p. 303)

Lux. Nat. is found in the lower left quadrant, near none of the other countries, next to Lindab Luxembourg, showing the difference from Hofstede's Luxembourg. The difference is that Lux. Nats. are strong on Uncertainty Avoidance (UAI=95) and weak on Power Distance (PDI=29), like no other country in the world. See explanation in the above figure.

Concerning Power Distance, Lux. Nats. are low scorers in Power Distance (PDI=29). Considering the collective activities and the small size of the country, they encounter their boss at the same places, shopping centres, events, among the same friends and at the same outings. The Uncertainty Avoidance dimension has been analysed by Hofstede (2001) and McClelland (1961), Bond (2004), de Mooij (2011), Venaik and Brewer (2010), and Inglehart (2000) in particular. The Power Distance dimension has been analysed by Smith (2002, 2006 and 2008), among others.

Lindab Luxembourg is found right next to Lux. Nat. in the lower left quadrant, showing a high Uncertainty Avoidance Index (UAI=97) and a low Power Distance Index (PDI=36). The analysis is the same as for Lux. Nat..

Hofstede's Luxembourg is also in the left quadrant, but above Lux. Nat. and Lindab Luxembourg, showing still high but much lower Uncertainty Avoidance Index score (UAI=70) instead of 97 or 95 and mid-low Power Distance Index score (PDI=40), and is positioned next to Hofstede's Germany. Hofstede included foreigners in his estimates, and he excluded civil servants. As 42% of Luxembourgers work as civil servants, further research is needed in this domain. This study has also had to exclude civil servants.

In this map Hofstede's Germany and Hofstede's Luxembourg are close, a fact that could confirm that Luxembourg and Germany are similar in culture to some extent, here in Power Distance Versus Uncertainty Avoidance.

Lindab France is found in the upper left quadrant next to Sweden and Denmark. Lindab France scores low on Uncertainty Avoidance (UAI=28.8) and low on Power Distance (PDI=32.5). Lindab France differs from Hofstede's France in Uncertainty Avoidance which has a higher Uncertainty Avoidance Index score (UAI=86) and high Power Distance (PDI=68). Hofstede's France is positioned in the lower right quadrant next to Bulgaria, Turkey, Chile, Peru, Slovenia, whereas Lindab France is positioned in the upper left quadrant. Lindab France's divergence from Hofstede's France is due to the low sample of only 10 people, and secondly, at Lindab France, we are looking at the company level, and not really at the nation level. Lindab France is influenced culturally by Lindab in general and by the migration background of its employees.

Lindab Germany finds its position right next to Hofstede's Germany. Lindab Germany is high on Uncertainty Avoidance (UAI=67.5) but not as high as 97 and around the middle on Power Distance (PDI=67.5). Hofstede's Germany is quite the same with mid-high Uncertainty Avoidance (UAI=65)

and high Power Distance (PDI=67). Germany is a country whose people feel threatened by uncertainty and ambiguity and try to avoid these situations, accepting that power is distributed unequally.

8.4 Discussion of the author's results in Hofstede's maps

The previous paragraph has shown the special place that Lux. Nat. and Lindab Luxembourg holds on Hofstede's maps, especially in two of his maps: 'Power Distance versus Individualism' and 'Power Distance versus Uncertainty Avoidance'.

Lux.Nat. and Lindab Luxembourg hold in these two cases a unique position on his maps, being surrounded by no other country in the world. On the map 'Power Distance versus Individualism', Lux. Nat. holds a unique position in the world of having strong Collectivism (100-34=66) standing for weak Individualism (IDV=34) and small Power Distance (PDI=29), like no other country in the world. On the map 'Power Distance versus Uncertainty Avoidance', Lux. Nat. and Lindab Luxembourg hold a unique position in the world of having low Power Distance (PDI=29 respectively 36) and strong Uncertainty Avoidance (UAI=95 respectively 97).

This is where it is made clear that there is no other country in the world like Luxembourg with strong Collectivism (66) (weak Individualism (34)), small Power Distance (29) and strong Uncertainty Avoidance (95). Contrary to the saying that Luxembourg is culturally close to France and linguistically to Germany, Hofstede's cultural dimension maps show the limitations of this. Concerning the cultural dimensions Indulgence versus Long-Term Orientation, Luxembourg is culturally close to France.

The specific position that Luxembourg holds on Hofstede's cultural maps is shown especially in the figures Power Distance versus Individualism and Power Distance versus Uncertainty Avoidance, which show the specific place that Luxembourg holds, being positioned in these figures in a quadrant without any other countries around it. This shows Luxembourg's special cultural dimensions: strong Collectivism - weak Individualism, small Power Distance, strong Uncertainty Avoidance, like no other country in the world. Contrary to the belief that Luxembourg is culturally close to France and linguistically to Germany, Hofstede's cultural dimensions show the specific cultural dimensions in Luxembourg: taking into account only the cultural dimensions Indulgence versus Long-Term Orientation, Luxembourg is culturally close to France.

Why is Luxembourg the way it is? Why are Luxembourgers with Luxembourgish nationality the way they are? In the preceding paragraphs, the focus was on working out the pattern of the Luxembourger. Now it is about trying to explain the way they are. There is very little research in general about Luxembourg. One research, in French, on history and politics in Luxembourg is from Haag (2011) with excellent photographs underlining his detailed historical overview. One recent piece of research is from IPSE (2010), in German, discussed in chapter 2, but it does not apply Hofstede.

Other research, still without using Hofstede, in Luxembourg was done by Spizzo and published in 1995.

For Spizzo (1995), - contrary to Haag (2011) who describes Luxembourg's history in detail - the important question is the following: why is Luxembourg the way it is, i.e., without a defined language, without a common big history, without "people", without a "race", without identifiable characteristics, without cultural traditions, without ancient stories, without any "Huguenots" or "Vikings", a country without any specific particularity.

History shapes the character of a nation. Haag (2011, p. 529) states that Luxembourg developed from a provincial town into a European capital, an international financial centre and a worldwide freight centre. In 2008 the Clausen zone was created for entertainment, in 2005 the Philharmonic Concert Hall was inaugurated, the MUDAM in 2006 and the Congress Centre in 2012 (Haag, 2011, p. 539). The 2010 Mercier report puts Luxembourg in 20th position among 221 towns for its quality of life (Haag, 2011, p. 541), a characteristic counted here as typical of femininity.

People as important for Europe as Robert Schumann, Jean-Claude Juncker and Jacques Santer are from Luxembourg (Haag, 2011). RTL – Radio Television Luxembourg, SES Astra – Société Européenne des Satellites, and EIB – European Investment Bank are important companies from Luxembourg, according to Haag (Haag, 2011, pp. 479-493), who says on page 464: "It is not easy to imagine how history would have evolved without Luxembourg" in Europe.

Luxembourg is squeezed between two mighty countries with a lot of power: France and Germany. There is also another neighbouring country: Belgium, in the north-west.

Luxembourgers speak three languages, sometimes four or five or even more.

Luxembourg was founded by chance 200 years ago and has been a country of immigration ever since (Spizzo, 1995).

Why did Luxembourg become one of the 12 founding members of the European Union, asks Spizzo (1995)? Such a small country is among the other 11 large and powerful countries. What is Luxembourg's special state of mind?

That is where the words "State, Nation, Fatherland" get their importance, along with the native language, the mother tongue. Luxembourg is a small nation with around 700,000 inhabitants in 2,588 square kilometres.

The Luxembourgish dynasty is much loved by Luxembourgers (Spizzo, 1995). The Grand Duke is a much loved person as well as his family. He gives his people a good life. He benefits from the confidence and the consensus of his people. The Luxembourgish citizens benefit from a lot of privileges, such as low direct and indirect taxes, low or non-existent contributions, many activities are

free of charge and many other items are cheap. For a long time unemployment was close to zero, although after the crisis of 2008 it was at a level of 5-6% in 2011.

It is important to point out that the Luxembourgish authorities are an example of long-term orientation; they were able to adapt and react to all the crises, i.e. in steelmaking and in the banking system, always with the objective of guaranteeing stability and wealth for their people. It seems as if there was an invisible line of stability and wealth that has been guaranteed throughout the centuries. Typical words for the national identity are wealth, privileges, stability through conserving the attractiveness of the country compared to neighbouring countries, because of its industry, its labour market, its fiscal benefits, the main key to the country's success.

Being part of this system and the feeling it gives is key to the country, the sense of being part of it (Spizzo, 1995).

Despite all the wars, Luxembourg still survives. Despite all the requests from the European partners for fiscal homogeneity, despite the demands to abolish the borders and the ending of banking secrecy, and the exchange of information on bank accounts, Luxembourg still survives. Luxembourg is a small country, and it is strongly attached to the rock it is built on, like a medieval defensive city (Spizzo, 1995).

Luxembourg has always stayed 'neutral'. This 'neutrality' has often been compared to Switzerland's neutrality. Luxembourg was able to stay neutral between its neighbouring countries France and Germany. Therefore the 'privileges' are seen as a unifying identifier for Luxembourgers.

After World War I the need was to assure the national identity, to make people understand why it was important to be "Luxembourgers", to give value to the concept of "citizenship", to give value and special rights to the fact of being a "Luxembourg citizen".

Only when Nazism engulfed this small country, because to the Germans this small piece of land seemed to be German, did the linguistic aspect attain its importance.

From that time the Luxembourgish language became important (Spizzo, 1995) and became the distinguishing factor between who was able to benefit from Luxembourgish citizenship and who not. Luxembourgish is more a dialect, and has more the characteristics of a dialect, especially because there is no translation of the Bible into Luxembourgish. Luxembourgish does not have a long written tradition, but it is spoken by everybody (Spizzo, 1995). The language defines the in-group (Briley, 2005) and the out-group. Whoever speaks Luxembourgish is part of the in-group, the others are not. Official documents are in French or in German. Mostly, French is for bureaucratic problems and German is for religious ceremonies. Now, this dialect, this language has become the distinguishing factor for citizenship. In order to benefit from all of the advantages of Luxembourgish nationality, one has to be able to speak Luxembourgish. 53% of the working population are foreigners. The distinction

of the “rescue” language is the citizenship that is only given to people who speak Luxembourgish (Spizzo, 1995). The language therefore gives access to the advantages of the rights of citizenship.

A call for change and innovation is heard from the respondents of this research. Despite this call for change, the high Uncertainty Avoidance Index seems to prevent any endeavour for much-needed change. This change and innovation is needed, according to the critical respondents, to implement the missing responsibility and sustainability. Toxic or irresponsible leaders being too often the reality, the authenticity of the leader is not always positive; on the contrary, sometimes it is negative. As a respondent from the category Lux.Nat. said: “There are too many irresponsible leaders in Luxembourg.” There is a call for change, to change irresponsible leaders into responsible leaders, to make them learn responsibility, sustainability, and ethics. The question is: how?

9. CONCLUSIONS, LIMITATIONS AND FURTHER RESEARCH

The purpose of this research was to explore the link between Responsible Leadership and Hofstede’s cultural dimension Uncertainty Avoidance in Luxembourg. The research questions were: Does the high uncertainty avoidance affect international cooperation because of the tendency for high-uncertainty avoidance societies to avoid the ambiguity and uncertainty that exist more in international business transactions than in domestic transactions? Please give some examples. “Is Uncertainty Avoidance the new Taboo Dimension?”

134 questionnaires were collected in the 2011 research, 51 semi-structured interviews were conducted in 2015 and 4 semi-structured interviews in 2018, among four culturally different samples, namely: (1) Luxembourgers with Luxembourgish nationality (Lux.Nat.), (2) foreigners who reside in Luxembourg (Lux.Foreigner), (3) people from Germany, France, and Belgium who commute daily to work in Luxembourg (cross-borderers), and (4) the rest of the world (World). Convenience sampling was used. The author reviewed the extant literature and reprinted parts of the interviews.

In conclusion, the author’s proposition was confirmed:

Luxembourg’s high cultural dimension ‘Uncertainty Avoidance’ influences ‘What is responsible leadership?’ Following Hofstede (2001) and Shenkar (2001) in Venaik and Brewer (2010), the author offers the following proposition: “Luxembourg’s high Uncertainty Avoidance is expected to affect international cooperation because of the tendency for high-UA societies to avoid the ambiguity and uncertainty that exist more in international business transactions than in domestic transactions.

The main result from the respondents is the fact that language is THE key to success. The Luxembourgish language is used as an identifier, subject to the author’s earlier publications (2013, 2014a, 2014b). However, Luxembourgers are a culture apart, on the one hand sticking to their old

traditions, avoiding any change, on the other hand forerunners in innovation and advancement, peace and European integration, space, satellite technology. The lack of talent, especially the lack in talent speaking Luxembourgish is one of the biggest issues to be solved in the future.

Is it a new taboo, being uncertainty avoidant? With the requirements of globalization and internationalization, uncertainty avoidance seems to be out of place. High Uncertainty Avoidance prevents international transactions, opening up for the global market and taking risks. But precisely these attributes are necessary when talking about innovation and change. It seems as if there is a call for internal change, for change from high to low uncertainty avoidance. One respondent in the category World said that Luxembourgers are hiding their 'uncertainty avoidance' because nobody wants to admit that he/she is 'uncertainty avoidant'. Therefore it is a taboo.

Internal change is needed. Internal changes are essential constituents of the internationalization process itself (Welch & Luostarinen, 1988) and changes are complex and intertwined (Lam & White, 1999; Nummela, Loane & Bell, 2006).

Characteristic for Luxembourg, in terms of Hofstede's cultural dimensions, is high Uncertainty Avoidance (UA), high Long-Term Orientation (LTO), high Collectivism (low Individualism), with a mix of three official languages: Luxembourgish, German and French. The combination of Hofstede's cultural studies – Uncertainty Avoidance (UAI) – with leadership issues is innovative and will pave the way for further research on cultural and linguistic peculiarities in Luxembourg.

Geert Hofstede (1998) wrote about the taboo dimension masculinity and femininity as long ago as in 1998. Many things have changed since then. One of the changes might be that the new taboo dimension is 'Uncertainty Avoidance'. This needs to be investigated. The present research took an initial step in this direction: "Is Uncertainty Avoidance the new Taboo Dimension?"

Future research could look into 'Corporate Social Responsibility' (Salehi, 2018), 'Innovation' (Santoro, Ferraris, & Winteler, 2019), 'International diversification' (Ferraris, Bresciani, & Del Giudice, 2016), 'Environmental Analysis' (Thrassou, 2016), combined with 'Responsible Leadership' and 'Uncertainty Avoidance'. Somehow contradictory, the variables 'Innovation' and 'Uncertainty Avoidance' are intriguing and therefore future research is needed to determine the impact of each of these cultural dimensions on responsible leadership activities and on the attractiveness of Luxembourg for leaders, for example in the choice of the country as a destination for expatriate leaders.

This research has also its limitations. The author concentrated on Geert Hofstede's research, while not looking at the GLOBE. Researching the GLOBE results on Uncertainty Avoidance could indeed enrich the research, looking into Venaik and Brewer (2010)'s differences between Hofstede's

and GLOBE's Uncertainty Avoidance. This being a mix of qualitative research with a quantitative approach, more sophisticated statistical methods could deepen the results. The managers interviewed were exclusively 'responsible leaders' in their eyes. None of the leaders interviewed said: "I am an irresponsible leader' (Schinzel, 2017b).

The outlook for the future calls for change and innovation by overcoming the high UAI in Luxembourg. New ways of thinking and acting are needed. But people in Luxembourg stick to their peculiarities. Therefore the author dares to ask: Is Uncertainty Avoidance the new Taboo dimension? As Uncertainty Avoidance prevents globalization and internationalization, it seems not to have a place in innovative Luxembourg. However, Luxembourgers with Luxembourg Nationality cling to their peculiarities like to dear life. Is this the new taboo? Do they all have to change, to innovate, to globalize, to internationalize? Or should they stick to their characteristics, as peculiar as they might be? What is responsible in one country might not be responsible in another. What is responsible leadership in Luxembourg depends on its cultural dimensions.

Everything begins with observation, and the author did this: the observation of the current situation, followed by an analysis of ideas of change and innovation for the future. In some cases, radical change is needed to comply with responsible leadership theory. Despite high Uncertainty Avoidance, there are time restrictions. Change needs time. Time is an important element. Time runs faster within an entrepreneurial firm than in a large firm or within the State. The level of Uncertainty Avoidance is important when radical change is needed. The level of uncertainty avoidance is so high and the change needed is radical.

On another note: is it internationalization that provoked the need for change, or is it the change that provoked internationalization in Luxembourg?

The social organization of the firm and time are other factors. Sequencing, timing and social factors cannot be separated and the interaction between them cannot be separated. What comes first is difficult to say. We are talking about human beings. The nature of human beings is fundamentally important in this study. Learning is also part of this process of change. Everything changes. The process is of learning, of change, of innovation. There are changes in the way people learn, and the whole process of learning changes. It is not about 'being', but about 'becoming'.

APPENDIX

Interview

“Is Uncertainty Avoidance the new Taboo Dimension?”

Responsible Leadership and Uncertainty Avoidance Index (UAI) in Luxembourg

The purpose of this research is to explore the link between Responsible Leadership and Hofstede’s cultural dimension Uncertainty Avoidance in Luxembourg.

Hofstede (2008) defines Uncertainty Avoidance as “the extent to which the members of institutions and organizations within a society feel threatened by uncertain, unknown, ambiguous or unstructured situations”. Earlier, in 2001, page 148, he provides the following definition: “Uncertainty-avoiding cultures shun ambiguous situations. People in such cultures look for structure in their organizations, institutions and relationships, which makes events clearly interpretable and predictable.”

Responsible leadership is defined as being “about making business decisions that, next to the interests of the shareholders, also take into account all the other stakeholders such as workers, clients, suppliers, the environment, the community and future generations” (The Financial Times, n.d.).

The research questions are:

- What is the link between ‘responsible leadership’ and ‘uncertainty avoidance’ in Luxembourg?
- Does the high Uncertainty Avoidance affect international cooperation because of the tendency for high-uncertainty avoidance societies to avoid the ambiguity and uncertainty that exist more in international business transactions than in domestic transactions?
- Please give some examples.
- “Is Uncertainty Avoidance the new Taboo Dimension?”

Geert Hofstede (1998) wrote about the taboo dimension masculinity and femininity as long ago as in 1998. Many things have changed since then. One of the changes might be that the new taboo dimension is no longer ‘Masculinity versus femininity’, but ‘Uncertainty Avoidance’. Because of the overall tendency towards globalization, internationalization and international trade, Uncertainty Avoidance tends to be less popular as a cultural dimension as it prevents ambiguity and uncertainty in international business transactions, preferring domestic transactions. Is this correct? Do you know any examples? Or, is it taboo to be Uncertainty Avoidant?

Thank you for your time and your response hereafter:

ABSTRACT

This paper is focused on the analysis of the best practices experience of unique technical competence management to prepare the support for proposals on the competence management improvement in modern corporations. Analysis of advanced experience of competence management has shown that currently social technologies are actively used to solve business problems. One of the most important examples of this kind of technology are electronic portals and platforms with different features, which allow to attract a large number of internal and external experts to collaborate.

The paper considers such platforms of competency management as InnoCentive, NineSigma, Yet2.com, InnovationNet (USA), Wazoku (Great Britain), HunchBuzz (New Zealand), Witology (Russia).

Keywords: Competencies; IT-solutions; Crowdsourcing; Platforms; Open innovations; Key competencies management.

INTRODUCTION

The practice of "open innovation" refers to the active collecting and use of both internal and external knowledge, projects and competencies from the market to accelerate internal innovation processes, generating own unique competencies and marketing development. In today's world, knowledge is widely distributed and therefore a company will receive the maximal effect, if it attracts (in form of purchase or licence) the results of external R&D or gathers inventions, while opening for sales or licensing its own technology simultaneously. A more enforced version of this approach encourages the intensive search and attraction of external teams to corporation's needs and the possibility to sell the services and research work of corporation's own teams to external customers. The natural way to improve this activity is to use modern IT tools. The aim of the paper is to analyze some best practices and outline the requirements for an IT platform for competencies management.

MAIN FINDINGS

The "open innovation" ideology implies that in the decision process on new competencies development a company should consider the alternative whether to develop it autonomously, within the corporation, or the competencies would be acquired on the market. Also, a company should possess a wide range of tools to find the missing knowledge on the market in case of its availability, and to sell existing competencies if they are not fully-used or if they can be sold without damage.. McManis (McManis CR, 2009) reported that the important task is to attract external demand for corporate's own developers, if they are underloaded or have the available time.

According to the modern interpretation of the "open innovation" principle, for every corporate planning period (according to its planning cycle) a company should have a clear idea which competencies it should develop internally and which competencies should be planned to be bought or taken from outside (Chesbrough, 2003).

Tikhvinsky (Tikhvinsky and Bochechka, 2013) reported that an advanced and modern way to organize the competencies management in a corporation is to create a software platform for external search and management of competencies, including a list and a classifier of competencies, or to subscribe for an existing one. This platform can also be used as a tool for organizing the collegial work of many individual experts based on the methods of expert analysis and collegial work, and can be designed to perform such tasks that in a traditional offline way, using formal project teamwork and sessions in companies could be ineffective by reason of significant money and time loss. Without a portal the data transfer and mutual connection that could be significantly more difficult and time consuming.

Gawer (Gawer and Cusumano, 2002) reported that advantages of these platforms are:

- the possibility of delivering company's problems and obtaining solutions to them from the employees or involved external specialists, even when tasks may be supplied in the form of a search for the required competencies ("ordering for innovations");
- the systematization of the idea generating process, rapid assessment of generated ideas by experts and other participants of the innovation community, that is built around the company;
- turning the ideas coming from the community into innovative projects and possibility of monitoring for its implementation on the same portal by the same experts;
- monitoring of the performance of all participants in each project through the various stages of the innovation process by the portal-based interface;

- the semi-automatization of identifying the best ideas, the best innovators and experts on the basis of the rating methods.

Software platforms that are aimed to implement "an order for innovation" and creation of new competencies generally consist of three major modules:

- A module for generating ideas that is a tool for setting corporation's goals and problems, which can be delivered to the open innovation community, as well as the tool of idea generation for the non-corporate user's intended purposes (if they are also the registered users of the platform and the corporation allows that).
- A module of the evaluation and selection of the ideas, which provides a selection of the best ideas from the database based on their ratings. The module provides an environment for peer review of the best ideas and the subsequent selection of ideas for implementation on the basis of the expert evaluation.
- Modules for training and project management give the tools to describe the concept of an innovative product or service/solution on the basis of the selected ideas, and to manage the project together with partners. The release of this module contains systematically and continuously updated management information on the progress of the project.

Architecture and technology are often the same on different platforms and belong to a large class of "idea management" tools, which are intended to improve the business results.

Gratton (Gratton, 2014) notes that over the past few years, many companies have launched their own platforms of the same kind for the purpose of making a profit by attracting a large number of external participants for generating the ideas and innovative projects. Some firms use independent multicorporate platforms and the important profit of the latter is the common and large expert base.

The platform InnoCentive is one of the first of this kind, which is focused on crowdsourcing. It is designed to organize the process of generating ideas and complex problem solving for day-to-day needs in business, social, scientific, and technical spheres.

Using a unique methodology of InnoCentive each task with the assistance of specialists is evaluated and then divided into smaller sub-tasks, which are assessed and then addressed through the system's interface to the community that has approximately 300,000 people. Those who are interested in challenge and reward for work (which is announced inside the system by the customer) represent their ideas the customer to evaluate their decisions. The customer chooses the winner who picks up his award and gives in turn the right to use the intellectual property if it is created in the initiated project. InnoCentive supports the widest range of tasks: from the generation of business ideas for marketers that promote a particular product to complex technical or scientific problems. Sometimes, according to

the results of that proposed decision the team of the authors receives invitations to work in the customer's corporation, thus forming the new competencies.

NineSigma is one of the largest innovation partners for companies worldwide, contributing to the promotion of the practice of "open innovation" including competencies management. Thanks to its own social network, Grand Challenge program, the rapid growth of the platform was supported. Due to move to new large markets, NineSigma has reached a serious level of development.

NineSigma platform has a whole range of options for business, the purpose of which is to develop innovative solutions to enhance domestic resources and to attract external. NineSigma platform has offices in the United States, Europe, Asia, and Australia. NineSigma network of solvers is one of the biggest in the world and consists of more than 2 million people.

Another popular resource is Yet2.com. Unlike NineSigma and InnoCentive, Yet2.com deals with the exchange of ready-to-introduce technology between companies, universities and government laboratories, and the basic unit of transfer is a package of intellectual property, although the practical results of the transaction can be hiring teams. Members of the network initially communicate with the customer through Yet2.com. Thereafter, the parties shall cooperate directly.

For example, Yet2.com accumulates the descriptions of all the patents, the authorship of which is owned by units of Proctor&Gamble (P&G) and its key partners, and uses this database as the B2B-market for intellectual property. Given that only 10% of 27 000 company-owned patents are used regularly; the remaining 90% in the absence of such a market would constitute a "dead load". By means of this IT-system those patents are actively transferred to the market, if they do not contain any secret information (Bih-Huang and Chu, 2015).

A good example of an internal portal to search new contacts and networking in technology development is the InnovationNet which is also used in P&G. It is a web-portal of P&G internal network for 18,000 innovators of the company engaged in scientific research, engineering development, carrying out marketing activities, procurement and registration of patents. It looks like the "global cafe" for the ideas exchange.

The Wazoku project, which is a platform for idea and innovation management, helps businesses of all sizes to get the best ideas from employees, partners and customers. Mechanisms of Wazoku allow capturing, creating, evaluating, prioritizing and then choosing best ideas and their sources. The basic module of the Wazoku is called IdeaSpotlight. It applies the crowdsourcing technology to gather information, assess it, and then subsequently sort. One of the disadvantages of its crowdsourcing is considered irregular qualification of project participants. And for example, if we are talking about collecting views on the bone marrow transplant, you need specialists in this area, and not just amateurs.

The New Zealand startup HunchBuzz provides a platform for the cloud-based customer and employee interaction. HunchBuzz allows entrepreneurs and businesses to build strategically and manage innovative internal and external ideas network with powerful research tools for feedback and gamification.

A Russian example is the Witology portal, which creates online community with new principles of interaction and extensive capabilities for large-scale collective intellectual work. To date, the productive work involved hundreds of thousands of participants, more than 30 national-scale projects have been already implemented for clients such as the Moscow City Government, "Azbuka Vkusa", Sberbank, Rosatom, Russian Railways, Agency for strategic initiatives and many others. The most famous project within Witology was in financial sector. Sberbank, the leading bank of Russia, which is creating a wide platform for e-banking so it looked for new ideas in field of customer relations with the help of Witology functional.

The capabilities of the considered platforms of open innovation are presented in the Table 1.

Platform Capability	InnoCentive	NineSigma	Yet2.com	Innovation Net	Wazoku	HunchBuzz	Witology
Ideas generation	+	+		+	+	+	+
Expert evaluation of ideas	+	+		+	+		+
Solving complex technical problems	+	+					+
Marketing solutions	+	+		+		+	+
The presence of social networking		+			+		+
Integration with corporate programs	+	+	+	+	+	+	+
Scientific competitions		+					+

Table 1. *The capability of the open innovation platforms*

Now almost all banks across the globe offer online banking with different capabilities and the competition is intense. Online Banking platforms have existed for more than a decade now and offering online banking is now as good as a commodity (Sakkab, 2006). With more and more customers enrolling for online services, the banks are under constant pressure to provide distinctive and unique features catering to niche segments (Mariotto and Verdier, 2015; Raitani and Vyas, 2014). In Russia one of the most influential companies in the area of e-payment is Qiwi, which is listed in the stock market. It possesses the system of gathering innovations, which are then selected to it fund, Qiwi Ventures.

Another influential financial entity in Russia, Alfa-bank, develops a platform of collecting the innovations in banking sector to search a synergy between startups and its own banking platform. So, the question is, what basic parameters should be implemented in the IT system dealing with new competencies formation and innovation search. The System should include the function of interaction with the external environment to heir the teams capable of new competencies generation and development. On the one hand, it should have an information space, which includes information on a wide variety of professionals, teams and tasks. The information put by participants themselves obviously contains a large amount of information "noise" that must be filtered both by the System (in the case of poorly completed forms) and by the supporting team interface. And, on the other hand, the portal should provide the capable teams (including research) with the information about customers' needs and should have the functionality to arrange close technological and commercial interaction between them. If the System is promoted properly it will soon be filled with the vast array of information that can be used for the efficient operations of the company in the search of the sources of new competencies.

The portal should reflect the following information:

- the ordering forms for work, problems, and services;
- the forms to describe the commands and personal cabinets of leaders and team members;
- the competency description forms;
- the R&D description forms (for completed and unfinished R&D), including the description of the patents, and other IP objects.

The portal should support the involvement of a large number of participants including professionals from the company, universities, research institutes and other structures, as well as from the private sector. The system should provide the ability to professionals, experts, and other interested people and structures to serve as active participants in the development and establishment of various ideas and have functional collaboration to implement the customer's tasks.

The portal introduction shows significant positive practical effects for a company.

- Improving the transparency and openness for new ideas coming from internal and external experts and even customers will increase speed of corporate's development.
- The company's development of small and medium-sized projects, including those of breakthrough nature will increase of investment attractiveness of the whole firm.
- Creating the demand for services and technologies, improving the competitiveness of a company, will become the solution of certain marketing problems.

Within the framework of the portal it is possible to seriously improve the organization of technology transfer, "custom for innovations", purchasing and selling the objects of intellectual property (patents,

licences, etc.). The section of intellectual property trade within the portal should be organized in the online forms through which intellectual property owners (including holdings) will be able to declare on their sites (according to properly made guidelines). Potential buyers should be able to gain access to information that enables them to order specific objects of intellectual property, and even create an application on the portal to the conclusion of a juridical firm agreement.

The portal should have a function to search for specialists and teams from a number of external participants to integrate them in the firm.

To attract talented employees in the company that would become part of a competitive team, a company should follow some best practices carrying out each recruitment procedure.

- Clearly specify in the portal the aims and goals which are required from the new team, what qualities should they possess and what qualities/skills, which the company is ready to teach them.
- Prescribe, what will be the training program, which starts after the staff/team is hired.
- Briefly describe the system of motivation and benefits associated with the result. Gains of the team should be associated with the effective work for the company. The Portal term can be equipped with an automatic system of compensation size depending on the number and impact of implemented projects.
- Reflect on the portal the personal characteristics of the members such that career development, training. Based on these data, the company could improve a cycle of development of the staff and external teams, establish a system of trainings aimed at achieving the corporate goals.

Using the mechanism described above it is important to focus not on the number of involved discussion of interested individuals (business representatives, scientists, students, etc.) but on the quality of the ideas of active participants in the process of generating proposals and hiring personal and outsourcers in the Portal. Due to low physical and financial cost, the mechanisms described above should be considered as efficient and recommended for implementations.

CONCLUSIONS

In modern conditions it is extremely important to actualize in industrial companies the competencies management mechanisms and tools for this task.

In this paper the analysis of the most popular platforms of open innovations is carried out. There is considered the functioning features of such platforms, as InnoCentive, NineSigma, Yet2.com, InnovationNet, Wazoku, HunchBuzz, Witology. Such mechanism of open innovation allows companies

to make a profit and develop the competencies by attracting a large number of external participants which can generate the ideas and innovative projects.

The results of the analysis of the best practices in the field of competencies management can be carried forward in the development of the conceptual bases of the corporate portal creation to manage innovation and competencies with a view to applying the most effective mechanisms to form and control the unique competencies and competitiveness.

THE EFFECT OF TECHNOLOGY IN THE CREATION OF PERSONAL BRANDING AND ITS IMPACT ON PROFESSIONAL PROGRESS

Shyle, Irma¹; Azizi, Romina²

¹Department of Production and Management, Polytechnic University of Tirana (UPT), Tirana, Albania

²Faculty of Mechanical Engineering, Polytechnic University of Tirana (UPT), Tirana, Albania

ABSTRACT

The evolution of technology has influenced the emergence and development of new forms of promotion. Through its influence, technology greatly influenced the spread of online marketing. The great impact of technology was found in the success of creating personal branding. The personal branding phenomenon was considered as the most sophisticated way for self-promotion and for the promotion of products and services offered for profit by individuals and companies.

The purpose of this paper is to verify the link existing between elements: technology - personal branding -professional progress.

The questionnaire was built in four sections, to collect general information on demographic data of study participants, to verify by questioning the individual's and / or entrepreneurial relationship with personal branding, the effect of technology on creating personal branding, and the last section focused on linking personal branding to professional progress. The correlation analysis it is used to verify the validity of hypotheses, the importance of the econometric models and the importance of the coefficients in the model.

Results indicate that technology has a significant effect on creating personal branding as well as in spreading personal branding through online platforms. Using technology equipment and various online platforms are the main source of addiction to individuals. The role of personal branding in the impact of professional progress is as significant as the role of technology in its creation. Combining personal skills with the influence of personal branding is crucial to professional success.

Keywords: personal branding, technology, social media, online platform, professional progress

INTRODUCTION

The effect of technology in creating personal branding is very important, the success of this phenomenon came through the spread in social media. Social media was rated as the most successful way of spreading the personal brand in the era of globalization. The impact of Facebook, Twitter and other online media was so great that these platforms turned into the key form of online marketing.

Though it positively influenced the personal branding success, intensive use of technology did not have the same effect on personal brand users. The dependence on technological devices and social media was associated with the emergence of psycho - social difficulties of individual users. On the other hand, creating personal branding and promoting it in social media was praised by many as a way of success for self-marketing. In social network profiles, many users found the right way to promote themselves as a result of personal brand success.

The personal promotion binomial associated with the success of personal branding had an impact especially on the professional progress of the individual. In this way, technology had a great impact on creating personal branding and the importance of personal branding in professional progress was appreciated.

LITERATURE REVIEW

Personal branding

About the end of the 1990s, a movement based on the transformation of ideas into different fields of the economy was born in the corporations. The massive spread of these movements meant the beginnings of a new phenomenon at that time, which was not concretized with a theoretical denomination until that moment.

In 1997, Tom Peters through an article titled "The brand called you", published in the Fast Company magazine explained that the 1990s movement was the birth of a new phenomenon which he named as personal branding.

Personal branding is a combination of personal skills, personal interaction with others, lifestyle and personal achievements. The guarantee of individual success and personal reputation are a derivative of personal branding success. Given personal views about the personal branding phenomenon and referring to the research conducted, different scholars determine different ways to build personal branding patterns. The original model conceived by Peters (1999) emphasized that successful professional presentation had the basis in personal assessment. The next model of McNally and Speak (2003) focused on the sustainable development of personal branding resulting from differentiation and authenticity that together form the brand's dimensions.

Among the most sophisticated models built for personal branding was Ortega's model (2008) based on three essential factors: "A - analysis, attributes, authenticity; D - differentiation; F - Fame "defined as the ADF model. Contributions provided by various authors from the beginning to the present have brought the continuous progress of personal branding.

Personal branding from different authors was described as: managing an extended self (Belk 2013); planned process in which people make efforts to market themselves (Khedher 2014); the deployment of individuals' identity narratives for career and employment purposes (Brooks and Anumudu 2016).

The impact of technology in the creation of personal branding.

The technology revolution extends into two important periods, where the first period marks the birth of the beginnings of the technological revolution and the birth of Web 2.0. While the second period was named by the term "social media online" that marked the revolution of technology. During this period, was identified the emergence of some personal and interpersonal phenomena in social media, among them was the creation of personal branding.

The first step: Web 2.0.-is a revolution in the field of social communication (Cobo and Pardo, 2007, Kaplan and Haenlein, 2010,) which was widely promoted and spread thanks to various applications. Web 2.0 influenced the way users communicate technology and facilitating collaboration between different groups. In this way, Web 2.0 was not just a technological evolution but also an evolution of social relationships. Schau, H. J. & Gilly, M.C. (2003) in their research find that the reasons consumers self-present in personal Web space are similar to the reasons that they self-present off-line in many respects.

The second step: Social media-are the most sophisticated way of communication channels. With their help, any individual who has access to the Internet interacts, collaborates and distributes content in order to create social, personal or business relationships. The effect of social media on personal creation is extremely important.

Social media provide opportunities not only in creation but also in the confirmation, progress and continuity of personal branding success. There are a number of ways that guarantee the successful performance of personal branding in various social media platforms. Ways that necessarily relate in a conditional form with the creator and / or the personality of personal branding. Personal branding created in social media is related to the personal and professional attributes of his creator. According to Aaker (1997) the personality of personal branding is intertwined with the human personality. Unlike Aaker's (1997) assertion, Keller (2006) found that personal branding personality is an expression of the brand's own personality rather than the creator, and meant that a brand could be branded without affecting the creator's personality. One of the latest researches based on the identity of personal branding in social media emphasizes the extended identity of personal branding. Favorable impression in the online platform among the target audience can fulfill self-esteem need of individual both in online and offline environment, which consequence is a successful personal branding (Shaker, F. & Hafiz, R. (2014).

The extended identity of personal branding is viewed as complementing the initial identity features. The act of personal branding seems to be best performed in a subtle and authentic way (Brems, C. at al 2016). The brand's fate is more dependent on its extended identity (Bendisch at al. 2007). Developing friendly relations with other related specific brands achieves a leveraging effect to promote the branded-selves (Liu, R. & Suh, A. (2017). There is a widespread consensus that the key driver for personal branding is the ease of access to technology, especially the Web 2.0 tools, such as social media and blogs (Harris and Rae, 2011; Holton and Molyneux, 2017). Regarding the impact of technology on the life of the individual and mainly in his daily life and also the effect of technology on creating personal branding will be verified by the main hypothesis and the alternative hypothesis which are:

H1: Technology has impact in the life of the individual/user and

H2: Technology has a huge impact in the creation of personal branding

The impact of personal branding in professional progress

The creator of personal branding can benefit in different ways from the success of his achievement. One of the most efficient forms is to utilize the success of personal branding in favor of professional progress. According to Goffman (1959), every individual can influence the perception that others create around us. Auto-presentation on different platforms of social media is one of the most essential ways in the continuation of professional progress. The concept of personal branding is self-presentation (Goffman, 1959).

Another influential element is self-expression. Expressing an individual to online audiences about personal and professional abilities influences the creation of online identity and perception of others. Consequence of self - expression is another personal activity: self - promotion. Through self-promotion, the creator of personal branding introduces itself to entrepreneurs successfully. Personal branding in social media is the process of taking control of the impressions one is making in the virtual world (Schau & Gilly, 2003). Building one's personal brand is a continual process (Johnson, M. K. 2017).

But why is it so important to use personal branding in professional progress? Brand teaches an individual how to be more strategic by staying connected with the market (Kaputa, 2005). In this way, personal branding realizes the link between the individual and the enterprise operating under the broad market. According to Schawbel (2019a), when the customer associates the branded product with the mark, then positive thinking goes to entrepreneurship. The success of personal branding can thus be oriented from the success of entrepreneurship. Today people who do not develop themselves are left behind and have significantly smaller chances for professional success (Figurska. I 2016).

As a result, successful personal branding can be influential in any venture to realize professional collaboration with its creator. The personal brand is not about our job title, it is about the difference we bring through what we do about the power to convince that we do it well, sustained by the received feedbacks (Petruca. I 2016). To verify the link between personal branding created on online platforms and its impact on professional development, the main hypothesis is:

H3: Personal branding is very important in professional progress

METHODOLOGY

To prove the link between technology - personal branding and professional progress, the first stage of the process was the selection of the type of investigation. After analyzing the types of investigations, it was determined that would be applied, the descriptive and correlational type of investigation. By means of descriptive examination, the characteristics, links and profiles of the individuals participating in the process will be specified. Through correlative analyses, it is required to establish the correlation between variables of different situations.

The questionnaire was used as a methodological tool for conducting the investigation, the form of which was based and interlocked on open, closed questions. The questionnaire was built in four sections where the first section of the questionnaire sought to collect general information on demographic data of study participants. Other sections sought to verify by questioning the individual's and / or entrepreneurial relationship with personal branding, the effect of technology on creating personal branding, and the last section focused on linking personal branding to professional progress. The questionnaire was built in a survey type.

The third stage consisted in determining the population and the sample. More specifically, ventures were selected as part of the population, while the staff of marketing departments and human resources of entrepreneurs was identified as a sample.

It was consistently carried out in a finite number of individuals selected as part of the pilot study sample. The purpose of his application was to verify uncertainties about questions and final fix before functionality.

The last phase of the methodological process consisted of data collection which in this case referred to the responses expressed by the individuals participating in the questionnaire.

Analyses that will serve to produce the results and the final conclusion are descriptive and correlative analysis. Descriptive analysis or data analysis refers to the aggregate of information accumulated by questionnaires on demographic data, personal online branding, the link between personal branding and technology, and personal branding with career development. While through the correlation

analysis it is required to verify the validity of the formulated hypotheses and the importance of the econometric models together with the importance of the coefficients participating in the model.

DATA ANALYSIS

At this stage, the descriptive analysis of each section of the questionnaire was conducted. Referring to the descriptive analysis of the section "Demographic Data" it was ascertained that:

- 56.7% women and 43.3% males
- The largest part of respondents belonged to the age group of 25-35 with a share of 51.3% followed by 30.9% from the group age of 36-45. The 46-55 group age occupies a 15.7% share of respondents, followed by 1.3% of the 56-65 group age. The smallest percentage of respondents belongs to the age group over 66 who is only 0.8%;
- 30.3 % of participants was graduated in university and 69.7% had finished undergraduate studies.

The second section of the questionnaire addresses the "Personal Branding Phenomenon" where closed questions were asked for participants to declare whether or not they were creative to a personal branding. From the data analysis it was found that 34.6% of the respondents stated that they own a personal brand and 65.4% of them claimed that they are not creators / users of any brand. Participants who declared themselves creative / personal brand users claimed that the most widely used online platforms include: Instagram 31.2%, Facebook 23.4% and Personal Blog 9.7%. At lower values were ranked platforms like You Tube, Website, LinkedIn, Pinterest, and Google+ account.

The impact of technology is very present in each individual's life. In this session of the questionnaire in two subdivisions are addressed the effects that the use of technology has in individuals and the effects of technology in creating & the success of personal branding.

The effect of technology on the individual. Through selected situations, it is required to assess the degree of impact of technology on individuals' lives and the effects of the use / non-use of technology. Participants in the questionnaire were asked to evaluate the frequency of repetition for each of the situations according to the assessment grades 1 – not at all, 2 - little, 3 - on average, 4 – very much, 5 - extremely very much.

From the final results it is ascertained that:

- The use of mobile phone during everyday life is very frequent at 40.2%;
- About 30.7 % of respondents claim that they often check the mobile phone;
- Regarding to other technological equipments, about 22.4 % claim that their use during the day is low;
- While the use of Internet is large to respondents to an extent of approximately 39.5%;

Referring to the time spent, the appearance of anxiety and nervousness by the non-use of these devices and the feeling of being dependent on the use of technological equipment, the respondents state that they are not at all affected by these phenomena, respectively 35.4%, 36.9%, 44.7%.

Table 1: The effect of technology on individuals

	1	2	3	4	5
1. Use of mobile phone	0.5	9	27.3	40.2	22.7
2. Addapt to technological innovations	20.6	24.3	26.9	18	10.2
3. Checking the mobile phone	5.9	18.2	25.7	30.7	19.5
4. The use of technological equipments	22.4	21.7	19.4	17.9	17.6
5. Surfing the Internet	0.6	11	25.4	39.5	23.5
6. Online problem solving	20.7	21.9	24.7	17.2	15.5
7. Online chating with friends or others	3.9	15.6	19.4	35.7	25.4
8. Spend very much time on internet	35.4	29.5	26.1	5.5	3.5
9. I'm nervous when I don't use the phone/Internet	36.9	33.5	19.4	9.3	0.9
10. I'm very addicted in using these devices	44.7	38.1	16.2	0.8	0.2

Source: Author's original finding from research

The impact of technology in the personal branding creation.

According to Schau, H. J. & Gilly, M.C. (2003), the reasons consumers self-present in personal Web space are similar to the reasons that they self-present off-line in many respects. The same results was find in our study. Participants were asked to evaluate the impact that technology has on:

- Gaining Fame - 30.5% of respondents say that technology has a tremendous impact on gaining the fame of the personal branding creator and only 16.6% say it has no impact at all.
- Identifying personal branding creators to their audiences as the only solution to personal problems - 25.2% of participants (the majority) said that technology has little impact while the minority around 15.3% think it has an extraordinary effect;

- Creating online identity - 32.4% of respondents think that technology has little impact on personal identity creation versus 6% of participants, which is the smallest measure that approve for this fact.
- Achievement of goals - Much of the participants estimates mean that technology has an average impact on achieving the creator's goals of personal branding, namely 35.7%.
- Strengthening self-esteem at the personal branding creator - 27.4% estimate that technology has a lot of impact on strengthening self-esteem of the personal brand creator.

Graph 2: The effect of technology on personal branding

Source: Author's original finding from research

Another question that was posed to participants in the questionnaire was related to the direct impact that technology has on creating, affirming, persisting, optimizing and aiming for personal branding. It was found that around 25.2% of participants thought that technology has an average impact on creating personal branding, while in affirming personal branding its effect/impact is enormous. Concretely this opinion is 33.6% of the participants. Regarding the technology's impact on continuity and achieving the goal of personal branding, most of the participants around 34.5% are of the opinion that its effect is enormous. The opinion is opposite about the impact of technology on optimizing personal branding.

Graph 3: The effect of technology on personal branding

Source: Author's original finding from research

Referring to the impact of social media on the spread of personal branding about 36.5% of participants in the questionnaire are of the opinion that online platforms have a tremendous impact on the proliferation of personal branding. While the blog, the self-satisfied community (Instagram and YouTube users) and multiplayer online games greatly affect the spread of personal branding. Specifically, the impact of the blog is 23.7%, of the complacent community about 30.7% and of online multiplayer games by approximately 28%.

Online microblogging platforms (Twitter's main representative) according to respondents have an impact on the spread of technology on average.

About 25.9% and 27.5% think that wikis and interpersonal and / or chats have little impact on personal branding, while podcasts and hybrid applications do not affect the penetration of personal branding by 30.7% and 29.9% of respondents.

Table 2: Impact of online platforms on the spread of personal branding

	1-not at all	2 –little	3 –on average	4 –very much	5 - extremely very much
Blogs	17.2	18	21.5	23.7	19.6
The self-satisfied community	9.4	10.3	20.2	30.7	29.4
Micro-blog	19.9	15.9	24.7	20.2	17.3
Wiki	23.7	25.9	20.4	19.2	11
Interpersonal	20.3	27.5	19.7	16.3	16.2
Podcast	30.7	29.4	20.2	10.3	9.4
Hybrid applications	29.9	22.3	19.9	15.3	12.6
Multiplayer online games	12.7	14.7	25.3	27.6	19.7

Source: Author's original finding from research

Participants in the questionnaire were asked to evaluate the impact that personal branding has on them. Personal branding creators expressed their opinion on the impact that personal branding has on brand transformation, ongoing exposure to online platforms, online addiction, increased personal engagement and professional progress.

According to about 30.5% of participants, the impact that personal branding has in brand transformation is extremely large. While, according to them, having a personal brand has on average an impact on the owner's continued exposure to online platforms. This opinion is 27.4% of participants.

Constant exposure to online platforms can become a cause for creating addiction to them. Of this opinion, are about 35.7% of respondents who say that the dependence on online platforms comes from constant network exposure.

According to Figurska. I 2016, people who do not develop themselves are left behind and have significantly smaller chances for professional success.

In our study, about the impact of personal branding on increasing professional engagement and professional progress, approximately 34% and 25% of respondents say that the impact of personal branding on these elements is moderate.

Graph 4: The impact of personal branding on personal and professional elements

Source: Author's original finding from research

Participants in the questionnaire expressed their opinion on the impact of various elements on personal branding. They appreciated elements such as creativity, variety of component elements, audience fidelity, image and positioning on platforma.

The people asked say that the elements that have an enormous impact on the success of personal branding are the image and loyalty of the audience. This opinion is respectively 35.7% and 38.2% of participants corresponding to the majority of opinions.

Regarding the impact of creativity and networking on the success of personal branding, the individuals asked are of the opinion that these factors have a great impact on the success of personal branding. 30.7% of respondents are of the opinion that creativity has a great impact on the success of personal branding and 25.5% are pro-rated in the correct positioning of networks. According to them, the variety of branded components is the factor that has less impact on the success of personal branding.

For the construction of the econometric model, the features included in the model are considered personal branding features, technology features, professional development features, technology effect, and personal branding. These features have served as variables depending on the regression model that is built.

To verify the accuracy of the built models, the process of their evaluation and the process of verification of importance will be realized. Once the hypotheses are formulated about the importance of the model, the F - statistic value in relation to the F - criterion value will be analyzed. Based on the

results it is ascertained that for each model, the value of F - statistic is greater than the value of F - critical meaning that the model or patterns are important.

Another test that is carried out in the econometric analysis is the verification of the importance of the coefficients. For the concrete study it is taken into consideration that their testing is carried out with the help of the T - statistic test. Even in this case, to verify the importance of the coefficients, the value of the T - statistic should be greater than the critical value of the T - statistic test. Once the hypotheses are formulated on the importance of the coefficients, the respective T - statistic values are analyzed. The values result to be greater than the T - critics that would imply the importance of the coefficients.

Model built for the effect of technology on individuals. The regression model created for assessing the effect of technology on individuals corresponds to the third part of the questionnaire. In this case, therefore, the construction of the regression model from the effect of technology on individuals was taken as variable X: the characteristics of individuals (which are explained in the descriptive analysis) and as Y: the effect of the technology. The model that expresses the link between technology and individuals is:

$$Y = - 37.9 + 14.8 * X$$

Where, if we consider the influence of the X variable that expresses the use of technology by the individual as negligible, then the effect of the technology would be (37.9). But despite the coefficient interpretations, we must emphasize that the use of technology is associated with multiple effects on individuals. Such a fact can be justified by the uncertainty R2 coefficient which in this case is very close to 1 which indicates that this regression best explains the data.

The regression model built for the effect of technology on personal branding. The regression model built for the effect of technology on personal branding corresponds to part C2 of the questionnaire. Through the data processed by the questionnaires, more specifically of this part will be built regression model for the effect of technology in the creation of personal branding. For constructing the model of this part of the questionnaire will be used as variable X: personal branding features and Y: the effect of technology in creating personal branding. The model for this case is:

$$Y = 4.4 + 0.01 * X$$

Reasoning in the same way as in the regression built for the above case, we can easily appreciate the effect that technology has on creating personal branding.

The regression model built for the effect of personal branding in professional progress. The regression model built for the effect of personal branding on professional progress refers to the last part of the questionnaire, specifically to point D. The regression model built for the personal branding effect on professional progress has as the X variable: the personal branding characteristics evaluated by

participants in the questionnaire through the assessment scales and as Y: career progression. The regression model for this case is:

$$Y = - 37.6 + 4.18 * X$$

With the help of econometric analysis and in this case, we can confirm the relationship that exists between the personal branding variables and its effect on the professional progress. Through the values of the uncertainty coefficient we can point out that this regression best describes the data.

Realizing the testing of the significance of the models and coefficients through the F - Statistic and T - Statistic tests results that both the formatted models and the coefficients are important.

CONCLUSIONS AND RECOMMENDATIONS

This study was focused on realizing a detailed theoretical analysis of the importance and impact of technology in creating personal branding. Also, through theoretical analysis, the impact of personal branding on professional progress was assessed. At a second stage, empirical analysis was applied on the importance of technology in creating personal branding as well as on the role of personal branding in professional progress.

From the realization of the econometric analysis some of the conclusions that we conclude are:

- Technology has a significant effect on creating personal branding as well as in spreading personal branding through online platforms. The success of mass spread depends on online audiences. Such a conclusion was reached through a detailed econometric analysis that established the link between technology and personal branding.
- The continued use of technology equipment and various online platforms are the main source of addiction to individuals. This conclusion was mainly formulated through descriptive analysis carried out in the first part of the study.
- The role of personal branding in the impact of professional progress is as significant as the role of technology in its creation. Combining personal skills with the influence of personal branding is crucial to professional success.

Based on the conclusions reached, we can say that the alleged connection presented in the introduction of the work is verified. So, there is the link between the effects of technology on creating personal branding which through success can affect the professional progress of its creator.

Referring to the conclusions reached from the implementation of the descriptive and econometric analysis we can recommend that:

- The use of technology, mainly of technological equipment and the Internet, is turning into the main cause of addiction. Reducing residence time and their limited use would necessarily influence the prevention of personal addiction.

- Great promotion with the help of personal profiles on various online platforms can negatively impact the emergence of psycho-social difficulties. Even in this case, it is considered reasonable to avoid the massive use of online platforms and their use in favor of achieving personal and professional goals.
- As proven with the help of econometric analysis, the effect of technology is too great in creating personal branding. It is therefore more than reasonable to recommend the use of technology in the spread, promotion and success of personal branding.
- Finally, the role of personal branding in professional influence can be assessed. A success of your brand would undoubtedly affect your professional progress. It is therefore recommended to create a special link between these components that will later result in a double success for you.

Personal branding is a new and complex concept. The study is only a basis for further considerations. The limitations of this study resulting from the relatively small number of respondents and not existing of one model for personal brand study. Although, the results are important information about the effect of technology in creating personal branding and its impact of professional progress that can indicate the future researches.

GENDER DIFFERENCES IN EXPERIENTIAL VALUES COMPONENTS IN AN ONLINE BOOKING CONDITION: INSIGHTS FROM GENERATION

Z

Stavrianea, Aikaterini¹; Kamenidou, Irene²; Bara, Evangelia-Zoi²

¹Department of Communication and Media Studies, National & Kapodistrian University, Greece

²Department of Management Science and Technology, School of Business and Economics, International Hellenic University, Greece

ABSTRACT

Today experiential value in purchasing conditions is considered a prerequisite for customer satisfaction and patronage, especially in the services sector. This paper presents a research study whose aim is to investigate whether gender differences exist as concerns with respect to experiential values from online accommodation booking. For the aim of this study, a field research (N=970) was carried out with individuals belonging to the Generation Z cohort. Factor analysis confirmed the four components of experiential values, and through t-tests we examined the existence of gender differences, revealing differences in two out of four components of experiential values. Marketing suggestions regarding online booking platforms are offered based on the results of the study.

Keywords: Experiential Values, Generation Z Cohort, Gender Differences, Tourism, Online Booking, Marketing

INTRODUCTION

Previous research (see Li *et al.*, 2017; Papathanassis, 2017; Buhalis, 2003; Buhalis, 1998) attests the impact of technology on the tourism industry, with Hallikainen *et al.* (2018) supporting that every facet of economic business operation has been affected by technological advances due to digital channel adoption in the retail environment.

The intense competition observed in the tourism sector and its focus in an attempt to ultimately decrease costs deriving from services (Vasko & Abraham, 2015) has led the travel and tourism field to have been greatly influenced by technology itself (Kyriakou *et al.*, 2015). Another factor that has played a crucial role in technology adoption by businesses is the diffusion and consumer adoption of new technologies for purchasing purposes (Vendrell-Herrero *et al.*, 2017; Vaško and Abrhám, 2015).

The changes that the digital era and its advanced tools put forward have tremendously impacted the tourism sector, augmenting competition among its key players, and offering new opportunities and

incentives. To be more precise, within the contemporary tourism setting, it is mainly information and resources found online that guide and assist travel planners (Zins, 2007) through web-based booking platforms. These, web-based booking platforms have proved to be particularly popular for prospective tourists (Turban et al., 2008), providing them with a user-friendly and unobstructed medium in making their travel arrangements (Ristova and Maglovski, 2018).

Digital transformation is regarded as the fourth industrial revolution (Lee *et al.*, 2014), comprising of two key dimensions: the digital technologies and the user/consumer experience (Henriette *et al.*, 2016). The last-mentioned construct entails multiple number of dimensions that also consist of experiential components; this concept emerges fundamentally from the interrelation that holds between the consumer and the “object” under examination (Gentile *et al.*, 2007), generating customer added value (Holbrook, 2006). Customer value has been defined by scholars in various ways, with Holbrook (1994) presenting it as “an interactive relativistic preference experience” (p. 27); within this process, where “interactive relativistic” desires mold the core aspects of a given consumption experience (Holbrook, 2006).

In general, individuals’ behavior and tourism- related issues have been already studied extensively, with a great deal of studies concerning the embodiment of technology in the tourism industry (e.g. Pierdicca *et al.*, 2019; Martínez-Ros and Orfila-Sintes, 2009; Buhalis, 1998). While studying the relevant literature, one may encounter a considerable number of past studies emphasizing the interrelation of tourism industry and costumers’ behavior; yet, it is very rare to come across scholarly work that combine the parameters: consumer experiential values and web-based booking in a highly digital era. A critical literature examination of these two aspects yields only a limited number of papers devoted to this combination of factors (see, for instance, Abdullah *et al.*, 2016; Choi, 2015).

As regards gender differences in terms of experiential values during online purchasing, very few studies exist (Hasan, 2010; Andrews *et al.*, 2007); similarly, no prior published article has been identified by the authors of the current research regarding gender differences from experiential values.

It is within this framework that the current work aspires to address gender differences as these are reflected in experiential values related to online accommodation search and booking via web-based platforms, with the focus being placed on the practices and consumer behavior of adults aged 18-23 years old (namely, the Gen Z members). Having been raised in a fully digitalized setting, always having internet and laptops or tablets at their disposal, these individuals are extremely well familiarized with technology and its outcomes (Turner, 2015). As a result, the authors’ fundamental aim in the present study is to satisfactorily address the gaps in the literature presented below, which they have been previously identified:

1. Following Williams and Page (2011), the population sample to be studied in this research comprises consumers who are members of the Greek Gen Z cohort that is people born between 1995–2009. As already highlighted, this generational cohort has been neglected from a tourism-sector perspective and as such, it allows considerable room for future investigation.
2. It focuses on gender differences from an experiential values' approach while conducting online accommodation booking, which has not been studied as to the authors' knowledge.

LITERATURE REVIEW

Value has been considered by scholars for a long time a key element in their examination of consumers' evaluation of services, especially in the area of tourism (Kavoura and Stavrianea, 2016; Tsai and Wang, 2016). Consumers regard value as an outcome from the provision of the service (Hollbrook, 1986; Tsai and Wang, 2016). Without any doubt, service providers who can create value for their consumers can successfully survive in a competitive market.

More recently, the gravity of consumer experience and experiential value has attracted increasing attention in the tourism sector (Pine and Gilmore, 1999; Wu and Liang, 2009; Kim, 2014; Tsai and Wang, 2016). Experiential value is primarily associated with the pleasurable experiences that consumers get through the consumption of a product or service which has additional experiential benefits (Shobeiri *et al.*, 2018). Therefore, brands can better serve the modern consumer needs by offering superior value and experiences (Brakus *et al.*, 2009; Kavoura and Stavrianea, 2016; Shobeiri *et al.*, 2018).

Hollbrook (1994) proposed two dimensions of experiential values. The first dimension consists of the intrinsic versus the extrinsic values of the experience, while the second dimension relates to the active versus reactive sources of a value. The intrinsic value of the experience is based on the feelings that originate from the consumption experience. On the other hand, the extrinsic value of the experience is clearly associated with the utility of the transaction (Mano and Oliver, 1993; Hollbrook, 1994; Tsai and Wang, 2016). The second dimension that Hollbrook initiated is the activity dimension (Hollbrook, 1994; Hanif *et al.*, 2017) where active value refers to the consumer's participation and collaboration with the provider, whereas reactive value is linked to the comprehension and appreciation of the consumption experience (Hollbrook, 1994; Hanif *et al.*, 2017).

Aligned with Hollbrook's two axes, Mathwick *et al.* (2001), proposed four dimensions of experiential value (Tsai and Wang, 2016). According to Mathwick *et al.* (2001), the four dimensions of experiential value include aesthetics, playfulness, service excellence and consumer return on investment. Aesthetics refers to the visual and entertainment appeal of the service performance, such as the design and format, as well as graphics, photography, color, and physical attraction (Mathwick *et al.*, 2001;

Tsai and Wang, 2016). Playfulness is related to the intrinsic joy the consumer receives from the engagement with experiences that may act as a getaway from the everyday obligations and routine (Mathwick *et al.*, 2001). Service excellence relates stems from consumer's evaluation of the quality and expertise that was provided (Mathwick *et al.*, 2001) and encompasses both extrinsic and intrinsic value elements (Mathwick *et al.*, 2001; Tsai and Wang, 2016).

Finally, customer return on investment is associated with the utility, the return that the consumer receives from any given experience, with the encounter being related to the consumer's financial, behavioral, temporal and psychological investment (Mathwick *et al.*, 2001; Tsai and Wang, 2016).

Previous research has proven that experiential values could positively affect customer satisfaction (Lee and Overby, 2004), involvement (Shobeiri *et al.*, 2014), and loyalty intentions (Mathwick *et al.*, 2001; Jeong *et al.*, 2009; Brakus *et al.*, 2009; Choi, 2015; Shobeiri, 2018). However, as mentioned above, limited scholarly work has studied experiential values and web-based booking (Abdullah *et al.*, 2016; Choi, 2015).

Gender differences

Experiential value positively impacts consumers' perceived benefits and behaviors (Schmitt, 1999; Shobeiri, 2018). Female and male consumers, though, perceive in distinct manners the stimuli in this benefit cognition process (Liang *et al.*, 2013). Males and females handle information in a different way when facing cognitive problems which can lead to different purchasing behaviors (Chang, 2007; Liang *et al.*, 2013) due to the different behavior objectives (Elliot, 1993; Liang *et al.*, 2013). For example, men may seem to focus more on establishing a more powerful image whereas females are more sensitive towards the 'sensory stimuli' and experience (Liang *et al.*, 2013).

Prior research on gender differences among users of the Internet supports that females and males hold different perceptions, attitudes and behaviors (Chen and Macredie, 2010). Weiser (2000) argued that there are differences between genders with respect to Internet users as, more specifically, males use it more for entertainment while females use it mostly for communicating with others and looking for information. Veltri *et al.* (2012) supported that there are similarities as well as differences between female and male online gaming users, while Zhou *et al.* (2011) supported that there are gender differences between users of virtual word sites, as females tend to use them more for purchasing and researching, contrary to men who care more about using them for profit making. Similarly, Choi *et al.* (2012) found that females seek more than males for information in virtual environments; on the other hand, Hassouneh and Brengman (2014) supported that females are more motivated by escapism. Nevertheless, Islam and Rahman (2017) found that no differences can be attested across genders in terms of online brand communities' characteristics. The findings mentioned above lead to the indication that genders may perceive differently experiential value dimensions.

As far as gender differences in terms of experiential values during online purchasing are concerned, very few studies exist (Hasan, 2010; Andrews *et al.*, 2007). It is along these lines that this paper suggests that there are gender differences in terms of experiential values dimensions towards the e-booking, with our research hypotheses being cited below:

H1: There are differences between genders in terms of the aesthetics dimension of experiential value of the e-booking platform.

H2: There are differences between genders as far as the playfulness dimension of experiential value of the e-booking platform is concerned.

H3: There are differences between genders in the service excellence dimension of experiential value of the e-booking platform.

H4: There are differences between genders with respect to the return on investment dimension of experiential value of the e-booking platform.

METHODOLOGY

The current study was performed on three stages. In the first axon an in-depth literature review on experiential values, online booking and the Generation Z (Gen Z) cohort took place, together with the formulation of the survey questionnaire. The questionnaire for this study was adopted from a study conducted by Shobeiri *et al.* (2018) on experiential values (components of aesthetics, playfulness, customer return on investment, and service excellence) and online shopping (where items were rated on a 7-point Likert scale). On the second axon, a pilot-test of the questionnaire was conducted to guarantee functionality and face validity (Kent, 1993) via 135 university students who provided real-time feedback following their participation. Lastly, in the third stage, the field research was implemented with the internet as its distribution channel. A non-probability sampling method that combined criteria, convenience, and snowball sampling was utilized. The criterion for subjects' participating was that respondents should belong to the Greek Gen Z cohort. Researchers invited their students and friends to visit the Facebook page (i.e. the account opened specifically for this purpose), and to answer the questionnaire provided through the corresponding link; participants were also encouraged to forward the link to people they know that were also members of the Greek Gen Z cohort. By this manner, a total of 970 questionnaires appropriate for analysis were collected. The subsequent analysis included: descriptive statistics, reliability, factor analysis and t-tests.

RESULTS

Test of Reliability and Confirmatory Factor Analysis

A second-order confirmatory factor analysis (CFA) was performed at first, demonstrating a good fit for the experiential values scale and all items exhibited acceptable loadings ($\chi^2 = 32.848$; $p < .001$; AGFI = .919; TLI = .951; CFI = .983). The components of the experiential scale were also tested for internal consistency (reliability, convergent and discriminant validity). Cronbach's alpha in all cases was $> .80$ (Aesthetics: $\alpha = 0.90$; Playfulness: $\alpha = 0.92$; Customer Return on Investment: $\alpha = 0.90$; and Service Excellence: $\alpha = 0.82$), indicating adequate internal consistency reliability (Nunnally, 1978). Additionally, convergent validity was tested by calculating the Average Variance Extracted (AVE) for every factor (Table 1), which should be above the threshold of 0.5. The results of the analysis indicated that AVE for all factors is above .70 (AVE $> .70$), thus, confirming established convergent validity (Fornell and Larcker, 1981). Discriminant validity was examined by comparing the square root of AVE of each factor (Table 1) with the correlations of the factor with all other factors (Fornell and Larcker, 1981). In Table 1, the Square root of AVE is on diagonal (Bold), and the correlations among factors are off-diagonal.

Parameter	AVE	Aesthetics	Playfulness	Customer Return of Investment	Service Excellence
Aesthetics	0.72	0.85			
Playfulness	0.71	0.61	0.84		
Customer Return of Investment	0.76	0.59	0.54	0.87	
Service Excellence	0.85	0.63	0.65	0.69	0.92

Table 1; *Convergent and discriminant validity tests*

Components of experiential values

Table 2 presents percentages and mean scores (MS) from the components of experiential values as regards the Gen Z cohort. The results reveal that the Gen Z cohort is more favourable towards the *Aesthetics* of the online booking platform that they use, compared to any other component consisting of experiential values. As to the *Aesthetics* component of experiential values, three out of five items have MS > 5.00 , revealing that the Gen Z cohort agrees to some extent to these statements. As regards the components *Playfulness* and *Service excellence*, no item was rated with a MS > 5.00 , while in terms of the component *Customers Return on Investment*, one item was rated with MS > 5.00 . Lastly, it should be pointed out that the items with the lowest MS are linked to the *Playfulness* component of experiential value.

Components/ statements	1 (%)	2 (%)	3 (%)	4 (%)	5 (%)	6 (%)	7 (%)	MS
Aesthetics								
The way the online booking platform displays its products is attractive	4.0	5.1	4.2	13.2	18.7	35.6	19.3	5.21
The online booking platform's Internet site is aesthetically appealing	3.9	4.9	5.8	13.9	24.5	32.2	14.7	5.06
I like the way the online booking platform's Internet site looks	3.3	5.1	7.2	15.4	22.9	29.0	17.2	5.05
I think the online booking platform's Internet site is very entertaining	5.4	9.2	9.9	26.2	23.8	15.3	10.3	4.41
The enthusiasm of the online booking platform's Internet site is catching, it picks me up	10.2	11.1	16.2	22.8	19.9	12.4	7.4	3.98
Playfulness								
Shopping from the online booking platform's Internet site "gets me away from it all".	11.8	11.0	12.6	20.3	18.0	15.6	10.7	4.11
Shopping from the online booking platform makes me feel like I am in another world.	12.8	13.2	14.8	21.0	17.8	12.2	8.1	3.87
I get so involved when i shop from the online booking platform that I forget everything	20.8	14.2	13.8	19.8	15.4	10.2	5.8	3.48
I enjoy shopping from the online booking platform's internet site for its own sake, not just for the items I may have purchased.	18.5	14.0	13.3	18.8	17.4	10.1	7.9	3.65
I shop from the online booking platform's internet site for the pure enjoyment of it	20.5	13.3	15.1	16.9	15.5	11.5	7.2	3.57
Customers return on investment (CROI)								
Shopping from the online booking platform is an efficient way to manage my time	8.1	8.8	9.3	15.4	20.8	20.3	17.3	4.62
Shopping from the online booking platform's Internet site makes my life	4.8	6.9	6.9	14.5	20.1	24.2	22.5	5.01

easier								
Shopping from the online booking platform's Internet site fits with my schedule	5.1	7.2	10.1	19.1	20.0	23.1	15.5	4.73
Service excellence								
When I think of the online booking platform, I think of excellence	7.3	9.7	11.6	21.1	21.8	19.2	9.3	4.35
I think of the online booking platform as an expert in the merchandise it offers.	6.1	8.1	11.1	19.5	24.3	19.7	11.1	4.51

Table 2: Percentages and Mean Scores of the component ratings of experiential value

Gender differences

Gender differences of experiential values were explored using t-tests for independent samples (SPSS ver. 25) with regards the constructs comprising it, i.e., aesthetics (A), playfulness (PL), customer return on investment (CROI) and service excellence- SE (Table 3 and Table 4).

Variable	Gender	N	Mean	Std. Deviation	Std. Error Mean
MFS_A	Man	406	4.6438	1.41077	.07002
	Woman	564	4.8124	1.28825	.05425
MFS_PL	Man	406	3.6808	1.68114	.08343
	Woman	564	3.7777	1.57236	.06621
MFS_CROI	Man	406	4.6174	1.63225	.08101
	Woman	564	4.9072	1.56103	.06573
MFS_SE	Man	406	4.2919	1.59912	.07936
	Woman	564	4.5328	1.49727	.06305

Table 3: Group statistics of gender of the components of experiential values

The t-tests unveiled that for two out of four constructs of experiential values gender differences do exist, while one more can be marginally considered too. Specifically, as regards the aesthetics component (A) of experiential values, the t-test showed that the results may be considered as statistically different on a marginal level ($F=3.818$; $p=0.051$), thus women experience higher value from the aesthetic components as compared to men.

Referring to the playfulness (PL) component, results indicate that gender differences do exist ($F=3.983$; $p=0.046$), with women experiencing higher value from the playfulness component in comparison to men.

In relation to the customer return on investment (CROI) component, results demonstrate that the null hypothesis is accepted revealing no statistical differences between genders ($F=1.689$; $p=0.194$).

Lastly, with respect to the service excellence (SE) component of experiential values, results reveal that the null hypothesis is rejected and that the two genders differ in experiential values ($F=4.342$; $p=0.037$).

Dimensions of experiential value		t-test for Equality of Means						
		t	df	Sig. (2-tailed)	Mean Difference	Std. Error Difference	95% Confidence Interval of the Difference	
							Lower	Upper
MFS_A	Equal variances assumed	-1.932	968	.054	-.16857	.08727	-.33983	.00269
	Equal variances not assumed	-1.903	823.650	.057	-.16857	.08857	-.34242	.00528
MFS_PL	Equal variances assumed	-.919	968	.358	-.09687	.10536	-.30363	.10988
	Equal variances not assumed	-.909	836.928	.363	-.09687	.10651	-.30593	.11219
MFS_CROI	Equal variances assumed	-2.798	968	.005	-.28980	.10356	-.49304	-.08657
	Equal variances not assumed	-2.778	849.094	.006	-.28980	.10432	-.49456	-.08505
MFS_SE	Equal variances assumed	-2.403	968	.016	-.24093	.10028	-.43772	-.04414
	Equal variances not assumed	-2.377	837.525	.018	-.24093	.10136	-.43987	-.04198

Table 4: *Independent Samples Test*

DISCUSSION

The current study offers significant findings that can help researchers develop a better understanding of gender differences on the experiential values of the Gen-Z cohort towards e-booking travel platforms. First of all, it becomes apparent that the Gen Z cohort tourists hold in high regard the acquisition of experiential values from the use of the platform. Results made evident that, though, that young men and women show distinct in regard to three out of four dimensions of the experiential values construct. These findings are aligned with previous studies (e.g. Choi *et al.*, 2012; Hassuneh and Bergman, 2014) that reported gender differences between Internet users and users of online gaming environments. As anticipated, women appreciate more the aesthetics dimension of experiential value, since they are more sensitive to sensory stimuli (Liang *et al.*, 2013). In alignment to previous research, women also tend to appreciate higher than men the escapism element (Hassuneh and Bergman, 2014) which can be associated with the playfulness dimension of the experiential value. Furthermore, service excellence from the online booking platform constitutes a key element that adds value to female consumers. Contrary to our expectations, both genders highly regard the customer return on investment parameter of experiential values, since no gender differences were found in relation to this aspect.

In addition to its contribution to the academic research, this study also offers valuable information and managerial suggestions for online travel businesses and tourism organizations. Today's marketers' function in a more targeted manner and need in-depth information about generation Z, namely the youngest adult generation. Elements such as aesthetics, playfulness, service excellence and return on investment offer value to this generational cohort and, therefore, businesses and organizations' online marketing channels should sharpen their strategies and tactics taking into consideration gender preferences as well.

Online travel services could benefit from the findings of the present study accommodating the information provided on how to ameliorate the experience of these young tourist-customers in their strategy and, consequently, reinforce consumers' visits to their e-booking platforms. The latter is of utmost importance, especially for Gen Z an understudied generational cohort which comprises the main stream of the youngest adult customers of today and the near future.

LIMITATIONS AND DIRECTIONS FOR FUTURE RESEARCH

The study presented here has certain limitations that could be used as drivers of future research, with three of these limitations being the most dominant. The first one is that it encompasses an online data collection method, thus it incorporates a non-probability sampling method. Consequently, the results of this research cannot be generalized onto the total Greek Gen Z cohort, and a future research that would be employing a probability sampling method could lead to generalization of current results. The second limitation of this study is that it is limited to one generational cohort and, thus, it does not incorporate a wide range of age-spans and cohorts. And last, this study is based on Shobeiri *et al.*'s (2018) questionnaire measuring experiential values, implying that more constructs may be that measure experiential values from online booking platforms, which are not examined here. Therefore, a research with probable new or additional constructs would be of interest adding enriched knowledge to this cohort's consumer behaviour.

Despite the limitations mentioned above, its contribution is essential in providing information on tourism behaviour as it engages the Gen Z cohort, which continues to be an understudied cohort.

SCHOOL MEDICINE–THE PREVENTION KERNEL FOR FUTURE GENERATIONS' HEALTH

Stefănescu, Alexandru Mihai¹; Stefănescu, Alexandra Rodica²

²ANIMA Clinic Bucharest, Romania

ABSTRACT

Health is both a complex concept and a state, partially understood, lately recognized, and underestimated in the life cycle of the human being. The adaptation to reality of modern society is often done by ignoring the basic of knowledge and value – the grounds of education gathered in family, school or church. The lack of self-interest in own person, caused by low education, lack of well-being and limited incomes inside the family, is a harmful attitude finding its deep roots in frustration, unhappiness, low self-esteem, lack of access to correct and valuable health information, in illness or specific consequences of it. This general attitude is granted today as a national security issue linked to dramatic consequences requiring economic, social, demographic strategies in any country. To increase life expectancy and possibility of work, a preventative educational-sanitary management is needed, based on a sustainable development and supported by actions meant to: reconsider the types of care in favor of the primary one, implement preventative school health education under long-lasting monitoring and durable evaluation, outpatient treatment, reduction of hospitalization expenses, development of healthcare, education and nutrition.

The medical act needs radicalization by raising awareness on individual and societal supreme values, by targeting realistically the needs, monitoring activities and developing the coordinates of true diagnosis, investigation and treatment.

The present research brings up the realistic situation together with potential future dramatic consequences if immediate measures, such those indicated here, will not be considered and taken at once.

Keywords: scholar medicine; governance; nutrition; management; health establishments.

FORWARD INTO GENERAL CONCEPTS OF HEALTH

Health continues to be considered the most valuable gift received by man from nature, the foundation of a harmonious life and full of opportunities. Its loss is perceived as a major damage to both the individual and society [Clark *et al*, 1997]. Unfortunatley, people appreciate more the material values

and the accumulation of richness and less the value of their own health, until its deterioration becomes material, financial, physical, and emotional. Most of them become too late aware of the real situation when are obliged to face the consequences of serious diagnoses limiting their body and mind good functionality. The drama is even greater when adults ignore the consequences of losing their children's health by failing to observe the basic living conditions, behavior, work, attitude towards the others inside the community. The paradox has general roots – despite the science progress, the dissemination of good knowledge in the health field is rather sporadic, lacunar and especially without scientific basis. The lack of health education is always tightly linked to poor education or school drop out because school and healthcare are the pillars that mark the durable development of any individual and society.

People hardly know that there are diseases related to no prior symptoms. Thus, many young mothers do not realize the consequences of a disordered life – over-eating, smoking, over drinking coffee and alcohol, work exhaustion - determine their future children's health and contribute decisively to their body balance and mind consonance for the rest of their lives. It is more and more common to give birth to or grow up children with chronic illnesses, cardiac malformations or other rare diseases because human bodies usually adapt bivectorally to the socio-environmental realities. Cardiac abnormalities arise from heart or blood vessels normal development associated with: • possible contracting infections in the third trimester of pregnancy, • consumption of exciting products - drugs, coffee, cigarettes and alcohol throughout the pregnancy. Once diseases appeared, they require expensive treatments and long-life monitoring and expensive operations. The path of life is often shortened by diseases caused by negligence in eating.

Increasing school dropout deprives young people of the knowledge of food management. The development of fast and junk food technologies and innovations shows that people are already prisoners of the copy-paste behavior because they do not know how, what and how to eat. More and more live to eat and not eat to live. The cases of obesity increase in number and complications and, worryingly, they catch more children, adolescents and students than seniors. The golden age of consumerism completely altered the young people's behaviours. The youth get accustomed to eating more tasty stuff than healthy. They prefer fast food restaurants, cafes and bars to classical places with physical entertainment, proactive education and outdoor sports. They give up the fruits and vegetables for technological products - the first enemies of obesity. Few know that obesity can lead to the dramatic conditions of health: abdominal hernia, varicose veins, flat foot, bronchitis, hypertension, diabetes, hypercholesterolemia, heart disease.

Today it is known that most chronic diseases are due to sedentariness and a passive lifestyle: too much food, drink, smoking and too little movement followed by an inappropriate approach of social

and working relationships are the pillars of a bad time management, inadequate professional activity and deficient institutional relationships.

In the absence of the job security, the effort to increase family income is directly proportional to the rise of the negative effects of non-observance of sleep hours, neglect of a scientific nutrition, which ultimately leads to losses.

When strategic management is drifting away, it is no longer built by clinical, community-based corporate participation. In this situation, performance is calculated in net profit and dollars or euros that only enter a few pockets; the consequences - at the individual, institutional and societal level [Tarlov *et al*, 1989] take over the illusory curve of the moment gain that departs from the fundamental values characteristic of the human being. Also, at the societal level funds for education and health are decreasing, consumption of cheap and unhealthy products exponentially increases in parallel with the number of diseases and patients. The general health status of individuals, built on societal hate and envy degrades if inhabitants do not decide to leave the country and go to places where the supervietuire effort can be even higher than in the country but the effects of high self-esteem and recognition compensate it.

In order to increase life expectancy and the possibility to work, the curve of sustainable development must take a completely different aspect built on: preventive monitoring, outpatient treatment, reduction of hospitalization's costs in establishments, switch on care function through healthcare, education, nutrition. In other words, the medical act should be radicalized by focusing on real needs, through permanent monitoring and development of true diagnosis, investigation and treatment coordinates [Watson *et al*, 2013].

The complete definition of concept of health is an integrated part of health policies, executive strategy designed to contribute to improving the health of the population, and of all management programs. The national state of health manifests itself under the influence of the health determinants - which can be modified to improve the scores of a good life together with those factors cross-sectorally controlled by sectoral policies. Intersectorial action on health is considered essential to achieving equity in health keeping in mind that progress depends on aggregated decisions and correlated actions.

The determinants of health [Crespo *et al*, 1996] refer to factors proven to have a good or bad influence on health. Health determinants include the social, economic and physical environment, as well as the particular characteristics of the individual and the behaviors [Crespo *et al*, 1996]. Social and economic conditions - such as poverty, social exclusion and unemployment - are strongly correlated with health. These contribute to health inequalities, explaining why people living in poverty die earlier and get sicker than people living in good living conditions [McQueen *et al*, 2012]. Socially privileged health factors can be understood as better social conditions in which people live and work. These determinants indicate the specific characteristics of the social context that affect health and the ways in which social conditions translate into impact on health. According to the WHO official definition, "health is a state of physical, mental and social well-being, not just the absence of disease or infirmity."

DIRECTIONS OF ACTIONS TO STRENGTHENING HEALTH REPUTATION WITHIN SCHOOL CARE PARTNERING

In the context of its promotion, health is seen as a resource for everyday life. [Cox *et al*, 1987] It is a positive concept highlighting social and personal resources as well as physical capabilities.

Promoting health is the process of enabling individuals and communities to increase control over the determinants of health and therefore improve their health [Cox *et al*, 1987]. This is a strategy in the field of mental, physical and social health, which can be seen on the one hand as a political strategy and, on the other hand, as an approach that makes it possible to straighten the lifestyle for the benefit of health. The health sector includes ministries and departments, health and safety social security systems, volunteer organizations and individuals, as well as groups that provide health services.

Health, by itself, is also a national resource of strategic value because the future of any country is based on the health of its future generations. By joining the European Union, it becomes a strategic

area of regional importance, part of the security and health strategy that our country has joined. As strategic progress, health needs good governance.

The concept was imposed in the economy at the beginning of the 19th century. Nowadays it has also existed in the area of medical business and sanitary management (clinical governance). With him he identified the need for the management decision to be combined with the medical decision so that the bank exploits the risk mitigation effect and social, institutional and human profit by meeting all the specific operational and sectoral requirements and ensuring social cohesion, coherence economic and financial, harmonization of requirements with the rehabilitation and possibilities of local sanitary logistics.

The adoption of the European Union's strategy on health and safety at work has as strategic objectives:

- the global approach to well-being at work by taking into account changes in the world of work and the emergence of new risks, with the aim of increasing the quality of work, reducing the number of accidents at work and preventing occupational diseases;
- taking account of demographic change in terms of risks, changes in employment patterns and contractual arrangements, work organization and working time; analysis of new risks;
- Strengthening a culture of risk prevention by combining a variety of political-legislative instruments, social dialogue, measures and good practices, social responsibility and economic incentives based on building partnerships between health and safety stakeholders:
- education, awareness, anticipation, accentuation of risk awareness and more effective enforcement of existing legislation;
- the existence of an adequate social policy that is a factor in the competitiveness equation, knowing that "non-policy" generates risks.

European countries have made significant gains in population health, but there are still great inequalities in health, both between and within countries.

The Health 2020 concept is based on the values enshrined in the WHO Constitution, which seeks to ensure "the highest standard of health" as the fundamental right of modern man.

As European social states are restructured, there will persist the need for constant vigilance and the active promotion of a policy of true values based on civic rights and attitudes. The idea of assessing the state of health in Romania and identifying ways to re-establish the health policies is an integral part of the central objective of my doctoral research. In this context, the purpose of my research will ultimately be to identify those indicators that reflect the medical and budgetary reality, on the one hand, and the reality of Romanian society on the other.

THE LINK BETWEEN SCHOOL, DIET AND HEALTH

Hippocrates outlined the first the primacy of health food: "give your diet your first medicine". As already stated, the accelerated rhythms of today directed the people to consume more fast-food than traditionally cooked food, use the microwave to heat processed and ready for use products.

Fats, sugars, auxiliaries and dyes, pesticides highly present than ever in processed food are also sources of multiply pathologies: obesity, diabetes, anorexia, bulimia, cancer, depression, Alzheimer's and Parkinson's, cardiovascular disorders, gastric disorders. If people do not become aware of the evil they make themselves, nobody can convince them to take action for their own health. Only true reflection can make transition to a diet that fits our desires, our ethics, our organization and our way of life. The first choice is, above all, to give one time to get information and get advice from professionals. And this can happen in the best way in the nursery, at kindergarden or school, in any place where teachers, mentors, medical assistants and general practitioners are present and ready to share their knowledge with all pupils, students, family and friends.

Frustration and the feeling of having to get rid of what one likes are the greatest obstacles to being healthy. But tastes and flavors are infinite, and a change in habits - reducing fats, salt and sugars - can also lead to upper pleasures to eat, to new and unsuspected physical sensations of well-being. The change comes along with a better quality of sleep, mental and physical balance, and energy found in good nutrition will be valuable allies in this change. Changing diet and food can help discover new cereals and legumes, new flavors, new smells, and new compositions of better quality food. By reducing the amount of meat and dairy products whose consumption is dangerous budget, health and environment, the balance of a better life can be found together with better results in school, study, work and research, with optimistic feelings for life, work, good entertainment and nature because of the emotional roots that one can discover in the high quality food. Foods are closely linked to our emotions. Compulsive disorders Anorexia and bulimia reflect the anxiety and stress of modern society, habits and modes of behavior inappropriate for the needs of individuals; young people are even more fragile.

Diet change is often considered synonymous with frustration, lack, loss of time, excessive cost.

Help and assistance from associate professionals (naturopath, homeopath, acupuncturist) are often needed to crossover the transition period and speed up the finding out the personality of each person in need.

METHODOLOGICAL ANALYSIS OF HORIZON 2020 FRAMEWORK IN COMPARISON WITH THE ROMANIAN STRATEGY

By comparative analysis, the National Health Strategy 2014-2020 is more clearly defined by objectives, mission, vision, goal and basic principles. It represents the commitment of public health decision makers to ensure and promote health as a key determinant of a sustainable development of Romanian society, including socially, territorially and economically, as the engine of progress and prosperity of the nation. The strategy provides the overall framework for intervention to eliminate the identified weaknesses in the health sector by: reducing important health inequalities, optimizing the use of resources in health services in increased cost-effectiveness with evidence-based medicine and, last but not least, to improve administrative capacity and management quality at all levels.

As a European country, Romania has the obligation to align national legislation in the field of health and safety at work; this alignment has begun since 2007 but it has not yet been completed. The data from the extended research refers to the case law developed in the family medicine cabinet, in correlation with the public statistical data.

Interventions have been done in different sectors: • Legislation: Public Health Act (1972, Tobacco control, Changes to some foods, eg blending vegetable oil and butter; • Regulations: public places have been declared tobacco-free areas, the Health Promo Lunch Board was introduced; • Industry: healthy food products have been developed and promoted in collaboration with local authorities, civic organizations, shops, supermarkets and the food industry, low-fat saturation dairy products have been developed and marketed in collaboration with local and national producers, low-salt products have been developed in collaboration with local bakeries and other parties of the food industry, a new type of oil processing plant has been developed that has been effective in lowering cholesterol, a wide-ranging collaboration to promote farms supplying forest fruit products; • Media: raising public awareness of health risks of smoking has been done through media, health services and community organizations, television smoking cessation courses, reduction of serum cholesterol levels, education campaigns for health care has been done using a wide variety of channels including TV, newspapers, care system, schools and volunteer organizations, cholesterol measurements have also been widely used for education purposes, the goal was that everyone should know their cholesterol levels; • Education: home schooling has been done through active collaboration with schools and educational institutions in relation to nutrition education, special emphasis has been put on reducing salt and changing fat content in menus at work, stop smoking has been sustained by organizing smoking cessation courses in local health centers and workplaces, non-smoking prevention programs were organized in schools, wide-scale education activities were conducted on reducing the non-

pharmacological base of blood pressure and reducing cholesterol in the blood by changing diet and physical activity.

CONCLUSION

The medical world today is, beyond its complexity, a complicated puzzle of needs and desires, limited resources and unprivileged laws, structured logistics, and governance in chaos. Today, health clinics are compelled to adhere to the strictest rules of governance, while central administration institutions advocate priorities related to personal or group interests.

Clinical Governance is the tool that stops very professional doctors from deviating from moral rules, from those required by the Code of Ethics and Conduct. Its rules ensure decision-making collegiality that keeps the executives from sin breaking them, with or without their direct will. Well, in Romanian health there is no Clinical Governance. Decisions are taken by those who direct the activity and are not challenged by anyone. It is more expensive to apply rules, it is more expensive to hire councils of independent people, but it is more expensive if we do not. The only difference is related to the costs of establishing rules that are visible, while the damage caused by their non-existence is invisible. Our State Hospitals are owned by the County Councils or by the Mayors. How much would be the effort to create Trust Boards in which members of local communities, business people, members of civil society, teachers, artists, and anyone else could oversee the conduct of a fair and objective activity?

There is, of course, the variant established by the other state companies in which the members of the councils are party members, made to cover what is happening below them. But the key question is how could we set up rules to avoid conflicts of interest as we want to legalize a "threshold" below which they can not be legally investigated? Could the supervisory councils sanction such practices before the courts? Quite unlikely, but it would be a solution. However, such a solution seems to be the first logical step towards a restructuring of the health care system, and a decongestion is absolutely necessary in the onset of a general efficiency of the system. Until then, any good measure will be crushed by local donkeys as long as there are no rules accepted by everyone.

Cultivating health education through changing lifestyles has not only medical but also social, economic and institutional-societal implications that need to be known and deeply implemented [WHO, 2013].

DYNAMIC CAPABILITIES AS BALANCING: THE INTERPLAY OF ORDINARY CAPABILITIES, SIGNATURE PROCESSES, AND ORGANIZATIONAL IDENTITY

Tagliaventi, Maria Rita¹; Carli, Giacomo²

¹Department of Sociology and Business Law, University of Bologna, Bologna, Italy

²Department of Strategy and Marketing, The Open University Business School, Milton Keynes, UK

ABSTRACT

Purpose - In this study, we investigate the still overlooked interplay between the functioning of dynamic capabilities and changes in organizational identity values. Dynamic capabilities' action of orchestrating resources and competences, and consequently organizational routines, can challenge how people define themselves as members of an organization.

Design/methodology/approach – Data on two in-depth qualitative case studies on cooperative companies in the retail and food sectors were collected using interviews and secondary sources (e.g. blogs, presentations).

Findings - Our grounded model shows how dynamic capabilities' action resides in keeping a balance between changes in ordinary capabilities, organizational identity values, and signature processes. These latter represent the idiosyncratic processes of a company that are based on its heritage and past choices.

Originality/value - We contribute to the literature on dynamic capabilities by explaining how they maintain ordinary capabilities, identity values and signature process in a state of dynamic balance to tackle opportunities and threats.

Keywords: dynamic capabilities, organizational identity, signature processes, organizational change, case studies.

DYNAMIC CAPABILITIES ACTION AND ORGANIZATIONAL IDENTITY CONSTRUCTION

Organizations that aim to sustain a capabilities-based advantage in the wake of environmental change (Helfat and Peteraf, 2009) should pursue an evolutionary fit with their environment by continuously morphing resources and competences (e.g., Helfat et al., 2007; Helfat and Peteraf, 2009; Zahra and George, 2002). It is specifically dynamic capabilities that enable firms to sense opportunities and threats in their environment (sensing), seize them with convenient actions (seizing), and transform and reconfigure assets, organizational structures, and routines (Teece and Pisano, 1994; Teece, 2007; Teece et

al., 1997).

A vibrant debate has flourished about their nature and functioning, which has pointed out that they can span from structured routines (Teece et al., 1997; Winter, 2003; Zollo and Winter, 2002), to simpler, experiential sets of action, plain rules, and even rational heuristics (Bingham and Eisenhardt, 2011; Eisenhardt and Martin, 2000). One of the major issues still undergirding the comprehension of dynamic capabilities is related to how they work and how they differ from ordinary capabilities (Arend and Bromiley, 2009). Zollo and Winter (2002) and Winter (2003) theorized that dynamic capabilities act at a high level by altering 'zero-level' set of routines, labelled as ordinary capabilities. In this perspective, however, grasping how dynamic capabilities work and how they act upon ordinary capabilities risks ending up like a set of Chinese boxes in which multiple higher levels can be disclosed, thus rendering the overall framework less and less intelligible (Arend and Bromiley, 2009). Along this line of reasoning, Helfat and Winter (2011) argued that the boundaries between the ordinary and dynamic domains continue being blurred also because the same capability could be categorized as ordinary or dynamic according to its use: it is ordinary if it focuses on preserving the status quo, while it can be dynamic if it alters the firm's ordinary capabilities, resources, or external environment.

More recently, in an attempt to advance the comprehension of how dynamic capabilities work, Teece (2014a, 2014b) proposed a different logic. He suggested that ordinary capabilities be inspired by best practices, whereas dynamic capabilities be rooted in signature processes. These latter are based on a company's heritage, which is made of its past history, managerial decisions, context specific learning, and irreversible investments (Teece, 2014a). For instance, at the Royal Bank of Scotland, the morning meeting between executives to discuss main events and important choices became the manifestation that decision making processes were inspired by the values of respect and accountability that distinguished the bank from its competitors and contributed to its competitive advantage (Gratton and Ghoshal, 2005). Specifically, signature processes 'embody a company's character and signify their idiosyncratic nature' and 'arise from passions and interests *within* the company' (Gratton and Ghoshal, 2005, p. 49). Since signature processes are idiosyncratic, they can make possible to defend the distinctiveness of dynamic capabilities (Teece, 2014b). Consequently, Teece (2014a) suggested that dynamic capabilities grow and change over time under the influence of some core characteristics inherited from the past that are embedded in the organization's history and in its central values, whereas ordinary capabilities are inspired by best practices that can be imported from the outside and are transient in nature. The values underlying signature processes shape dynamic capabilities, which in turn drive the resources and competences that are the building blocks of ordinary capabilities.

The link between dynamic capabilities and the values marked by signature processes calls into question the definition of what the core values of an organization are, and how they are constructed and agreed

upon over time. A fruitful view on the process that leads an organization to define and share core values to be enacted in its signature processes is offered by organizational identity. In a social construction perspective, organizational identity is insiders' common cognitive representation of who they are as an organization, and inspires individual and collective behaviour in the workplace (Gioia et al., 2013, 2014). A few recent studies have alluded or made more explicit reference to the possible relevance of organizational identity in the development of dynamic capabilities. In studying the long and demanding change process that enabled IBM to turn from a hardware to a service provider, Harreld et al. (2007) linked dynamic capabilities to organizational values. The articulate process of strategy insight and strategy execution introduced at IBM, which resonates with the sensing, seizing, and transforming model of dynamic capabilities (Teece (2007), is driven by IBM's values. On a related note, when examining the likelihood of ambidexterity interpreted as a dynamic capability, O'Reilly and Tushman (2008) posited that common vision and values foster both the exploration of emerging markets and the exploitation of mature markets. The above pieces of research, in spite of the different settings investigated and the heterogeneous methods employed, are based on a common assumption: organizational identity may hamper the adaptation of organizations to new environmental conditions and the modification of dynamic capabilities.. Eggers and Kaplan (2013) share this view when they describe the role played by cognitive schemas in interpreting environmental changes and taking strategic decisions. Organizational identity emerges as one of the possible lenses through which managers make comparisons between existing capabilities and environmental needs, mostly preventing them from taking novel actions challenging extant resources and competencies.

This view stands in marked contrast, however, to the perspective on organizational identity emerging from organization studies. Moving from the original definition of organizational identity as the central, distinctive, and enduring values, beliefs, and assumptions of an organization formulated by Albert and Whetten (1985), recent studies have downplayed the feature of enduringness to underline the potential for change of organizational identity over time (Gioia et al., 2013; Nag et al., 2007; Ravasi and Schultz, 2006), up to the point that Gioia et al. (2014) refer to it as 'adaptive instability'. Organizational identity changes can originate externally from environmental changes like competitive pressures, customers' needs, and institutional requirements (Ravasi and Schultz, 2006) as well as internally from discrepancies between current organizational identity and current or future desired image, i.e., how insiders think that outsiders see or would like to see their organization (e.g., Corley and Gioia, 2004; Gioia et al., 2014). When facing changes, in fact, organizational members question the basic features of their organization and engage in a vivid discussion about how and what labels and/or meanings of these features should change over time (Dutton and Dukerich, 1991; Gioia et al., 2013; Nag et al., 2007). The interest that insiders feel for organizational identity changes resonates with the essence of

organizational identity as a guidepost for organizational actions and decisions.

Since organizational identity concerns the core features and values of an organization that inspire individual and collective actions, and dynamic capabilities influence an organization's success, understanding the interplay between changes in organizational identity and the functioning of dynamic capabilities can help us grasp how basic decisions concerning the organization as a whole are intertwined and coevolve. Organizational identity does not necessarily crystallize dynamic capabilities and changes in both can occur in the wake of mutable external conditions, but how changes in organizational identity are connected to changes in dynamic capabilities is not yet well understood. A noteworthy link lies in the signature processes recently highlighted by Teece (2014a): the values deeply characterizing an organization are enacted and reflected in the signature processes that represent the framework for dynamic capabilities functioning. However, in line with the prevailing view on core values in strategic management studies, signature processes are currently deemed as being mostly stable over time and we are not aware of the way any modifications of values may influence how dynamic capabilities work.

As a consequence, tapping into the relationship between changes in organizational identity and dynamic capabilities is an opportunity to enrich our comprehension of how organizations interweave the definition of who they are, their daily actions, and their strategic decisions. Based on these premises, our research aims to provide an answer to the following question: How does organizational identity influence dynamic capabilities, and is in turn influenced?

DATA AND METHODS

Given the exploratory nature of our research question, we conducted a qualitative study based on an exploratory case study and developed a grounded model. Based upon suggestions from the literature and our research question, we looked for an organization that satisfied the following criterion: having coped with some environmental changes, since they are likely to act as threats or opportunities for dynamic capabilities and organizational identity. We first identified the retail industry as a relevant industry: due to the larger economic crisis and the consequent reduction in gross margins, the Italian retail industry had handled a fierce competition with international chains and their aggressive price policies. Second, we selected a top performer in this industry, which we gave the fictitious name of Good Stores. Founded at the end of World War II, Good Stores is one of the biggest cooperative companies operating in the retail distribution in three Italian regions with 111 stores (38 mini-markets, 64 supermarkets, and 9 superstores), and about 6,000 employees. The selection of a cooperative was also inspired by possibility to observe particularly evident and substantial processes related to identity typical of this type of 'non-conventional' and less studied organization (Jussila et al., 2012).

In order to develop our two case studies and follow the interplay between dynamic capabilities and identity over time, we collected and triangulated data from multiple sources (Jick, 1979; Miles and Huberman, 1994): interviews, documents, and online blogs.

As reported in Table 1, we interviewed 20 top and middle managers, employees, and external consultants that had been involved to tackle the decline in performance. Interviewees were asked to comment upon specific topics and questions related to: competitive and organizational situation, threats and opportunities handled, actions undertaken to confront threats and opportunities, new capabilities developed, the core features of their company and if and how they had varied over time, and if and how the routines they participated in had changed over time. We collected also slides and other internal and external documents (e.g. minutes of meetings, reports). Finally, Good Stores' employees run an online blog where they discuss organizational responses to opportunities and threats addressed by their organization. Likewise, a workers' union runs another blog with similar objectives. We collected all the posts and comments from these two blogs. Altogether, documents allowed us to follow longitudinally the main changes that the company faced, how the company communicated its main values internally and externally, and the set of routines that it adopted. Overall, our data collection covered a time span of eight years.

In analysing interviews, documents, and blogs, we adopted the framework described by Strauss and Corbin (1998) for grounded theory and followed a two-step coding process inspired by Bertolotti and Tagliaventi (2007) that allowed us to grasp recursiveness among categories (Clark, Gioia, and Ketchem, 2010). Due to paper length limit, we will reduce quotes to the minimum in the following section.

Category	Use in the analysis	Case A – Good Stores	Case B – Food Express
Interviews with managers, employees, and consultants involved in the change projects	Capture managers and employees' interpretation of organizational changes, new capabilities developed, change in ordinary capabilities and signature processes. Collect interpretations on identity-related issues, and grasp changes to identity attributes.	11 interviews: Visits to two stores during the interviews Follow-up interview with the Head of the Organization Office	20 interviews: Visits to five kitchens during the interviews Follow-up interview with a middle-manager from the Operations Unit
Blogs	Collect anonymous opinions and feedbacks from employees and clients on the changes in the two co-ops,	Employees' blog (1224 posts and 267 comments) Union blog (84 posts, 51 comments)	Employees' and associates' blog (438 posts and 372 comments)

	triangulating information from interviews with longitudinal data.		
Slides and other internal documents	Capture detailed information about organizational changes and new routines introduced into the companies. Triangulate information from interviews.	11 presentations (1473 pages)	9 presentations (294 pages)
Corporate biographies	Gain familiarity with the historical, organizational and strategic context of the two organizations. Collect detailed information on organizational events, decisions, and actions.	Co-op identity and change during years (3 accounts, 173 pp.) Account of company events from an insider top-manager (492 pp.)	Co-op identity and history (2 documents, 773 pp.) Analysis of corporate brand positioning since its constitution in 1945 (188 pp.)
Annual reports, financial statements, social responsibility statements	Track financial data and performance over years. Collect information about initiatives and events involving the company.	Annual reports Notes to the accounts (262 pp.) Social responsibility statements (1159 pp.) Chart of Values (27 pp.) Statute (96 pp.)	Annual reports Notes to the accounts (42 pp.) Social responsibility statements (1592 pp.)

FINDINGS

1. Identification of threats. Due to the large economic crisis and the consequent reduction in gross margins, the Italian retail industry was characterized by a fierce competition with international chains and their aggressive price policies. This revealed the inadequacy of extant organizational routines and the need to update the existing ordinary capabilities. Human resources and operations management current capabilities of Good Stores were not perceived as suitable to cope with the new challenges posed by the increased competition.

Our informants recognized also that the company could not tackle change internally and had to look for external benchmarks to improve its human resources management capabilities.

2. *Change in ordinary capabilities.* Good Stores top management took the decision to turn to external consultants with the objective of introducing new 'best-in-class' processes that would make internal human resources and operations management aligned with those of competitors and reduce operative and personnel costs. The new best practices introduced were inspired by specific methodologies for handling human resources in manufacturing companies and were complemented by approaches to address organizational change and empower cross-functional collaboration. By redesigning several organizational processes, the company renewed its human resources management capabilities introducing a flat organizational design, in which employees were dynamically assigned to the activities (e.g., warehouse logistics, replenishment of store shelves) required by the store departments. Consequently, every employee could serve in any departments based on daily necessities.

A more accurate planning of activities ensued from the changes introduced to operations management capabilities. Other best practices introduced in the organization regarded work methodologies facilitating business process analysis and reengineering, and lean management. For instance, management consultants involved in the change project provided guidance on how to interview employees to obtain operational information to reduce wastes and share it with the rest of the store chain.

3. *Change in organizational identity values.* At the time best practices were introduced, Good Stores' organizational identity was characterized by two common attributes: the centrality of employees and the focus on employees' skills. For instance, our informants mentioned the very nature of the organization, i.e., the fact that it is a co-op and therefore differs from most private and public companies, because it is '*centred on its employees*'. Being central to their organization means, in employees' interpretation, that the company fosters their growth through a continuous investment in their skills.

The fine reengineering of core processes in the stores, the introduction of formalized and structured ways of working based on human resources management best practices, and the use of new

performance indicators, gradually paved the way for the inclusion of a new value, i.e., efficiency, into the organization's identity. Organizational members started embracing the relevance of efficiency—whose meaning could be traced back to sensitiveness to streamlining and eliminating all that is unessential in everyday activities—as a core attribute of Good Stores.

4. *Change in ordinary capabilities.* Inspired by the newly internalized value of efficiency, Good Stores management prompted further changes in the ordinary capabilities related to human resources and operations management without the help of consultants: they introduced a new routine for making staff assignments to tasks more efficient. Consequently, the human resources pooling procedures proposed by consultants were internally redesigned to be more flexible, allowing to change employees' assignments during the day, hire temporary workers to handle rush hours, and relocate some of the employees working in the warehouse logistics and distribution centres to external co-ops with adaptable outsourcing contracts.

Moreover, with the aim of reducing costs and ruling out unnecessary activities, management attempted to improve stock management capabilities to lower levels and perform a more accurate control on expiration dates through a new sophisticated stock management. This reduced the necessity of a workforce dedicated to stock planning in each superstore, as planning was centralized at the headquarters site.

5. *Change in organizational identity values.* These further changes in human resources and operations management ordinary capabilities prompted a perception of ambiguity in organizational identity values. Insiders stated that they were '*puzzled*' about who they were becoming as an organization, as many informants declared. The feeling of confusion about the key attributes of their organization lied in the perception that organizational members were no longer confident about the meaning of employee centrality, which was a value deeply rooted in Good Stores identity as a co-op. They argued about a contrast between employee centrality and efficiency. The resort to extreme resource pooling practices and the outsourcing of employees to external co-ops undermined the interpretation of employee centrality. Some informants underlined how they believed that efficiency would '*cannibalize*' the centrality of employees.

6. *Change in signature processes.* The crisis of organizational identity turned out to impair what we identified as the signature process that had long characterized Good Stores. Its signature process used to consist of meetings open to managers, employees, and clients twice a year: on these occasions, participants of the local area of a store would talk about Good Stores' core features, mission, and future steps to be taken to improve the services. Meetings used to be largely attended and considered '*an integral part of Good Stores' way of being*' (post on a blog). People would intervene and voice their opinions, discuss recurrent issues, and provide advice, and were convinced that '*the sharing of our points*

of view makes the difference', as acknowledged in interviews. Once bafflement about the centrality of employees spread across the organization, meetings lost their sense and were gradually deserted by employees. Organizational members started referring to these meetings as a *'mere role playing devoid of any substance'* (comment on a blog).

7. *Identification of opportunities and threats.* The loss of meaningfulness of the signature process led to a diminished commitment towards Good Stores that culminated in a wave of strikes that hit the company in almost all of its stores. In parallel, sales and customer satisfaction decreased: an inquiry into customers' claims disclosed that they complained about the lack of skills of the personnel serving store departments, who were not able to respond to specific requests and often seemed to have no knowledge at all of specific products. Clients' engagement in company meetings decreased because of their perception of the loss of familiarity with the employees serving in their local store. This critical situation was recognized as a threat by the headquarters management, as our informants recounted. Heated discussions on how to solve the problem led to a rethinking of ordinary capabilities.

8. *Change in ordinary capabilities.* Stakeholders' negative reactions turned into an opportunity to revise ordinary capabilities. First, management engaged in the revision of human resources management capabilities to meet customers' expectations about a higher level of competencies and service in the stores and the connection with the company's heritage. Top management proposed to revamp the strong ties between employees and clients by providing the local communities with specific services. To do so, store and middle managers were asked to hold various meetings to discuss with the workforce how to offer more fine-grained services locally through new initiatives. Additionally, resource pooling practices were redesigned introducing specialization of human resources based on differentiated roles and career paths, while preserving a process orientation.

9. *Change in organizational identity values.* Changes in ordinary capabilities helped overcome ambiguity in the meaning of employee centrality and its relationship with efficiency as core features of Good Stores. The growing room left to employees' opinions and initiatives, alongside the new framing of outsourcing efforts as an opportunity for employees to *'test new pathways and advance competencies'* (from a blog), imbued organizational members with a new awareness of their relevance to the organization. Insiders came to see themselves as *'entrepreneurs'*, as recurrently stated by our informants, and, consequently, employee centrality became associated to proactivity both within and outside organizational boundaries. In the wake of their ability to grasp the expectations and requirements of different actors, such as institutions and local population, employees interpreted this value as *'giving voice to organizational members and expanding our outreach in the community'* and would refer to it as *'having a territorial vocation'* (store manager).

In this perspective, employee centrality and efficiency were no longer interpreted as potentially

conflicting values. Employees believed that bringing up new ideas about how to preserve the environment was in line with the true meaning of the efficiency value, since reducing environmental wastes implied *'a careful exam of which activities are to be sponsored and which are just costly and unproductive'* (Good Stores internal magazine).

10. *Change in signature processes.* The new meaning attributed to employee centrality revamped the traditional signature process characterizing Good Stores. Since employee centrality was interpreted as being entrepreneurs with a territorial vocation and was correlated to being an efficient company, top management gave impetus to meetings in a different way. The co-op members at large as well as local institutions' representatives were invited to participate in the meetings alongside managers and employees. Held thrice a year in theatres, cinemas or convention centres, meetings became the chance to invite the local communities to bring up new ideas and desires.

11. *Identification of opportunities and threats.* The impulse given by top management to signature processes and the wide participation of employees led shortly to stakeholders' positive appraisals. About five hundred employees were interviewed every year through an internal survey, and the social responsibility report that we read at the end of our case study timeline described *'a diffused good organizational climate, with some demands for specific training programs to improve personnel specialisation'*. Both employees and customers were involved in the renovation of some stores and the setup of specific spaces dedicated to social events and community initiatives.

DISCUSSIONS AND CONCLUSION

The grounded model that we present in Figure 1 advances our understanding of dynamic capabilities by claiming that they work through the identification of threats and opportunities and a continuous search for consistency between ordinary capabilities, organizational identity values, and signature processes. Specifically, the company under study recognize threats and opportunities in its environment. The perception of an internal lack of competences suitable to handle environmental pressures leads to the introduction of new best practices and the development of new ordinary capabilities. This change triggers the search for consistency between organizational identity values, ordinary capabilities, and signature processes, in an interplay with the elaboration of the feedbacks received by relevant internal and external stakeholders; these latter act, in turn, as further threats or opportunities. When feedbacks signal that insiders and outsiders' reactions are negative, organizations modify ordinary capabilities, thus giving a new impetus to the balancing cycle. Dynamic capabilities therefore work by keeping ordinary capabilities, organizational identity values, and signature processes in a continuous balance under variable conditions. The arrows in our model display the possible directions of the longitudinal influence of each variable on the others. They show that a change

in one of the four core variables (threats and opportunities, organizational identity, ordinary capabilities, and signature processes) can trigger a change in another one, in the pursuit of a continuous balancing action sustained by internal and external stakeholders.

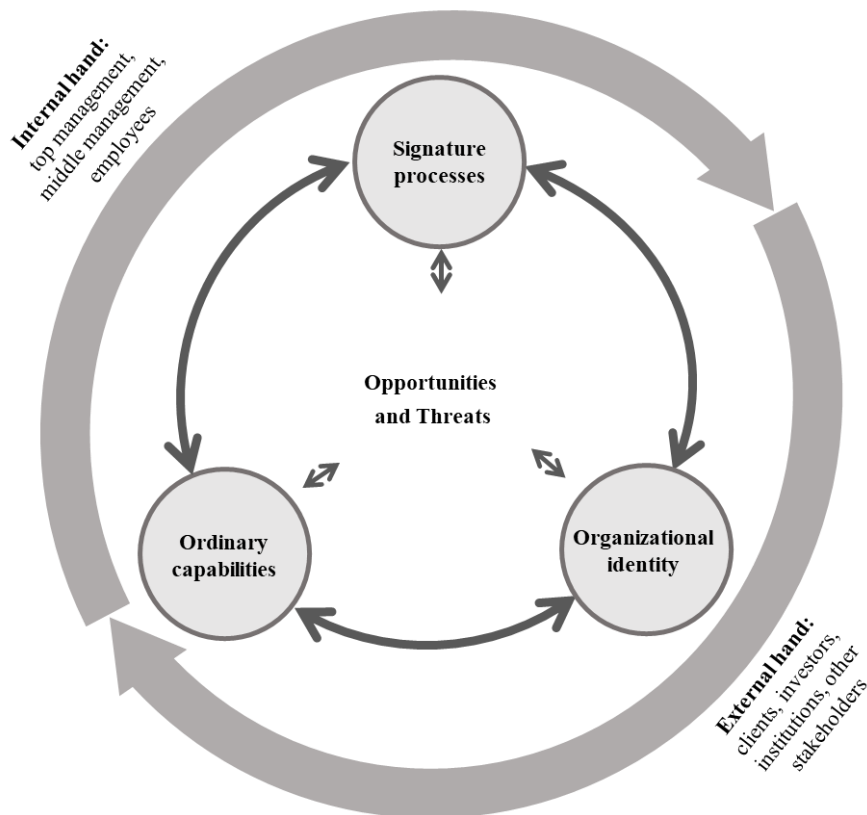

Figure 1. *A grounded theory on dynamic capabilities*

Our grounded model responds to the question of how the functioning of dynamic capabilities influences, and is influenced by, changes in organizational identity values. Organizational identity emerges as a relevant factor in the enactment of dynamic capabilities that has been surprisingly overlooked so far. When taking organizational identity values into account in fact, one can get a new insight on the adaptive nature of dynamic capabilities. Our findings show that dynamic capabilities imply the continuous effort to attain consistency between who the organization is (organizational identity), its distinctive processes (signature processes), and the basic routines that embody its resources and competencies (ordinary capabilities). Unlike punctuated equilibrium models (e.g., Romanelli and Tushman, 1994), consistency is not an intermittent or transitory phase of equilibrium alternated with dramatic disruptions, but is the ongoing state of a system maintained in continuous evolution by dynamic capabilities.

When we claim that the action of dynamic capabilities involves organizational identity and signature processes, we advance Teece's conceptualization of signature processes by highlighting its relationship with identity (2014b, 2014a). Scant previous literature linking dynamic capabilities and organizational

identity was rooted in the assumption that organizational identity values are essentially stable over time (e.g., Teece, 2007): consequently, signature processes were interpreted as fixed, too. Conversely, we disclose that organizational identity values can change—new values can be added, long-held values fade, and the meanings of some values be altered. In this sense, our work testifies to late studies on organizational identity that underline the likelihood that identity may change over time (Gioia et al., 2000, 2014; Kreiner et al., 2015). From the perspective of dynamic capabilities as a balancing act, modifications in the core values of an organization engender modifications in how its resources and competencies are arranged (ordinary capabilities) and in its deeply characterizing processes (signature processes) so as to attain an overall consistency. In raising the issue of the relevance of signature processes in the comprehension of dynamic capabilities, Teece (2014a, p. 334) posed emphasis on organizational heritage and previous management decisions. In contrast, we argue that dynamic capabilities can extend their action towards a revision of the values and beliefs of the organization. If signature processes are an emergent construct that can further our comprehension of the functioning of dynamic capabilities, the awareness that signature processes cannot be taken for granted, but are subject to change, fleshes out their effect for organizations. Signature processes can change during time, provided that the overall system be kept in a continuous balance. They emerge from our field study as shared models of practice that embody a clear representation of core organizational values, and are influenced by various stakeholders' expectations, suggestions, and appraisals. This interpretation of signature processes resonates with Gratton and Ghoshal' conceptualization (2005): they argue that signature processes ensue from the company values and are developed through a championing action exerted by executives, inspired by the CEOs, or based on a shared education of the senior management team. Conversely, our findings show that employees play a central role in shaping what would later become a signature process, or in adapting existing signature processes, thus testifying to the still overlooked agency of employees in sponsoring signature processes.

Our findings allow us to offer another contribution to the dynamic capabilities literature that throws into sharp relief the role of stakeholders, both external and internal. Although reflection on dynamic capabilities has posed emphasis on the relationship between firms and their environment (Helfat and Winter, 2011), the process of interplay between environment and asset orchestration has been depicted as substantially internal and relying on dynamic managerial capabilities mostly (e.g., Helfat and Martin, 2015; Martin, 2011). Our work brings to the fore that opinions and preferences ensuing from the environment can be influential in directing dynamic capabilities functioning. Specifically, we unravel how interactions with various stakeholders that express expectations and evaluations about the organization accompanies and sustain dynamic capabilities, and, if taken into account timely by management, can help maintain the system in a fruitful balance. Stakeholders in fact provide impetus

for changes in ordinary capabilities that ignite subsequent alignment with signature processes and organizational identity. Being able to collect and analyse inputs from stakeholders and to turn them into hints for change acts as a corrective force able to keep balanced the core elements of the dynamic capabilities functioning: We may deem it as a dynamic managerial capability that top management should pursue for the sake of their organizations.

Our study raises managers' awareness on the identification and development of signature processes. If managers acknowledge the existence of a signature process in their company, they can evaluate its coherence with ordinary capabilities and identity values, and leverage the signature process to renew the ordinary capabilities. Alternatively, managers could notice that the signature process of their company is no more coherent with the values and the ordinary capabilities of their organization.

In conclusion, the action of dynamic capabilities implies keeping a continuous balance among the core elements of an organization: who we are as a company (organizational identity), how we deploy our assets (ordinary capabilities), and how we set our distinctive processes (signature processes). Hopefully, this research informs our understanding of how the capacity to maintain a mutable equilibrium among core elements is conducive to success.

THE INFLUENCE OF LIMINALITY ON ORGANIZATIONAL IDENTITY CHANGE

ABSTRACT

Purpose – This paper intends to analyse the relationship between organizational identity and liminality, bringing to the fore the role that individuals who are only temporarily involved in organizational decision processes can exert in elaborating visions about who organization can become and inspire changes in its core and distinctive values and beliefs.

Design/methodology/approach – This paper is a qualitative research based on three exploratory case studies conducted in three Italian companies.

Findings – The empirical evidence shows the interplay between organizational identity, practices, and liminality. The emergence of a perception of liminality in consultants as well as in clients' managers and employees is intertwined with the elaboration, dismissal, and reconstruction of practices, and with sensemaking about organizational identity.

Originality/value – This paper informs our understanding of the agency of organizational identity change that can involve a wider range of actors than organizational members and stakeholders, who have a well-grounded interest for the fate and success of the organization. The transitional participation of other actors like consultants, which can be likened to liminal experiences, can prompt a debate on how an organization can evolve, triggering a change process. Unravelling the influence of liminality on organizational identity expands also on the comprehension of the creativity offered by liminal experiences, which can touch upon the essence of host organizations. Finally, the possibility of liminal experiences to morph over time and to spur additional liminal experiences, thus introducing dynamism in the theoretical perspective on liminality, is highlighted by this study and discussed.

Keywords: liminality, consulting, organizational identity, organizational change

INTRODUCTION

Research on organizational identity has, over the past few years, emphasized the process through which it is discussed, constructed and reconstructed, thus enriching studies exploring its content, i.e., its core and distinguishing features (He and Brown, 2013; Kreiner et al., 2015). Attention to how the

response to the question 'Who are we as an organization?' may vary over time marks a substantial revision of the concept of organizational identity as the central, distinctive and enduring characteristics of an organization (Albert and Whetten, 1985). While organizational identity is still acknowledged to be about the central features of an organization, numerous studies have testified to its changing nature (e.g., Corley and Gioia, 2004; Kreiner et al., 2015), to the point that Gioia et al. (2014) refer to it as 'adaptive instability'.

Although the construction and reconstruction of organizational identity is considered to be mostly a sensemaking process managed by organizational members (Maitlis and Christianson, 2014), external actors can be influential. Organizational identity changes can in fact originate from environmental changes such as competitive pressures and institutional requirements (Ravasi and Schultz, 2006) as well as from discrepancies between current organizational identity and construed external image, i.e. how insiders think outsiders see their organization, or between construed and desired external image, i.e. how insiders would like outsiders to see their organization in the future (Corley and Gioia, 2004; Gioia et al., 2014). Outsiders' current or prospective expectations therefore are an influential trigger of identity change processes.

The understanding of how outsiders affect organizational identity change is rooted in the assumption that there are clear boundaries separating insiders from outsiders. Speculation on image has, in fact, indirectly stressed the boundaries between insiders, involved in sensemaking about organizational identity, and outsiders, receiving and elaborating information on the one hand, and conveying expectations and preferences on the other, about who the organization is or should be (Gioia et al., 2014). Subjects external to the organization therefore spark processes of identity change, but do not actively participate in them (Kjærgaard et al., 2011).

This view stands in sharp contrast with the acquiescence that the boundaries across organizations are becoming increasingly blurred (Sturdy et al., 2006) to the point that Sturdy et al. (2009, p. 631) state that 'the boundaries of organizations become so busy with border-traffic that it is difficult to judge where they begin and end.' The literature has accounted for many instances of ambiguity in setting organizational boundaries. Temporary workers are linked to their employing organizations by arrangements that are continuously negotiated and situate them in a 'transitory position, open to definition' (Garsten, 1999, p. 602); a similar perception of 'placelessness' is declared by mobile project workers (Borg and Soderlund, 2015). Transitions across organizations are also reported in the case of a financial director and a festival manager of two different companies collaborating to set up an arts event: during the cooperation, they gain in proximity to the partner's company while remaining affiliated to their employing organization (Ryan, 2019). From yet a different perspective, project managers experience a double kind of belongingness both to their firm and to the international

professional community of project managers, intentionally bringing practices and suggestions for change from one to the other (Hodgson and Paton, 2016). But the most acknowledged case of permeable and fluid boundaries concerns management consultants. Their formal affiliation with the consulting company, but at the same time their protracted involvement in the client company's activities, pose a serious question to their personal identity as well as to the nature of the relationship and the commitment that they feel towards the two organizations (Czarniawska and Mazza, 2003).

All the above situations can be traced back to the overarching concept of liminality. Originally developed in anthropological studies (Van Gennep, 1960), liminality refers to the passage from one state, e.g. adolescence, to another, e.g. adulthood (Bamber, Allen-Collinson, and McCormack, 2017; Soderlund and Borg, 2018). As a condition of change between something known (the 'before') and something still unknown (the 'after'), it is meant to represent a temporary stage in which ambiguity, indeterminateness, a loss of previously held meanings, and a precarious sense of self reign (Daskalaki and Simosi, 2018). Liminality has subsequently been embraced by organizational studies, which have delved into its being 'betwixt and between' (Turner, 1967), or, seen from a different viewpoint, neither inside nor outside a given organization (Ellis and Ybema, 2010). When used as a lens to investigate organizational phenomena, however, unlike its anthropological sense, liminality is often considered as a permanent state that is not preceded by any separation from something old nor followed by an incorporation into something new. Being a temporary worker or a consultant has not been regarded as a transient situation moving towards an end, then, but as 'social limbo' (Johnsen and Sørensen, 2015) in which rules and hierarchies are suspended and individuals strive to understand who they are, whom to interact with, and what actions to undertake (Beech, 2010). If liminality has been mostly explored as being positioned across different organizations, a recent study highlighted how the perception of liminality can emerge from within an organization as well (Swan et al., 2016): department or functional managers who also act as coordinators of knowledge-sharing communities can feel liminal between senior management and community members.

The benefits and drawbacks of liminality have been long discussed. The suspension of established rules and routines ensuing from liminality as anti-structure (Turner, 1974) fosters playfulness and creativity able to contrast the status quo (Garcia-Lorenzo, Donnelly, Sell-Trujillo, and Imas, 2018). Liminal actors in fact can be highly valued for their creative agency, as they are able to suggest new opportunities within elements of existing practice (Sturdy et al., 2009; Swan et al., 2016). At the same time, liminars enjoy freedom from organizational constraints and greater opportunities for learning across different work experiences (Garsten, 1999; Tempest and Starkey, 2004). On the other hand, downsides are experienced mostly at an individual level: consultants and freelancers can be uncertain about how to manage their work and personal life, feeling stress and anxiety (Beech, 2010; Sturdy et al., 2009).

The growing diffusion and relevance of liminality call into question our understanding of who may participate in organizational identity change processes, and how. If it is increasingly hard to distinguish between insiders and outsiders, and different types of liminality can pervade an organization at the same time—e.g. a company availing itself of both consultants and temporary workers to face a mutable market demand—then time is ripe to rethink the idea that outsiders inspire organizational images and insiders revisit and redefine organizational identity in light of outsiders' images. Liminal actors, who are 'oscillating between "in" and "out", "same" and "other", and between an inclusive and exclusive "us"' (Ellis and Ybema, 2010, p. 299), are likely to affect organizational fate and choices by 'dialoguing about dreams, plans, hopes and fears' (Hatch and Schultz, 2010, p. 592). We still do not know, however, how they exert influence on core organizational change processes. Our study has as its very goal to explore how identity change processes may be affected by liminality. Specifically, we pose the following research question: how does liminality influence organizational identity change processes?

DATA AND METHODS

Given the lack of studies on the influence exerted by liminality on organizational identity change, we opted for exploratory case studies (Yin, 2008). Following indications provided in the literature, we focused on consulting projects as likely contexts for liminality (Czarniawska and Mazza, 2003).

We adopted a theoretical sampling approach (Bell, Bryman, and Harley, 2018). We started with a first company, the coffee-maker ExpressCoffee which is the leader in the market of coffee machines for commercial usage, and gathered data through interviews and documents. In coding the data through a constant comparison procedure, a significant trigger of the emergent model linking liminality, practices, and organizational identity was the economic crisis that had begun in 2008 (Fusco and Migliaccio, 2018) and that had required the intervention of external consultants due to the lack of internal competencies suitable to handle it. We asked the consultants involved in ExpressCoffee to help us single out another company that had resorted to them as a consequence of the economic crisis that it was facing: a car design company that we labelled as CarDesign. We repeated this passage twice, selecting a third organization, a financial services provider that we called NearBank. The three companies that we studied, while sharing some characteristics—they are Italian, privately owned, mature, large enterprises in their own industry—differed in terms of the industry to which they belonged (financial services, coffee-makers and car design). Similarly, client companies' management also selected some internal managers and employees to support consultants throughout the project life span, giving priority to it over their ordinary tasks.

Employing a snowball sampling procedure (Bell, Bryman, and Harley, 2018) originating from the sales manager at ExpressCoffee and the consulting company's team lead for the ExpressCoffee project, we

ran 33 open in-depth interviews with organizational members and consultants (27 interviews and 6 follow-up interviews). These interviews lasted 1½ hour on average, were tape-recorded and transcribed in their entirety. We employed two different protocols in addressing organizational members and consultants. We asked organizational members to tell us what the rationale for the consulting project had been, what the consulting project was about, what insights it had conveyed, and if and how the changes that it might have engendered had inspired subsequent actions and decisions. In addition, we asked members to report what the central and distinctive attributes of their organization were, whether and how they had changed over time and what role the projects had played. When interviewing consultants, we asked them to describe the projects, how they had handle them, what changes the projects had prompted in the client companies, and how they had experienced them. We also used a wide range of documents, varying from consultants' documents to internal memos and meeting excerpts, for a total of about 1,800 pages, to complement the interviews.

In analyzing both interviews and documents, we followed a three-step coding process (Mattarelli and Tagliaventi, 2015) to build a grounded model (Strauss and Corbin, 1998) in which recursive relationships among categories are depicted (Clark et al., 2010).

FINDINGS

In this section, we present the evidence emerging from the three case studies according to the grounded model depicted in Figure 1.

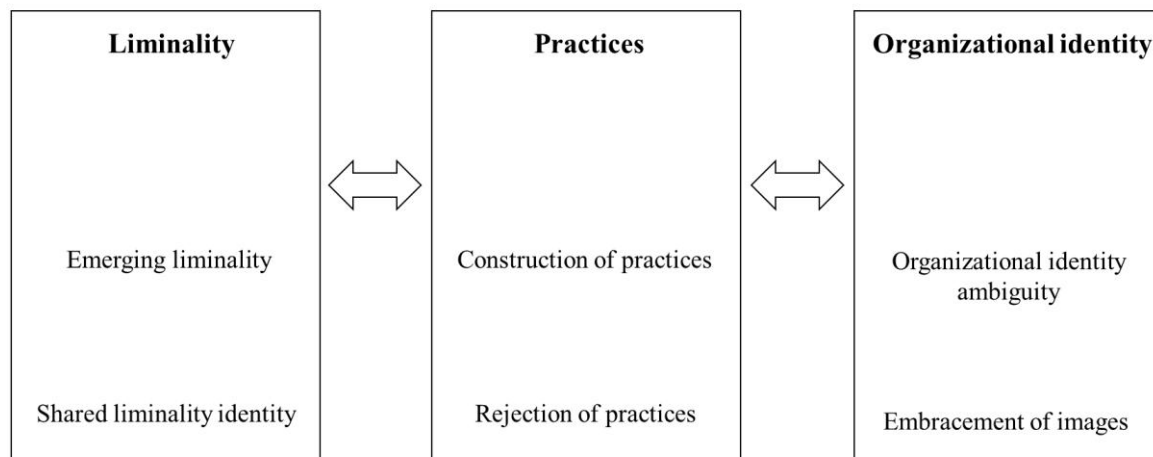

Figure 1. *Grounded model of the interaction of liminality, practices and organizational identity*

Construction of practices. Consultants initiated projects with a view of themselves and of their role as 'firefighters', as many informants quoted, i.e. as experts summoned to solve specific problems through the application of established practices. During the initial meetings of the three projects, consultants in fact proposed a set of practices functional to the projects and aimed at improving collaboration across

individuals working at the projects. Practices were coupled with a rhetoric inspired to the Age of Exploration to remark the innovativeness of the project and evoking separation ceremonies (Czarniawska and Mazza, 2003).

The initial stance of being *'The experts'* helped legitimize the practices related to process analysis and business modelling that were the bulk of the consulting projects and aimed at making employees and managers *'able to get inside things'*.

The suspension of the regular hierarchical relationships and the definition of new work practices defined by consultants to promote the project engendered an increasing detachment from well-established routines, as an employee from a branch of NearBank told us:

Consultants asked me to bring my experience as branch manager and work with other colleagues from the headquarters, without lingering on power relationships and on what was going on in the rest of the bank. It was a different moment for our bank when we were free to think creatively and create through thinking.

Emerging liminality. The involvement in project activities, the sharing of the same workspaces, and the practices introduced by consultants gradually loosened the ties managers and employees involved in the projects had with their colleagues, and entailed a perception of liminality. Participation in the projects in fact required them to spend time in common working areas and meeting rooms with consultants. Moreover, they had to critically analyze and even redesign the routines of their organization, nourishing a feeling of dwelling in a different time and space within their own organization (Atkinson and Robson, 2012; Kornberger et al., 2011): *'We felt literally spaced out'*, a NearBank employee stated. Project members' growing psychological distance was noticed by their colleagues, who would refer to them as *'The chosen'* at NearBank, *'The special forces'* at ExpressCoffee, or *'The foreign legion'* at CarDesign. Their lingering in a 'grey zone' was even fostered by top management in ExpressCoffee: *'They had to start watching the company from a distance, while preserving their nature as our members'* (CEO).

Organizational identity ambiguity. The joint work with consultants also stimulated managers and employees to reflect on whether the practices introduced by consultants contrasted or sustained the *'essence of our company'*, as CarDesign COO declared. Since organizations tend towards an alignment between identity and practices (Canato et al., 2013), employees and managers started wondering whether analyzing their own company from a distance—*'looking through a glass'* was the metaphor that many informants used in describing their situation—and acting as strict reviewers of their colleagues' actions and interactions was consistent with the core values of their organizations. At NearBank, employees doubted whether their bank was still a *'big family'* or it was changing into *'a cold organization where nobody looks into your eyes, but only performance matters'* (HR manager). A consultant confirmed

that the new practices frightened many employees, because they perceived the risk of losing *'the sense of familiarity and trust that had characterized the bank'*.

Rejection of practices. Exposed to the indeterminateness of organizational identity, managers and employees started considering the practices concerning the project work proposed by consultants as just *'a mere exercise in style'* (an employee of NearBank). The careful set-up of meetings, the preparation of well-structured documents, and the assignment of detailed agendas were no longer interpreted as a means to better structure the project work, as it had been at the beginning, but as a distraction from addressing the core question of who the companies were becoming. For instance, at ExpressCoffee, while consultants based their evaluation of the offshoring of a product line on cost analysis only, managers noted that it would be unreasonable to even fill in the documents required by consultants without converging on what it means for ExpressCoffee to be an Italian company. The difficulties faced by consultants in the three projects revealed that some of their practices and repertoire of knowledge—methods, tools, cases, and experience—were perceived as not addressing the indeterminateness of the organizational values and therefore rejected

Emerging liminality. Experiencing the refusal of practices from their clients, consultants started feeling unable to guide them. Consultants' emerging condition as liminars is well expressed by the metaphor that CarDesign consultants mentioned: they described themselves as driving one of CarDesign's sports cars in the midst of a foggy day without lights on and feeling that *'you do not know where you are headed for'* (ExpressCoffee consultant). Consultants' initial self-definitions as *'first aid'*, *'coaches'* or even *'generals'*, were substituted with the expression *'team mates'* in their accounts. The perception of fuzziness shared by consultants as well as by the clients' employees and managers who worked with them put at stake the project completion. Liminars could not avail themselves of an organizational reference to look at nor of shared practices to enact: *'impasse'*, *'stalemate'*, and *'dead end'* were the expressions used by our informants to voice the feeling of not being able to achieve the project objectives.

Construction of practices. To overcome the impasse, consultants, managers, and employees developed dual practices to work with their counterparts. On one side, consultants decided to involve managers and employees in consulting-like activities, organized at their headquarters. They were asked to *'think out of the box'*, implying that they had to work on cases specifically designed for learning. For instance, at NearBank a hackathon was organized with different teams trying to solve a business case in 24 hours. As explained by a consultant below, the purpose of this initiative was to attenuate the emotions connected to working on their own settings and become able to look at stakeholders' requests. Similarly, clients' managers and employees resorted to some practices to make consultants aware of their company histories, with the aim of making them *'guardians of our heritage'* (CarDesign CEO).

Consultants were invited to take part in activities necessary to grasp the meaning of work in the three companies. For instance, at ExpressCoffee, they participated in the study of the sound of a new coffee machine in the futuristic sound chamber.

Shared liminality identity. Thanks to the dual practices that brought consultants and clients' members closer within a space that was felt as *'neither our usual workplace nor theirs'* (NearBank employee), consultants and their clients' collaborators could build a shared identity that helped them conceptualize their liminality experience. In all cases, dual practices were acknowledged as having *'filled a void by getting to know each other better and laying the premises for a joint pathway'* (NearBank employee). Consultants and client employees referred to each other as being *'filters'*, *'mediators'* and *'interpreters'*. Being liminal meant looking at the world outside, taking up the challenges that it offered, but also introducing changes coherent with the organizations' history.

Construction of practices. Convergence on the liminal identity of being filters advanced collaboration between consultants and clients' members towards the creation of further practices. A straightforward enactment of the emergent liminality identity was the effort, acknowledged by CarDesign CEO, to *'cast a glance outside, without overlooking what we have inside'* through the elaboration of images (Gioia et al., 2014). Consultants, owing to their expertise, started with collecting information from different sources, such as clients, local communities, unions and institutions. Managers and employees then collaborated with consultants to frame the information into hints for organizational identity attributes. Since images were often scattered, i.e. discrepant and somewhat contrasting across stakeholders (Rindova, 1999), liminars would reflect on which stakeholders' expectations and desires had to be taken into account, which would better be dismissed and which should be left ambiguous, thus paving the way for later discussion by wider organizational audiences. For instance, at ExpressCoffee, attributes of solidity and reliability had been always coupled with the Italian mindset of the company. Nevertheless, images showed that clients expected the organization to be a prestigious worldwide Italian coffee-machine maker, while, for local institutions, having an Italian mindset implied *'being an actor rooted in the Italian economic system, with the main engineering and production facilities located in the historical plant'* (from a local newspaper). Scattered images helped liminars envision the opportunity to make ExpressCoffee more flexible and dynamic by retaining an ambiguous meaning for the expression 'Italian mindset': *'Who they could become is a company with an Italian mindset in the sense of innovation and design, but spread across the globe. Let's say, an Italian mind, but not necessarily an Italian body'* (project manager).

Embracement of images. Liminars triggered and stimulated a debate on who the organizations could become based on the images that they had built and the direction that they had traced. A series of formal meetings with top managers were first organized to present the images elaborated for the companies, and then reflection on possible organizational identity changes extended to a wider

audience, mostly informally at this time. In doing so, liminars provided cues to convey the message that they were acting cohesively and that, being neither internal nor external, but 'something else', their suggestions should not be 'associated with a party or another, but discussed without prejudices' (CarDesign consultant). CarDesign and ExpressCoffee CEOs recognized that liminars' proposals based on images were perceived at this stage as '*stimulating*' and '*engaging*', and that they raised '*a lot of interest, few conflicts*'. Communication was carefully gauged to sustain a constructive debate on organizational identity, as NearBank Organization Office manager recalls below:

We would signal who we are by opening any meetings with the projection of a slide: we thought that a standardized clipart would not fit us, so we created a picture featuring a tangle of bright strings crossing a dark space to convey the message that our ideas could be like flashes enlightening organizations.

Images from different stakeholders addressed attributes of organizational identity that had become confused after the introduction of routines. For instance, at ExpressCoffee, the internal discussion focused on the attribute of 'Italian mindset', which had conflicting meanings for clients and local institutions. Whether ExpressCoffee should be a 'herald of Italianness in the world' (as a client had put it), but not necessarily handling its activities in Italy, or a truly Italian manufacturing company, remained to be clarified. ExpressCoffee informants, recalling the 'ceaseless discussions' at that time, emphasized that they preferred to revamp the idea that being solid and reliable be linked to running their range of activities in Italy. This latter feature resonates with the choice to keep the headquarters located in the town where the company has its roots, instead of reducing costs by moving abroad. As a consultant told us: '*It might sound unreasonable and economically irrational to many, but it's the only thing to do once you realize what ExpressCoffee really wants to be.*'

Images allowed consultants, managers and employees to become aware of new features desired by stakeholders, ultimately leading to the assimilation of some attributes into the organizational identity.

DISCUSSIONS AND CONCLUSION

Our grounded model accounts for the process of organizational identity change when liminality is present. The emergence of a perception of liminality in consultants as well as in clients' managers and employees is intertwined with the construction, denial, and reconstruction of practices, and with sensemaking about organizational identity. Practices can hardly be confined to a defined time and space: more likely, they call into question and induce puzzlement about the core and distinctive characteristics of an organization and about who individuals (consultants, client companies' managers and employees) are in the workplace. The practices introduced by consultants are in our cases perceived as destabilizing the client organizations' identities and entail a feeling of liminality in clients' members. These practices are then questioned and refused, thus triggering a loss of meaningfulness on

consultants' side. At the same time, practices enable a redefinition of the organization and of the self-definition. To overcome an impasse in organizational action, liminars in fact resort to practices that bring them close to each other and trigger a shared reflection on what being liminal is about. Internalizing a common belief on liminality as being on the verge of organizations leads liminars to stimulate a process of organizational identity change. To do so, they harness the practice of image elaboration: they grasp the heterogeneous preferences and expectations of various stakeholders.

This study informs our understanding of how liminality promotes reflection on organizational identity. We believe that the comprehension of this relationship expands on our knowledge of the agency of organizational identity change as well as of the nature of liminality.

Research on organizational identity change processes has privileged a distinction between insiders and outsiders. Organizational identity construction and reconstruction are usually prompted and driven by top management, and only later do they involve lower-level employees to build a shared consensus and make changes more effective (Gioia et al., 2014; Hatch et al., 2015). The main agents of organizational identity change processes are therefore insiders who are formally in charge of organizational changes (Abdel Aziz and Rizkallah, 2015). Outsiders can indirectly affect organizational identity through their preferences and expectations, which insiders elaborate into images (Gioia et al., 2014). Alternatively, outsiders like consultants can provide input for change that is subsequently developed by insiders (Howard-Grenville et al., 2011).

In contrast with this view, we argue that liminal actors, who have 'one foot in, one foot out', are able to drive organizational identity change beyond any initial design or intention. The process that leads liminal actors to influence organizational identity change processes is demanding, though, and resonates with identity loss and restoration paths (Conroy and O'Leary-Kelly, 2014) that see liminal and organizational identities intertwined through practices. New or revised practices may spark organizational identity ambiguity, i.e. 'a sense of unformulated or nebulous identity' (Corley and Gioia, 2004, p. 200) and stimulate a perception of liminality in different actors. Faced with the inability to proceed with their tasks in the wake of a nebulous organizational identity, liminars need to clarify who they are. Restoring identity requires that an answer be provided to the question 'Who are we as liminars?' first. In line with our knowledge about nested identities in fact, individuals feel the urge to clarify their proximal identities (liminal identity in this case) before dealing with more distal targets like organizational identity (Ashforth et al., 2008). Converging on the meaning of being liminal across different experiences and perspectives of liminality—those of organizational members and of their provisional partners—however, is not devoid of difficulties: it still requires an interplay between definitions and practices. Practices represent therefore the common thread linking identity to liminality (Concannon and Nordberg, 2018): through what we have identified as separation and dual practices,

individuals first experience a sense of detachment from who they used to be and a puzzlement about who they are, and later embrace a sense of liminality as 'being filters. The metaphor of the filter as 'something else' replaces the sensation of being 'between and betwixt' (Turner, 1967).

Additionally, a shared liminality identity appears to be necessary to ensure concerted action by liminars of different nature like consultants and client company's managers and employees. In an age in which multiple opportunities for liminality, such as temporary workers, consultants, interim managers, customers, and trainees, are likely to develop simultaneously within the same organization (e.g., Borg and Soderlund, 2015), grasping how a common liminality identity can be built and be interconnected with processes of organizational change through practice promotes a new vision of liminality in organization studies in which also group dynamics are taken into account (Ryan, 2019). Converging on a shared identity as liminars in fact represents a guidepost to see who the organization could become through another practice, that of the elaboration of images (Gioia et al., 2014), and ultimately inspire organizational identity change. The capability of imaging pathways for organizational identity change embodies the creativity to which liminality has been traditionally associated (e.g., Howard-Grenville et al., 2011).

Finally, and remarkably, we claim that our study contrasts the prevailing perspective on liminality in management studies that deems it as being structural in nature. Extant research has in fact ascribed liminality to specific work conditions, e.g., being a temporary worker (Garsten, 1999). Consultants and client companies' regular workers construct and negotiate a shared identity as liminars. A developmental stance on liminality thus overcomes a static view of the activities and patterns of interaction of liminars, who do not interpret their work the same way across different engagements, as argued by Soderlund and Borg (2018), but can change their perspective and related behaviors within the same engagement as practices are introduced, rejected, modified, and reconstructed. The evolution of liminality promotes the idea that it can be a dynamic process through which the perception of the core characteristics of this experience, such as the *communitas* that is formed among individuals who handle a similar situation and the identity work that they engage in, are subject to a transformation without a clear endpoint to tend to (Brown, Huszar, and Chapman, 2017).

Overall, our work shows how liminal actors can contribute to inspire changes in the core features of organizations that have been largely neglected so far. The blurring of organizational boundaries that liminality increasingly entails appears therefore to open a stimulating perspective to our understanding of how organizational change processes unfold.

KNOWLEDGE FROM CUSTOMERS: A SYSTEMATIC LITERATURE REVIEW

Tomczyk, Przemysław

Department of Marketing, Kozminski University, Warsaw, Poland

ABSTRACT

Knowledge from customer is an important source of value because firms use such knowledge to make marketing decisions and maintain dialogue with customers. The literature has not sufficiently investigated the role of knowledge from customer in customer relationship management theory, which has resulted in its limited analysis and understanding. This study provides a comprehensive definition classifying this knowledge into *I know*, *I can*, and *I create*, which reflects customers' passive knowledge, active knowledge, and creative potential. Furthermore, it analyses this knowledge as subjective and objective (*I know*, *I can*) or ideation, design, development, testing, manufacturing, marketing or sales part (*I create*). The findings allow theoreticians to start working on knowledge from customers' measures and examine relationships with other customer metrics to identify the contribution of this knowledge to customer value practitioners can use to cluster their customers and better address their marketing effort.

Keywords: customer knowledge, knowledge from customers, customer engagement value, systematic literature review, customer relationship management

1. INTRODUCTION

Customers provide different types of value to a firm. They pay for products or services, they recommend, they share their experiences with friends, and they provide knowledge. The total value a customer brings to a firm is Customer Engagement Value (CEV). Elements of CEV are Customer Lifetime Value (CLV), when customers pay; Customer Referral Value (CRV), when a customer recommends; and Customer Influence Value (CIV), when a customer shares his/her experiences (Kumar et al., 2010). While these three components have been examined extensively in the literature in recent years, there is also a fourth one, Customer Knowledge Value (CKV), which interestingly, has received no such attention. Understanding of, and insight into, customer knowledge is essential in the process of identifying and analyzing CKV. This study provides that insight and starts with an analysis of the data-information-knowledge hierarchy.

Data are symbols that represent the properties of objects and events (Ackoff, 1999). They are raw material in the process of creating information. Information consists of processed data, which is contextually understood. Like data, information also represents the properties of objects and events, but does so more compactly and usefully than data (Ackoff, 1999).

Based on Davenport and Prusak¹, *knowledge is a fluid mix of framed experience, value, contextual information, and expert insight that provides a framework for evaluating and incorporating new experiences and information*. Knowledge exists within people and is a mixture of various elements (Davenport & Prusak, 1998).

Customer knowledge is an ambiguous term. It consists of knowledge *about, for and from* customers. Knowledge *about* customer (CK(about)) is knowledge a firm holds and can use for its marketing purposes. Knowledge *for* customers (CK(for)) is the knowledge a firm holds and can transfer to its customers, who treat such knowledge as a value. Knowledge *from* customers (CK(from)) is understood as the knowledge residing in customers, which can be valuable for a firm's marketing purposes (Gebert, Geib, Kolbe, & Brenner, 2003). When discussing customer knowledge or CKV, the study understands knowledge from customers as an actual or potential resource which a customer contributes to a firm. A variety of concepts describe different aspects of the CK(from) phenomenon from different angles (Gibbert, Leibold, & Probst, 2002) but none concentrate on CK(from) more than putting this into the context of knowledge *for* and *about* ones. The authors of the articles implicitly assume CK(from) is well known and do not define it in detail.

However, in order to properly assess CKV an in-depth study of CK(from) is first required. To meet this requirement, this paper proposes to 1) define CK(from), 2) classify CK(from) and provide directions for future CK(from) research. Furthermore, the paper provides benefits both for theoreticians and practitioners.

There are significant benefits for theoreticians arising from this study. Defining and classifying CK(from), the study provides a foundation on which to start working on CK(from), which is relevant and unestimated as a source of CEV. Different customer valuation models include this, but don't operationalize it (H. H. ; Bauer & Hammerschmidt, n.d.; H. H. Bauer & Hammerschmidt, 2003; Tomczyk, 2015; Tomczyk, Doligalski, & Zaborek, 2016). Operationalization allows to measure and study CK(from) in a way that is similar to monetary or referral value (CLV or CRV), which can pave the way for a wide research trend similar to that of CLV in the early 2000s. Firms don't usually gather CK(from) data, so they might be interested in helping researchers gather this data. The above could help researchers find research partners, whom they can help and who can help them complete their studies.

CK(from) research could contribute significantly to CRM practitioners. Based on the results of CK(from) research, CRM managers and specialists will be able to measure and manage CK(from), which will allow them to evaluate and segment customers in a way they have not done before. Measuring and managing CK(from) value (CKV) will enable them to propose different marketing strategies. Moreover, identifying the link between CK(from) or CKV and other CRM metrics such as CLV, CRV, CIV, customer profitability, NPS etc., will let them allocate marketing resources to maximize customers' return rate. If CK(from) does affect CLV or NPS, this will shed light on how to manage customers to maximize CLV in a new way by supporting CK(from).

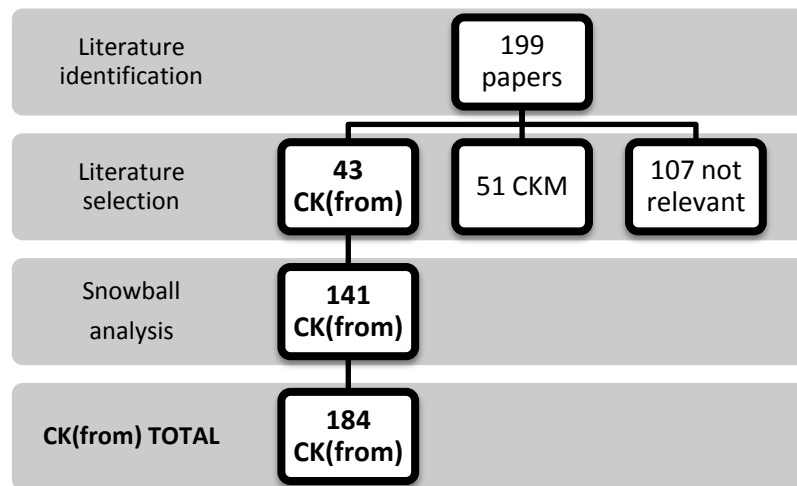

2. METHOD

To achieve its goals, this study used the Systematic Literature Review (SLR) methodology in the theoretical scheme version of Tranfield, Denyer, and Smart (2003), and its practical implementation by Crossan and Apaydin (2010). This allowed the author to provide highly reliable and comprehensive evidence based on the topic. The paper concentrates on CK(from) aspects independently from the theoretical concepts that are behind the particular analyzed article. This is to avoid the risk of ambiguity regarding these concepts. Concentrating on the CK(from) idea without its different conceptual connotations allows for the extraction of the essence of the phenomenon.

Applying Tranfield et al.'s SLR model in the implemented version of Crossan and Apaydin allowed this study to include a three-stage procedure: planning, execution, and reporting. The **planning stage** defined the objectives of the research and the source of the data. The goal identified at the **planning stage** is twofold – to to define CK(from), and to classify it. To achieve that goal, the paper focused on an analysis of English publications included in the EBSCO, Proquest, Emerald, ScienceDirect, and JSTOR databases. The study was up to date as of March 2017, so the papers included were published until that date.

The **execution stage** identified the base literature with the keywords, and the second layer of the group of papers using the snowball method based on references analysis. The execution stage started with papers from the literature identification, literature selection and snowball analysis to identify the number of relevant papers. Figure 1 presents the results of the process.

Figure 1: Identification of number of CK(from) papers

First, the article conducted literature identification. The collection includes data using peer-reviewed academic journal full papers, driven by the following keywords: *customer knowledge*, *customer knowledge management*, and *customer knowledge value* in the title, abstract, or keywords². The research resulted in an initial sample of 199 articles. The sample set was then fixed as the basis for all future analysis.

Secondly, the literature selection phase resulted in three groups of articles. The detailed analysis of the set showed that 107 of them referred to other topics only, with small parts devoted to broadly understood customer knowledge, so they were considered irrelevant. Fifty-one of the articles are general customer knowledge ones or refer to knowledge *for* or *about* customers. Forty-three papers were concerned strictly with the CK(from) area.

Third, the research conducted a snowball analysis to complete the set. CK(from)'s articles references analysis identified a further 141 papers relevant to the topic, so finally the research discovered 184 papers which concentrate on CK(from).

At the **reporting stage**, the paper went through content analysis to propose CK(from)'s definition and classification, which allowed for the achievement of the first and second goals of the study.

3. RESULTS

At the **reporting stage**, the content analysis shows the results of in-depth studies to find the definition and classification of CK(from). Firstly, the study proposes a CK(from) definition and general segmentation based on all the papers' analysis (184 CK(from) + 51 general CKM ones).

Subsequently, the study classifies different types of CK(from), based on the criterion of CK(from) characteristics, which is suitable for all possible knowledge manifestations. To achieve this goal, the paper selected 136 empirical articles out of 184 initially identified, and excluded 24 that did

not have appropriate content (i.e., not regarding the creation of value for a firm; e.g., user entrepreneurship). Consequently, the paper moved forward with 112 empirical articles.

The literature suggests that all CK(from) manifestations can be perceived in three ways: First, customers get to know the offer, brand, or product category from a variety of knowledge sources, e.g., customers know about different smartphone models to buy the most appropriate one. The current study calls this the *I know* type of knowledge, which is **passive**. Secondly, customers can use the offer, e.g., withdraw money from an ATM. The study calls this the *I can* type, which is **active**, since customers have skills in how to do something. Thirdly, customers participate in offer creation/modification based on their preferences and participate in the new offer creation/modification process. The study calls this the *I create* type, which is **creative**, since customers create or participate in the creation/modification process. The first two elements are positive, while the third is normative, because it expresses preferences for what the offer should look like.

Regarding the CK(from) the manifestations above, the paper proposes the designing definition of CK(from) *sensu largo*:

Knowledge from the customer is what the customer knows (*I know*), can do (*I can*), and what the customer can create (*I create*), what a firm can identify, and how this can apply to an organization's purposes.

Widely understood, CK(from) conceptually implies a comprehensive foundations to capture all the knowledge from customers value which is possible to identify, with no limitations to one or two its types, like customer feedback or suggestions. From a logical point of view, this definition is synthetic and nominal, which means it is a second-level statement in which CK(from) is defined by its types and attributes (Fetzer, Shatz, & Schlesinger 2012) where each can be extended and described. All the CK(from) types (*I know*, *I can*, *I create*) can be managed according to the knowledge management model, i.e., this knowledge can be created, stored, shared and applied (Leidner, 2000) and it is the knowledge the firm can get or already has.

While customers possess all these three CK(from) types, firms can manage the first two as knowledge about the customer and the third as knowledge from the customer. In the first case, the firm's resource is to know what customers know or can do, and in the second – the customer's knowledge, skills, and opinions/suggestions, which are the firm's resources that reside in the customers' minds. This clearly distinguishes CK(from) types in terms of the way they can be managed.

The definition is of a designing character, because it changes the classic meaning of CK(from) based on the *I know* type (Gebert et al., 2003), and expands it by the *I can* and *I create* components. The classification behind the proposed definition is based on customers' attitude to the offer. *I know*

implies passive knowledge, considering what the customer knows about the offer (e.g., the customer knows the price, knows where to buy, knows the competitors, knows the industry jargon, etc.). Both the next elements are active, where *I can* implies customers' skills of using the offer (e.g., can drive a car, can handle a smartphone, etc.) and *I create* – the ability to create or modify it (e.g., to propose a new ice cream taste, designing and testing it, etc.).

The content analysis of the articles that fall into the three above-mentioned categories shows that the three CK(from) types can be subdivided into specified subcategories, presented in Table 1.

Table 1: CK(from) subdivision criteria

CK(from)	CK(from) Categories	CK(from) Subcategories	Theoretical Justification
Knowledge from Customer (CK(from))	I know	objective	Customers' knowledge is verified by external means
		subjective	Customers' knowledge is not verified by external means
	I can	objective	Customers' knowledge is verified by external means
		subjective	Customers' knowledge is not verified by external means
	I create based on New Product Development process (Lagrosen, 2005)	ideation	Customers give ideas for new product/service
		design	Customers participate in designing new product/service
		develop	Customers participate in modifying product/service
		test	Customers test new product/service
		manufacturing	Customers participate in producing product/service
		marketing	Customers participate in product/service marketing
sales	Customers participate in product/service selling		

Objective and subjective knowledge division is the most intuitive and clear means of identifying one of the attributes among the papers on *I know* and *I can* knowledge. Subjective means what people think they know (*I know*) or are able to do (*I can*), which is the opposite of whether they really know or are able to do. Consequently, objective knowledge is verified while subjective knowledge is not (Brucks, 1985).

Regarding the *I create* field, New Product/Service Development (NPD/NSD) theory states that customers can participate in product or service creation at different stages. In looking for operationalization, it was sufficient to find an extended classification to cover all possible forms of collaboration. The paper uses Lagrosen's stages of the New Product Development process, which consist of the idea stage, the development stage, and the launch stage (Lagrosen, 2005). Expanding these three general stages with detailed activities such as strategic planning, idea generation, idea screening, business analysis, forming cross-functional teams, designing, personal training, service

testing, pilot running, test marketing, and commercialization (Alam, 2002), the paper comes up with the seven listed in Table 3. These are of linear logic but could be independent from each other, i.e., the customer can test a product/service without ideating or designing it. The subdivision criteria reflect features that are common for all knowledge manifestations among the identified papers, and general enough to cover most of the papers. This means that CK(from) described in the articles analysed falls into at least one of these subcategories. Only eight out of 112 empirical papers were removed because they cannot be subdivided since they don't contain sufficient information to make this subdivision. Finally, the study moved forward with 104 empirical papers for the subdivision. Table 4 presents the number of papers concerning each category.

Table 2: Number of papers in each category

Criteria	CK(from) Type	No of Papers	Fraction of Papers
No of CK(from) types in a paper	single CK(from)	83	79.81%
	double CK(from)	20	19.23%
	triple CK(from)	1	.96%
No of papers for particular CK(from) type	I know	13	12.50%
	I can	25	24.04%
	I create	88	84.62%

Notes: e.g., *Single CK(from) 83* and *double CK(from) 20* means there are 83 papers with one CK(from) category used and 20 with two categories used.

The number of all the articles covering at least one type of CK(from) equals 104, where 83 articles include only one type of knowledge, 20 include 2, and 1 includes 3. Single CK(from) articles explicitly dominate, representing 79.81% of the relevant category.

84.62% of the articles relate to *I create* knowledge. This means that the most often analysed CK(from) aspect is the *I create* one. This accords with the well-grounded NPD/NSD theory, which allows for customer participation research studies to be conducted in a formalized way. *I know* and *I can* have been recently identified with no such grounded theory. The results don't add up to 100%, because one article may cover more than one CK(from) type.

The study provided the insight into particular CK(from) subcategories. The analysis entails two assumptions. First, knowledge from each type of CK(from) types presented below can be transferred as information from the customer to the firm, so the knowledge is explicit. The information is therefore the content of the transmission of knowledge, which allows firms to know what others know and, based on this, to build their own knowledge. Second, the analysis requires the offer definition. Offer is the whole value composition and comprises the value of the product, price, communication, distribution, people, physical evidence, and process. It is important since the study

interprets the whole NPD/NSD process broadly, like all marketing-mix elements. This allows us to treat marketing communication customers' contribution, for example, as *I create* knowledge.

3.1. "I Know" Objective

Objective knowledge refers to what an individual actually knows (Brucks, 1985). This knowledge is understood as an individual's actual knowledge about reality, especially the offer, market, or industry. It refers to accurate stored information and depends on ability or expertise. Objective knowledge can be assessed with the reference point stating whether it's true or not. Objective knowledge considers that someone actually knows (Lee, 2015) and can be measured by some sort of test (Vigar-Ellis, Pitt, & Berthon, 2015), tasks to do (Brucks, 1985), or questionnaires (Lee, 2015).

This type fits the industries in which knowledge allows customers to consume the offer, e.g., if a customer is not a wine connoisseur, he won't appreciate the complexity of the wine's flavors; when a female customer does not know the expected make-up effects, she won't be able to make a good choice – that the product is objectively good (or not) for her skin. The important thing is that such judgments require advanced and specific knowledge, which is not a part purchases that require less engagement, such as ice-creams, where the customer does not have to know how to buy an appropriate ice-cream and appreciate its taste.

3.2. "I Know" Subjective

Subjective knowledge is an individual perception of, or confidence in, how much a person knows about the reality, especially the offer, the market, or the industry. Subjective knowledge refers to how much people think they know (Vigar-Ellis et al., 2015). Subjective knowledge differs from objective knowledge since people are over- or under-confident about their actual knowledge level (Brucks, 1985). Subjective knowledge is based on expertise, experience, and other factors. It has typically been measured by subjects' self-reports of their knowledge of a product category or domain or questionnaires (Lee, 2015). Subjective knowledge is based on customers' conviction (Basu & Vitharana, 2009). When purchasing any product, customers often rely on personal memory/knowledge to make their decision (Shafiq, Raza, & Zia-ur-Rehman, 2011).

Subjective knowledge allows customers to make decisions that might not always be right, but are usually perceived as right. This applies to industries in which customers are relatively free to create the aesthetics of the environment and where knowledge does not need to be verified by external means.

3.3. "I Can" Objective

Objective knowledge is an individual's actual level of skills of how to use an offer or how to do things related to the industry, verified by external means. Customers can verify their knowledge on how to use via technical forums and chats, where they can talk with other potential or current

customers (Sawhney, Verona, & Prandelli, 2005) or product users in mutual discussions of user-related issues (Jeppesen & Molin, 2003) or meetings with customers to evaluate progress and confirm direction (Abrell, Pihlajamaa, Kanto, vom Brocke, & Uebernickel, 2015). Some customers are expert buyers, who can sort through the offered product-attribute space easily are more capable of analyzing information (Alba & Hutchinson, 1987) and can more easily choose product configurations that best meet their needs (Ghosh, Dutta, & Stremersch, 2006).

Customer-engaged and co-creation forms need customer skills. The car industry, electronics, or home facilities industries require customer skills on how to use particular appliances. This allows them to use the appliances correctly and helps to avoid the risk of damaging the items, being hurt, or using them inappropriately.

3.4. "I Can" Subjective

In this case, the ability to use a product/service is not verified by external means. It concerns the subjective level of the ability to use a product or service or related industry skills (e.g., skills to follow and understand stock quotes). The conviction that customers can do something, appears especially when they are passive and use the product alone without communicating with others about the product (Jeppesen & Molin, 2003). When purchasing any product, customers often rely on personal memory/knowledge to make the decision (Shafiq et al., 2011). Customer self-consciousness, even if it is untrue, can result in a modification of the customer's or other customers' attitude. By decorating and combining furniture properly, showing the furniture to guests, and using the furniture, the customer is also creating value (value-in-use) (Andreu, Sanchez, & Mele, 2010).

Even if the knowledge has not been verified, customers can inform the company and other customers about their problems with products, services, and service delivery in a customer community forum, which companies can use to look specifically for problems to which customers cannot find a solution (Blazevic & Lievens, 2008). Even not well educated but highly convincing people help others by promptly answering their product-related problems (Nambisan & Baron, 2009).

Customers tend to be convinced that they can do something, when actually they cannot. The above states that this results in higher willingness to modify the offer or share knowledge. So, negative knowledge verification may result in a lower tendency to purchase.

3.5. "I Create"

I know is passive and is related to knowledge about the offer, competition, industry, and related phenomena (such as trends and lifestyles). *I can* is active and relates to skills of how to use the offer or how to do things related to the industry. This means customers use the product or service, but do not modify the offer. *I create* means customers participate in the process of new/modified offer creation, so

what they know, how they can use, and what they think about it can be utilized to create/modify a new offer.

Customers' reflections lead to ideas relating to new offer creation or modification. Customers can integrate with different product/service development stages, starting from idea generation, concept, and prototype development, marketing, and launch, up to the modification and improvement of existing products (Füller, Faullant, & Matzler, 2010) or idea generation, concept refinement, product development, and product testing (Troy, Szymanski, & Varadarajan, 2001). Some authors define creation engagement as customer involvement (CI) and define it as the customer's direct participation in the design and development stages of NPD, in which the customer engages in problem-solving activities and co-develops the final forms of the product with the manufacturers (Feng, Sun, & Zhang, 2010; Brown & Eisenhardt, 1995). This involves joint product design, process engineering, and production operations with key customers. Other authors define it as customer knowledge development (CKD), which is an iterative process of developing an understanding of customer preferences via stages such as idea generation, concept refinement, product development, and product testing (Joshi & Sharma, 2004; Troy, Szymanski & Varadarian 2001).

Customers' opinions, likes, and dislikes help to improve the business's offerings to attract and retain customers (Kumar, 2013). Customers express their ideas in the form of different activities, from less engaged activities (ideation and feedback), through designing, offer development, testing, manufacturing, marketing, and sales. The seven steps mentioned above are NPD/NSD process components and are used in the paper as a framework for *I create* knowledge characteristics. They are disjunctive, which means a customer can be a designer but not necessarily an ideator. This results in the customer's participation level, which depends on how many stages the customer participates in.

3.5.1. *Ideation*

Ideation is about generating ideas for the firm. Some customers prefer to generate new ideas, while others like to evaluate and further modify existing ones (Füller, 2010). Customers can bring ideas to modify a current offer or to create a new one; however, the difference between them is not always clear-cut.

People have ideas and want to share them when they can describe needs, problems, and possible solutions; suggest desired features, benefits, and preferences for products and services; identify financial problems not solved by existing services; evaluate existing services by suggesting likes and dislikes; identify gaps in the market; provide a new service wish list (Alam, 2006). People want to introduce ideas to producers (Fuller, 2006) to help them come up with new versions of products or genuinely new products (Jeppesen & Molin, 2003). The scope of forms is wide.

Ideation applies to most industries and concerns most of the marketing mix elements. Customers suggest products or product modifications, distribution modifications, or promotion suggestions. Pricing policy is strictly connected with financial results so such policies are proposed by the firms. In some situations product suggestions are not appropriate either (e.g., the medical industry), since people do not have sufficient knowledge (*I know*) to propose suggestions.

3.5.2. *Design*

Product design is a further step in the *I create* process. It's about visualizing the idea in the form of a visual or conceptual prototype of the product or service. At this stage, customers often provide ideas on how the product or service should look (Eslami & Lakemond 2016). For example, the method of user design allows users to design their own products according to their wants and needs (Fuller & Matzler, 2007). Sometimes, this merely involves modifications of existing products regarding such elements as color, form, and size (Lagrosen, 2005).

Designing requires specific skills and is far rarer than ideation. Actually, this is the first step of physically preparing a new product/service and is performed mostly in house. It is used especially in the case of simple products or services, such as beverages or aesthetic products, either of which is customized.

3.5.3. *Development*

Development refers to the conversion of a new idea and the design concept into a new, physical product or service. The development phase concerns work on the prototype, which leads to the establishment of a pre-test product/service by discussing and improving optional solution details, selecting or individualizing the preferred virtual (Fuller, 2006) or real (Shaw, 1985) prototype. This is done in order to develop new products and services that better meet consumers' wants and needs and to decrease the high failure rates of new product introductions, especially prevalent in the consumer goods sectors (Füller, 2010). Collaboration with customers requires them to play active roles, so passive users or active informers cannot contribute to development. However, bidirectional creators help the development team in various ways, such as validating product architectural choices (Blazevic & Lievens, 2008). Customers also engage as codevelopers in hands-on development and trials through development (Coviello & Joseph, 2012). Developing, disseminating and implementing a unique concept is an essential step in product development (Kohlbacher, 2008). Customers participate in round-table discussions, application labs, and user groups (Gordon, Kaminski, Calantone, & di Benedetto, 1993), and the whole process has an iteration character (Joshi & Sharma, 2004). If a highly innovative product is developed, it involves new engineering and manufacturing knowledge that is inherently ambiguous to the manufacturer, who has no prior experience of it (Lau, 2011).

Development needs highly specialized knowledge and is applied in highly specialized industries. Interestingly, the literature provides examples of customer development, where the product or service is complex. This means there are highly engaged leading customers with highly advanced knowledge. Sometimes they do prototypes for themselves, not for sale, where they overcome the whole creation process (Hyysalo & Usenyuk, 2015).

3.5.4 *Test*

The product/service is tested during or after the development test (see Joshi and Sharma 2004). Based on the nature of development, it is sometimes difficult to distinguish between these two phases. The phase covers testing and experiencing the new product features by running simulations, getting information about the new product, or just consuming it (J. Fuller, 2006). Customers are expert testers, who are typically able to spot errors and mistakes in prototypes during testing (Jeppesen, 2005). Lead users are a group that provides special information and feedback during product testing (Jin & Chih-Yu, 2011). Customers suggest improvements by identifying points of failure in service delivery (Alam, 2006). Together, firms address some problems during system tests. As one of the respondents says, "It was very important for both parties to understand what the issues were. For instance, when we saw the breaking of some of the standard components, we told them, 'Ok let's take out the system and analyze it together. Together with the customer, we examined each of its components and performed in-depth investigations. We chose this approach, as we believed it would help us change their minds regarding our solution'" (Eslami & Lakemond, 2016). The workshops are a form of testing and are usually organized after users have been visited for purposes such as testing new products with them (Abrell et al., 2015). At this stage, the customers are contacted again and asked to give their viewpoints of the prototype (Lagrosen, 2005). Toolkits, as well as workshops, enable a user-only service development and testing process carried out by users in their own user environments at no cost to the service developers (Oliveira & Von Hippel, 2011). The internal, laboratory trials and tests are based on a system of testing versions of the entire product and testing the pre-release versions of the product by end users/customers often at their sites (Callahan & Lasry, 2004). Using that mold, creators-customers built 40 kayaks for their own testing purposes (Hienerth, 2006).

Testing is a phase in which no specific knowledge is required, and sometimes is even undesirable. Software beta testers or clothes testers are ordinary people who represent the target group that consists of usual customers. This allows a company to avoid the effect of customer professionalization, because most of them are not professionals.

3.5.5. *Manufacturing*

Manufacturing is a phase during which a customer participates in the production process. This can be a pilot (Campbell & Cooper, 1999) or regular (Lau, 2011) production. This phase occurs rarely.

Producers manufacture without consumers (think of a firm producing cars), whereas services (such as a haircut or repairing a car) are more popular ...it is often useful to think of services as either intermediation activities, such as transport, that arise because consumers want to separate production and consumption, or contact services, such as haircuts or medical services, where production involves the consumer directly and where the output of the activity is embodied in the consumer. An important aspect of a service is the jointness of production and consumption – i.e., that goods can be produced (Oliveira & Von Hippel, 2011).

Manufacturing requires that the highest competent customers are treated like employees. There is relatively low space for customer interference in different industries. The whole manufacturing process is ordered by a firm's goals with the minimal involvement of the customer's role.

3.5.6. Marketing

Marketing is a phase during which a customer participates in a marketing process, and such participation is understood as being involved in marketing activities (Bonner, Walker, and Jr. 2004) connected with launching a product or service in the market (Carbonell et al. 2009; Füller et al. 2010). This includes the release of the product into the market and the promotion and commencement of sales to customers (Callahan & Lasry, 2004).

Even though there are only a few examples in the literature, it is easy to imagine significant customer engagement in this field. Customers can promote an offer and participate in distribution channels like promoters or ambassadors in different industries, especially when they participate in the whole NPD/NSD process, which authenticates their marketing participation.

3.5.7. Sales

Sales is a phase in which a customer participates in sales activities (Bonner et al., 2004), initially by suggesting rough sales and market size (Alam, 2002; Alam, 2006) and subsequently leading to the commencement of sales to customers (Callahan & Lasry, 2004). This stage analysis resulted in no examples, which means this is very rare in the NPD/NSD process.

Sales allow customers to participate as selling ambassadors in trades and open days. One can imagine that innovative customers can be engaged as sales representatives for a specific period in different industries; however, it seems this is a phase the firm can accomplish itself or it doesn't see the opportunities resulting from this phase. Summing up, the customer's role in this phase is highly limited.

4. CONCLUSIONS

In spite of many marketing and knowledge publications, there is still no clear definition and classification of CK(from), and the current state of CK(from) research is unknown. This is important, since CK(from) can be a source of value for a firm (the same as purchases, recommendations, or social

influence), but actually it is not. Based on the above, the article aimed to 1) to define CK(from), and 2) to classify it.

Based on the literature analysis, the study found that the CK(from) definition covers passive knowledge manifestations, even when the analysis proves the occurrence of active forms, including skills and creative abilities. This leads to the designing definition of CK(from), which covers all the customer knowledge manifestations: passive, active, and creative (*I know, I can, I create*).

The definition leads to a classification from passive knowledge (*I know*) through active, which covers customer skills of how to use the offer (*I can*), to the creative one, regarding new offer proposition and creative process participation (*I create*). More than 84% of papers relate to *I create* knowledge, which reflects the popularity of the NPD/NSD concept in the first decade of the 21st century, where only 24,04% of papers have been related to *I can* and 12,50% to *I know*. This means the research on CK(from) went in the direction of how to use the knowledge rather than what it actually is. The above resulted in no CK(from) definition and classification.

CK(from) needs operationalization. Both *I know* and *I can* may be subjective and objective, which means customers can tell what they think they know or what they think they can do (subjective) or show what they really know or can do (objective). *I create* operationalization is based on the NPD/NSD process, which covers all the possible customer engagement forms from ideation to sales.

Customers could use their knowledge to make better decisions, which would help firms indirectly or collaborate with firms, which would help them directly. The first is *I know* and *I can*, the second is *I create*. Proposing the extended CK(from) definition, the study expands the paradigm of traditional CK(from) understanding. It goes beyond the knowledge *sensu stricto*, which is passive. Including skills and creation ability, the classification allows us to grasp all of the knowledge manifestations together and examine them comprehensively. Moreover, it is possible there are relationships between them. Research studies suggest customers generate useful insights (Smith & Shah, 2013), and information usage improves a firm's performance in business-to-business markets (Rollins, Bellenger, & Johnston, 2012). Customers also design customized products (Randall, Terwiesch, & Ulrich, 2007) and support the innovation process (Lüthje, Herstatt, & Von Hippel, 2005). The above means CK(from) brings value in different forms, but the monetary and relationship value is still ambiguous.

The strength of this paper is that it is the first attempt at SLR in the field of CK(from), proposing a definition and classification based on the wide range of articles across a wide span of time. It helps understand CK(from), and can be a starting point for further research.

The research defines CK(from) and classifies it. This allows academic marketers to start working on the role of CK(from) as a value creator for a firm. This may lead to customer knowledge valuation and complement CEV model hypothesized by V. Kumar in 2010⁹. The model consists of customer lifetime value, customer referral value, customer influence value, and customer knowledge value, where the last element is not examined sufficiently. Treating customer knowledge value as a CEV component may allow us to estimate CEV more accurately than ever and is an opportunity to start a new research trend, as in the case of CLV in the 1990s and early 2000s. If we say customer knowledge value is important, we cannot say, CK(from) is not important.

CK(from) analysis may help for firms to estimate CKV in future and, consequently, to estimate the CEV of their customers correctly. It can protect them against customer undervaluation and lead to more accurate customer segmentation and marketing resource allocation. Furthermore, this may allow for the shaping of individual relationships, not only with the most intellectual contributive customers, who co-create the firm's offer, but also with non-creators, who just know or can do something. The research results may allow us to find CK(from) as a value and customer behavior determinant, answering questions such as: Do customers who know more than others buy more frequently? Do they pay more? Do they pay earlier? Are they more loyal?

A limitation comes from the fact that CK(from) is often regarded in scientific articles as being of secondary importance, and might be difficult to identify. This leads to the risk of avoiding papers that are potentially significant. However, the number of 184 seems to be critical for SLR.

Treating the paper as a basis for further research, the article proposes its procedure. First, CK(from) needs to be operationalized. The most effective way seems to measure subjective knowledge by proposing and verifying scales. Second, the CRM hypotheses allow us to propose the research, which can verify the relationships between CK(from) and CRM metrics such as customer loyalty, satisfaction, and purchase frequency. Third, when the relationships are known, the research can identify CK(from)'s antecedents. Finally, CK(from) should be evaluated, which would allow scholars to identify CKV as the missing element of CEV, as mentioned in the introduction of the paper.

ABSTRACT

The promotion and transition to a circular economy model presupposes the consideration of the activities that support the enterprise's value chain. The organization's internal operations must adopt the circular economy at every step of the value chain, from product development to consumption, repair and reconstruction, disposal potential and secondary raw materials re-entering into the economic cycle. The present-study is a prototype research for the Greek business environment under the context of the Circular Economy model, since the literature on relative empirical studies is rather limited for the country. The main purpose is to map the main procedures, business strategies and measures of the Greek industries for adopting and implementing the circular economy model during the complete life cycle of products. The study is based on primary data from the Greek industry leaders, about the knowledge of the circular economy model, the assessment of the circular economy in the business sector and the practical applications and procedures of the enterprises for the adoption of the model. Results show that there is a lack of an integrated and well-planned approach to fully adopt the model, in relation to the procedures proposed by several researchers in the field. Although the Greek industries of the study recognize the importance of adopting such methods to theory operational framework for entering in new markets, boosting their innovativeness and competitiveness contributing to sustainability, however they mainly remain to recycling procedures of products and materials for reuse purposes.

Keywords: circular economy, product life cycle, innovation, resource efficiency, economic model, Greek industries, sustainable development

1. INTRODUCTION

The current economic model is characterized as linear, where natural resources are originally extracted and used to production process, then products are consumed and finally disposed. After use, the products end up in waste but are still valuable resources. A linear production model reaches rapidly the limits of natural resources availability due to the increased global population and consumption, as well as the finite character of earth's natural resources, (Technopolis group, 2016).

Environmental impacts usually reach quite significant numbers. In the 2013 report, Ellen MacArthur Foundation estimates that in 2010, 65 billion tons of raw materials were imported into the productive economic cycle. This figure is expected to increase to 82 billion tons by 2020. At the end of products' life cycle, the majority (60%) either ends up as waste or is incinerated. Only 40% of the materials are used for recycling or in reuse processes (Ellen MacArthur Foundation, 2015). According to contemporary innovative concepts shaping the present but especially the future of economies, we must consider the transformational shift from an established linear economic model into a circular one as rather obligatory. This transition will only be possible with gradual change over time and an adjustment of the general institutional framework. This implies that all possible conditions in the existing economic models and institutional frameworks are reviewed and adapted to follow the model of a circular economy. These conditions include government actions such as taxation, incentives, procurement, education (awareness raising and skills acquisition), legal framework, finance and funding opportunities, technologies and standards (Technopolis group, 2016). Certifications and labels will also help consumers and business to establish information proposals and related choices for products that are in line with the circular economy model (Technopolis group, 2016). In short, the transition to a circular economy entails a massive change requiring action by all parts of the triangle: institutions, industry and civil society (Ellen MacArthur Foundation, 2013a).

The purpose of the present research is to map the main procedures, business strategies and measures of the Greek industries for adopting and implementing the circular economy model during the whole life cycle of products, under the context of the adoption of a strategic shift and the transition towards the abandonment of linear production model for a more effective, efficient and viable one.

2. BASIC THEORIES AS FOUNDATIONS OF THE CIRCULAR ECONOMY MODEL

The beginning of the concept of circular economy cannot be traced back to a single date or to a single author, but it is derived from different scientific fields and schools of thought. Many researchers believe that the circular economy model was mainly introduced by the environmental economists such as Pearce and Turner, who built their theoretical framework based on previous studies by the economist Kenneth Boulding (Andersen, 2006; Heshmati, 2015; Murray, et al., 2017; Wautelet, 2018). However, those are not the founders of the concept. According to Murray, et al. (2017), the extensive literature review of the last two decades has shown that, the circular economy derives mainly from ecological and environmental economy as well as from industrial ecology.

According to Ellen MacArthur Foundation (2012, 2013a, 2013b), there are recent theories that improve and develop the circular economy concept. These theories pertain to (Ellen MacArthur

Foundation, 2012):

- *Industrial Ecology*: The concept of circular economy origins in industrial ecology (Preston, 2012; Murray, et al. 2017).
- *Cradle to Cradle*: The "cradle to cradle" notion, which focuses on a new way of products designing, goes beyond the concept of eco-efficiency and minimizes the negative impact of businesses on the environment (McDonough & Braungart, 2002).
- *Performance economy*: a Swiss architect and industrial analyst, Walter Stahel, developed a "closed loop" model that aims at the waste prevention during the production process and at closing the open linear flows. A closed loop economy is often used as a synonym for a performance economy. Stahel (2010), refers to the circular economy by using the term "lake economy", through which reprocessing of goods and materials generates multiple benefits (Comment, 2016; Clift & Druckman, 2016).
- *Biomimicry*: studies nature, trying to identify the best techniques and then imitates her designs and processes for adapting them in provision of innovative and sustainable solutions for the society. Using this methodology, it can help companies to create innovative technologies, industrial processes and systems, which are more energy and material efficient, while they are saving money and helping them being more resilient and competitive.

3. DEFINITIONS OF CIRCULAR ECONOMY

Several authors (Andersen, 2006; Su, et al., 2013; Geissdoerfer, et al., 2016; Trigkas, et al., 2018) attribute the concept of circular economy to Pearce and Turner (1989), while this concept gained momentum in the late 1970s (MacArthur Foundation, 2013b). In recent years, there has been increased interest on academic research, with a marked increase in publishing in the sector in 2015 (Lieder & Rashid, 2016). The origin of the concept comes from Germany and Japan, where there was pressure to form a more closed loop society (Lieder & Rashid, 2016). The country that has fully adopted the implement and development of the concepts of the cyclical economy is China (Zhou, et al., 2014; Ghisellini, et al., 2016).

With increasing pressures on natural resources, the notion of more efficient use of materials and resources has become an overriding issue around the world through the transition to a more beneficial economy where the value of products, materials and resources is maintained in the economy as much as possible and the generation of waste is minimized. This is an essential contribution to the development of a sustainable, competitive economy (Trigkas, et al., 2018).

The most well-defined definition has been formulated by the Ellen MacArthur Foundation (2012), defining the circular economy as "*an economy that promotes systemic change and creates continuous circles*

of materials: resources are only a temporary part of a product and at the end of life or end of use of the product, resources will be available again for reuse in new products". The principles of the circular economy, as suggested by Ellen MacArthur Foundation (2013), include that the circular economy is a global economic model that decouples economy growth from consumption of finite resources. It distinguishes and separates the materials of technical and biological origin, seeks to preserve at the highest possible value throughout their life. It focuses on the efficient design of processes and the resources efficiency to optimize flows and to maintain the physical and technical reserve resources. It provides new possibilities for innovative solutions in fields such as product design, services and business models, food production, crops, etc. Finally, it creates a framework and builds the foundation for a durable system capable of functioning in perpetuity.

In the circular economy, redesigning of products increases the value of used resources to decouple economic growth from resource use. As a result, opportunities have been created to extend the life cycle of the product (Mavroudis, 2018). Circular economy is briefly described as a "4R" approach: reduction, reuse, recycle and recover. Through this process the amount of waste minimized and managed more efficiently. As a result, solving multiple environmental problems whilst preserving natural resources. However, problems are also encountered in this process, such as financing, consumer behavior, business models, government etc. (Tukker, 2015; Ghisellini, et al., 2016; Trigkas, et al., 2018).

4. IMPLEMENTATION OF CIRCULAR ECONOMY IN THE PRODUCT LIFE CYCLE

According to the European Commission (2015, 2017), for the promotion and transition to a circular economy, we need to consider all the activities that support the enterprise's value chain. An organization's internal operations must adopt the circular economy at every step of the chain, from generation of product to consumption, repair and reconstruction, waste management and secondary raw materials re-entering into the economic cycle (Karagouni, 2018).

The supply of raw materials, resource consumption and waste production throughout the life of the product are influenced by both design and production methods. With proper product design, their quality can be improved, facilitated, repaired, refurbished and rebuilt. They can also help save valuable resources through recycling, while protecting the single market and competition and fostering innovation. The first European Commission action proposed in the Member States was eco-design for safer dismantling, reuse and recycling of products.

The production method is an important stage in the circular economy. Even if the necessary design processes are done properly, without the efficient exploitation of natural resources in production

methods, we can end up with negative results, such as lost business opportunities and the production of a significant amount of waste. It is also important to promote innovative industrial processes on waste and by-products utilization to facilitate industrial co-existence across the EU, known as industrial symbiosis.

Consumers as well, play an important role in the circular economy, either with a positive or negative impact. These options are shaped by the information that consumers have access to, the variety and prices of available products, and the regulatory framework. Consumers are often confronted with a multitude of brands and environmental claims, making it difficult to distinguish differences between products. Actions on clear and reliable labeling, improved recovery, product upgrading, and durability are an important part. The life cycle extension of a product can be accomplished through reuse and repair. Innovative forms of consumption, such as product or infrastructure sharing (cooperative or sharing economy), may be an area where new business opportunities will emerge during the transition to the circular economy.

Waste management in the circular economy determines how waste is following a specific hierarchy in a priority order, starting from avoidance, preparing for reuse, recycling and recovering, energy production and ending up with rejection. This process brings enormous environmental benefits to our planet. Through waste collection and management, one part ends up in recycling and returns to valuable materials in the economy and most of the recyclable waste ends up in landfills, causing harmful effects on the economy and the environment. To achieve high levels of material recovery, appropriate legislative proposals need to be made to form a long-term vision for increasing recycling and reducing landfill of municipal waste. A circular economy focuses on the processing of secondary raw materials that are re-used, introducing them into the economy in the form of new raw materials, thus increasing security of supply. So far, secondary raw materials still represent a small percentage of materials used in the European Union (European Environment Agency, 2016).

5. MATERIALS AND METHODS

To gather the data for this survey, a specially structured questionnaire specifically designed for the research purposes was used as the basic tool. The questionnaire was distributed via e-mail ~~sent~~ to the 500 largest firms in Greece, listed in the annual business publication "THE STRONGEST OF THE GREEK ECONOMY" with the leading companies that are the pillars of Greek business (Direction Business Network, 2014).

The questions were chosen in such a way as to be brief and understandable for the maximum possible facilitation of the respondents. They were grouped into research-oriented categories to be homogeneous in the responses. The questionnaire included closed-format questions with quantitative

and qualitative features, grouped into 4 different groups and a total of 18 questions. The first group included 2 questions about the knowledge of the circular economy model. The second group consists of 2 questions related to the assessment of the circular economy in the business sector. The third group composed of 6 questions related to the practical applications of the enterprise in the circular economy model and finally the fourth group includes 8 questions related to the firms' profile. The questionnaire was created in the Google Forms application located at the link below <https://docs.google.com/forms/d/1sxpENrcvp7M5e7mZL4gWd1Rf60sKt6pXb8qjdoKC1E/edit>

Prior to initiating and conducting a survey, a content validity test of the questionnaire was applied. This audit included discussions with specialists dealing with the subjects of the circular economy. The reliability of the questionnaire content was based on a thorough review of the literature on the circular economy model. Before launching the survey, we pre-tested the questionnaire with three companies and a few adjustments were made to improve quality, flow and ease of completion. (Dillman, 2000).

The survey was conducted within 6 months (May - October 2018). After the first questionnaire, two reminders were also sent, to collect more answers. Altogether 30 questionnaires were collected with a response rate of 6%, which is quite low. However, searches in international literature have highlighted other cases of business-to-business surveys and have attracted a relative corresponding response rate (Koellner et al., 2010). Because of the great importance of the issue and the major interest of the Greek industry and policy makers on the issue, the research remains open as an ongoing research for the gathering of a bigger sample of industries.

The data were imported, processed and analyzed with the IBM SPSS Statistics 25 special statistical program, and related Frequencies, Descriptive and Correlations tests were made (Howitt & Cramer, 2003; Siomkos & Vasilikopoulou, 2005; Norusis, 2007), focusing on business practices for adopting the circular economy model over the different life cycle phases of their products and the resources they use.

6. RESULTS

6.1 Profile of the enterprises

The major business activity is mainly in manufacturing and other service activities (30%). Furthermore, the wholesale and retail trade with 26.7% and the construction sector (10%), electricity, gas, water and power generation are following with 3.3%. Most of the surveyed enterprises were established before 1990 (70%), and from 1990 to 2000 (26.7%). Then, there is a sharp downturn (3.3%) from 2000-2010, and no company in the sample has been established since 2010, indicative of the declining course of start-ups due to the recent economic crisis in the country. Regarding the average annual turnover of enterprises of the previous fiscal year, the majority of the sample (86.7%) stated

that it was over € 10 million. 6.7% of the respondents said their annual turnover was below € 3 million, while at a lower rate of 3.3% from € 3 million to € 10 million. 76.7% have over 250 employees, 13.3% have 10-49 employees and 10% have 50-249 employees.

The X² analysis showed that there is a strong correlation between the legal form of business and the knowledge of the circular economy model (Pearson Chi-square=13,038, App. Sig.=0,001 for level of materiality $\alpha=0,05$) (Table 1). The analysis did not reveal any other significant correlation of the knowledge of the circular economy model with the profile of the participating enterprises.

Table 1. Crosstabulation of the legal form to the knowledge of the Circular Economy

		Legal Form				
		Ltd	SA	Other	Total	
Knowledge of the circular economy model	Yes	Count	0	24	2	26
		Expected Count	0,9	21,7	3,5	26,0
	No	Count	1	1	2	4
		Expected Count	0,1	3,3	0,5	4,0
Total	Count	1	25	4	30	
	Expected Count	1,0	25,0	4,0	30,0	
		Value	df	Asymptotic Significance (2-sided)		
Pearson Chi-Square		13,038a	2	0,001		
Likelihood Ratio		9,618	2	0,008		
Linear-by-Linear Association		3,637	1	0,057		
N of Valid Cases		30				

a. 5 cells (83,3%) have expected count less than 5. The minimum expected count is ,13.

The percentage of respondent's enterprises which responded positively to the knowledge of the circular economy model is 86.7%, while the percentage that did not know the term is up to 13.3%. Percentages indicate the familiarity and visibility of the term in the entrepreneurial world. Most of the companies (43.3%) were aware of the model of Circular Economy; 26.7% stated to be well-informed while 16.7% of the companies were not informed. At a lower rate, 10% claimed to be fully informed, with the poorly informed to stand for the 3.3% of the surveyed companies.

6.2 Evaluation of Circular Economy approaches, procedures and policies

According to the replies of the respondents, (Table 2), product recycling is the major priority (4,37/5) with minimization of the environmental impact of the product's life cycle (4,27/5) and reusability of the product (4,20/5) to follow. According to the above, the possibility of recycling the product was considered by the sample as a determining factor in the circular model.

Table 2. Evaluation of procedures and products attributes for the transition to circular economy (1 not significant, 5 totally significant)

	N	Mean	Std. Deviation
Recyclability of products	30	4,37	0,765
Minimize the environmental impact of the life cycle product	30	4,27	0,740
Reusability of products	30	4,20	0,925
Increased product content in renewable materials	30	4,10	0,712
Biodegradation or composting of the product	30	4,03	0,999
Technological and environmental impacts in the production process	30	4,03	0,718
Repair of available spare parts	30	3,93	0,868
Impact on production costs through resource efficiency	30	3,90	0,607
Product durability in use	30	3,73	0,980
Product price	30	3,70	0,952
Strengthening consumer model for product sharing	30	3,50	0,777
Valid N (listwise)	30		

As mentioned, political cohesion is an integral factor in the circular economy. Businesses evaluated the policies that promote this model. More specifically, the major supporting policies are the funding of innovation through programs such as Horizon 2020, co-funded projects, banks, etc. (4,27/5), support for the development of circular economy projects such as the technical assistance and change of technical know-how (4,13/5), public incentives (eg financial guarantees) for private investors to finance projects favoring the circular economy (4,10/5), the promotion of innovative business models (3,93/5), the specific measures to encourage the adoption of the circular economy among small and medium-sized enterprises (3,83/5), the promotion and development of skills, qualifications and competences (3,83/5) and the promotion of innovative system approaches and cross-sectoral cooperation (3,80/5). In conclusion, projects supported by European funding are a key tool for promoting the circular model in enterprises and incentives for new businesses to turn to it.

The above ranking reveals the imperative need of the Greek industries to be supported by several policies that promote the Circular Economy model into their business transformation for a more sustainable and competitive manufacturing and other industry processes. Since Circular Economy, very often requires the development of product, process or organizational innovations, the supporting of the Greek industries by funding programs for innovation and acquisition of knowledge and know-how on the technology, processes, business models etc. for Circular Economy is highlighted as fundamental.

6.3 Implementation of Circular Economy by the Greek industries

According to Table 3, there are various practices followed by firms to adopt the circular economy model. In particular, the recycling of materials, products and energy seems to be the most used by the enterprises of the sample (3,77/5). Less important appears to be the rest of the practices presented in Table 3, which however constitute fundamental approaches and processes by a firm in adopting the Circular Economy model for creating close loops by extending products' life cycle or by developing

procedures for efficient use of resources. Thus, practices such as product life cycle analysis, material flow analysis, eco and modular design, industrial symbiosis and sharing consuming, are standing rather low in the relative ranking by the surveyed industries. In conclusion, there is a lack of use of certain business practices that are necessary for the proper operation of the model. However, with appropriate policies and extensive business information, the stimulation of the model will get another dimension. This is supported by the results shown above, regarding the need for supporting policies and funding programs for the industries to develop certain innovations under the model's context.

Table 4. Procedures for the implementation of Circular Economy by the Greek industries (*1 not significant, 5 totally significant*)

	N	Mean	Std. Deviation
Recycling of materials/ products / energy	30	3,77	1,305
Disposal of solidwaste in special concentration areas for transfer to sanitarylandfill	30	2,73	1,363
Purchase of products and raw materials with ecological certifications	30	2,50	1,383
Use of highly efficient mechanical equipment for optimal resource utilization	30	2,50	1,480
Disposal of raw material to other enterprise and industries	30	2,47	1,502
Recovery of valuable materials and reuse	30	2,33	1,422
Wastes utilization for energy production	30	2,30	1,489
Remanufacturing or repairing useful products	30	2,30	1,291
Product life-cycle analysis	30	2,23	1,382
Eco-friendly design of products	30	2,20	1,375
Material flow analysis in the production process	30	2,13	1,456
Sharing assets operations	30	1,90	1,029
Composting	30	1,80	1,186
Development of product design with subsystems	30	1,80	1,186
Biofuel production	30	1,73	1,285
Sharing consuming	30	1,57	0,898
Valid N (listwise)	30		

An analysis of the correlation with the use of Pearson coefficient has been applied to identify complementary practices for the implementation of the model by enterprises and their focus on adjusting their productive and business processes. According to the practices followed by enterprises for adopting the model of the circular economy, a correlation was found between (Table 4):

- Waste utilization for energy production and disposal of raw material to other enterprise and industries.
- Biofuel production and disposal of raw material to other enterprise and industries.
- Purchase of products and raw materials with ecological certifications and product life-cycle analysis.
- Product life-cycle analysis and development of product design with subsystems.

- Waste utilization for energy production and use of highly efficient mechanical equipment for optimal resource utilization.
- Waste utilization for energy production and material flow analysis in the production process.
- Disposal of raw material to other enterprise and industries and material flow analysis in the production process.
- Use of highly efficient mechanical equipment for optimal resource utilization and material flow analysis in the production process.
- Recovery of valuable materials and reuse and eco-friendly design of products.
- Product life-cycle analysis and reuse and eco-friendly design of products.
- Material flow analysis in the production process and eco-friendly design of products.
- Product life-cycle analysis and sharing assets operations.
- Development of product design with subsystems and sharing assets operations.

Table 4. Correlation of procedures for the implementation of Circular Economy by the Greek industries

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16

** . Correlation is significant at the 0.01 level (2-tailed). * . Correlation is significant at the 0.05 level (2-tailed).

The survey rates of this sample examined that the higher priority actions that promote solutions to the circular economy in the production process are access to finance (4,40/5) and support for the development of innovation in business models (4,07/5).

The following measures during the consumption phase were then assessed according to the survey sample (Figure 1). Businesses considered it essential and very important to provide additional information to consumers about the circular economy, such as the expected product lifetime (4,33/5), ensuring clarity and reliability by informing consumers (4,30/5), motivate users returning products after usage (4,27/5), encourage financial incentives for costumers, such as different taxation based on resource and product efficiency (4,27/5). Major measures continue to be the minimization of waste (4,20/5), the public awareness campaigns to support the transition (4,13/5), the design of environmentally friendly packaging (4,13/5), promote the development of repair and maintenance services (4,00/5) and finally clarifying the rules and practices that affect consumers protection, for example guarantees (3,9/5).

Figure 1. Evaluation of measures for promoting Circular Economy during the consumption face.

Then, the degree of benefits for enterprises of the circular model was examined (Table 6). A very significant benefit in relation to the majority of the sample were considered these of enhancing environmental sensitivity and corporate social responsibility (4,20/5), the promotion of economic growth without degrading the environment (4,17/5), the reduce of annual greenhouse gas emissions (3,90/5), the mobilization of local resources such as human resources, knowledge, funds, natural resources, culture etc. with the rest of the factors to follow.

Table 6. Evaluation of benefits for the Greek industries by adopting a Circular Economy model

	N	Mean	Std. Deviation
Enhancing environmental sensitivity and corporate social responsibility	30	4,20	0,925
Promote economic growth without degrading the environment	30	4,17	0,747
Reduce of annual greenhouse gas emissions	30	3,90	1,062
Mobilize local resources	30	3,70	0,877
Introducing new skills and knowledge into the labor market	30	3,60	0,770
Opening up new markets	30	3,57	1,251
Accretion of company market share	30	3,53	1,306
Creating innovative products and processes	30	3,47	0,973
Handling the economic crisis	30	3,47	1,008
Increase in annual turnovers	30	3,37	1,159
Valid N (listwise)	30		

Finally, 83.3% of the enterprises stated that they intend to integrate the circular economy model within the next five years, as opposed to 16.7% of the juxtaposed sample.

7. DISCUSSION AND POLICY IMPLICATIONS

The present research is a prototype one for the Greek business environment under the context of the Circular Economy model, since the literature on relative empirical studies is rather limited for the country. Thus, it gives the opportunity to highlight the proposed procedures, strategy orientation and products' attributes of the leaders of the Greek industry to adopt and implement this new economic model for development, enhancement of competitiveness and environmental protection under the lens of sustainable development. The research comes to a quite targeted time since, just a couple of months ago, on December of 2018, the Greek National Circular Economy Strategy, formed by the Greek Ministry of Environment and Energy, was approved by the European Commission. Based on the results of the study, the imperative need for policy measures is underlined to support several following major sectors such as the common use of resources, the promotion of industrial symbiosis, the sharing consumption and eco-design of products, life cycle analysis of products regarding required inputs and outputs for their production, consumption and environmental impacts, materials flow analysis etc. which are rather low in ranking regarding the adoption of the Greek enterprises. Only recycling and disposal at specific places for further collection of wastes seems till now to be ranked in a medium adoption rate. This is in line with the priorities of the National Strategy which sets as basic contents of the public policy on circular economy the industrial symbiosis, modular design and open innovation models for development of environmentally friendly products (Ministry of Environment and Energy, 2018).

Furthermore, the National Strategy sets several other priorities for action such as smart financing

tools with aids and tax-reliefs, utilization of public investments, development of concrete communicative strategies by the enterprises and institutions to raise citizens' awareness along with the provision of incentives, which are also in line with the findings of the present study. As highlighted, the Greek firms needs to be supported by initiatives for funding of circular economy by EU's innovation projects' public incentives to the consumers, better labeling and certification of products for consumers, information and establishment of a production and consumption culture based on the principles of circular economy such as cascading, closing loops and responsibility.

Regarding the main purpose of the research—to map the main procedures, business strategies and measures of the Greek industries for adopting and implementing the circular economy model during the whole life cycle of products, results indicate a rather low and mediocre response to the proposed approaches and a rather superficial adoption of the model (Trigkas et al. 2018; European Environment Agency, 2017; Geissdoerfer et al. 2016; Ghisellini et al. 2016; Lieder and Rashid, 2016; Tukker, 2015; Heshmati, 2015). Although the Greek firms of the study recognize the importance of adopting such methods contributing to sustainability, however they mainly remain to recycling procedures of products and materials for reuse purposes, which corresponds mainly to the phase before the final disposal of the remaining waste (European Commission, 2014). Thus, specific initiatives should be developed for the procurement of materials, modular and eco-design of products for achieving cascading use, life cycle and material flow analysis along with promoting a sharing consumption culture. The above mentioned could be visualized under the context of new entrepreneurial models such as social entrepreneurship, which is directly related to the fulfilment of the circular economy model and sustainable development (Trigkas et al. 2017; Geissdoerfer et al. 2016; Ellen MacArthur Foundation, 2015b).

However, several limitations of the study should be acknowledged. First, the sample is too small to allow for generalizations. A bigger number of participating firms is required to acquire more representative results. As stated in the beginning, the research is still ongoing, and we believe that in the future we will be able to extract results from a wider field of industries and a larger sample of companies in Greece. Furthermore, similar research should be applied to Greek SME's as well, in order to investigate the transition towards the circular economy model by the majority of the Greek business activity, a fact that is crucial for the full adoption of the model by the enterprises and the shift towards a new economic and development model.

ABSTRACT

This study explores farmers' willingness to pay for collective brand development schemes and identifies the factors that impact this. By assuming the utility maximization behavior of farmers who adopt a marketing innovation, based on data collected from 539 fruit and vegetable producers, we estimate a willingness to pay (WTP) model. Eight out of the 22 factors that have been examined it is found to impact farmers' WTP for collective brand development. More specifically, farmers who own larger fruit- and vegetable-producing farms have greater WTP as well as farmers who sell their products via cooperatives and those who have positive attitudes toward the local/regional associations of product brands. Farmers who perceive that consumers are interested in branded products are also more willing to pay for brand development schemes. Young farmers, those who perceive that they need financial credit, those committed to responding to brand quality requirements and those who intend to use the collective brands individually are more willing to pay, while those who prefer to participate in individual brand schemes are less willing to pay for collective brand development. Propositions for practitioners and for future research are given.

Keywords: WTP; brand schemes; farmers' characteristics; innovation; agricultural marketing, producers' brands

INTRODUCTION

The use of brands in agricultural products marketing is important for consumers' welfare and for farm businesses, encouraging them to adopt innovations, make improvements and provide better quality (Saak, 2012; Moschini *et al.*, 2008; Hayes *et al.*, 2004). The indicative benefits for farmers when they sell agricultural products under their own brands include product differentiation and a stronger market position for the products, as well as enabling effective product promotion efforts to be developed in domestic and foreign markets (Grashuis, 2018; Rhodes *et al.*, 2007; Kohls and Uhl, 2002; Beverland and Lindgreen, 2002; Beverland, 2001).

The brand development schemes for agricultural products can be individual or collective, the latter including local, regional and product-specific brands (Masuda and Kushiro, 2017; Rickard *et al.*, 2013; Ilbery *et al.*, 2005). In regard to geographic indications, it has been found that they can support a competitive provision of quality, benefiting consumers and producers if the production of the high-quality products draws on scarce factors that they own (Moschini *et al.*, 2008). The European and Euro-Mediterranean and Balkan regions are characterized by a large variety of ecosystems, which, interacting with the human factors, lead to the generation of a variety of local production conditions and subsequently a plethora of geographic indications. Thus, a large number of collective brands can be created that are based on local or regional names (Tieskens *et al.*, 2017; Ilbery *et al.*, 2005), and farm businesses have a wide variety of opportunities to use local or regional brand names in their marketing activities.

Given the small number of registered designations of origin against the large number of local/regional names that exist, a presupposition for such collective brand names to be exploited effectively is that the farmers must be engaged in brand development processes, as well as undertaking a part of the related costs, *ex ante* or *ex post*. Although farmers' willingness to undertake some of the related costs is crucial for collective brands' proliferation, to our knowledge, no publication has yet focused on this issue. The main goal of the present study is to explore farmers' willingness to pay (WTP) for such collective brand development.

This information is useful to farm businesses and to marketing cooperatives and producer organizations to plan effective collective brand development projects. It is also useful to food marketers searching for the exploitation of local or regional brands to formulate their marketing and purchasing strategies properly. The results can also help public authorities to schedule effective policy measures that help farmers to participate in brand development schemes in order to strength their market positions.

RESEARCH QUESTIONS

The brand development by producers can be viewed as an organizational and marketing innovation. We draw upon the literature that focuses on farmers' decisions or intentions to adopt innovations (Asfaw *et al.*, 2010; Karipidis and Tselempis, 2014; Kersting and Wollni, 2012; Teklewold *et al.*, 2013; Muriithi *et al.*, 2011; Veldstra *et al.*, 2014; Wollni *et al.*, 2010) to identify the factors that can impact farmers' willingness to engage in collective brand development schemes.

Summarizing the previous studies, it can be assumed that factors related to farm business characteristics, psychological constructions and behavioral factors can impact farmers' willingness to

pay for collective brand development schemes. Thus, this study aims to address the following three research questions:

RQ1: Do farm business characteristics shift farmers' willingness to pay for collective brand development?

RQ2: Do farmers' psychological factors impact their willingness to pay for collective brand development?

RQ3: Which behavioral factors impact farmers' willingness to pay for collective brand development?

METHODOLOGY

This methodology section describes the theoretical framework, the research questions and hypotheses, the proposed model specification and data collection.

Theoretical framework

Utility theory has been extensively used to study farmers' intentions and decisions to adopt innovations, such as innovations related to agricultural productivity/yields, environmentally friendly practices, quality certification systems and agricultural marketing (Asfaw *et al.*, 2010; Bandon *et al.*, 2009; Karipidis and Tselempis, 2014; Kersting and Wollni, 2012; Teklewold *et al.*, 2013; Muriithi *et al.*, 2011; Veldstra *et al.*, 2014; Wollni *et al.*, 2010). Farmers adopt an innovation if the expected utility of adopting it (U_i^m) exceeds the expected utility of not adopting it or retaining the traditional management practice (U_i^0).

We assume the utility maximization behavior of a typical farmer who intends (or not) to adopt an organizational and/or marketing innovation (such as product branding) and who decides to engage (or not) in a collective brand development project. Such a decision can be analyzed based on the farmer's willingness to undertake some of the costs of the brand development – that is, their WTP in order to participate. Based on the previously presented studies exploring farmers' decisions, it is expected that certain economic and social characteristics of farm businesses can impact farmers' WTP.

Farmers' decisions can also depend on their expectations regarding the benefits of participating in a brand development scheme; they also depend on their marketing experiences, leading to different levels of satisfaction regarding product selling and product buyers' behavior, as well as on the external support (services) the farmers perceive will be needed to participate. Lassoued and Hobbs (2015) indicated the importance of some other factors, such as brand trust, which is positively associated with consumers' confidence in a brand via trust in the food system, while Minten *et al.* (2013) highlighted the danger of the provision of incomplete or misleading information by a brand to consumers because, in some cases, the quality of products contained in branded bags may be low. In addition, Rickard *et al.* (2013) noted the possibility for a brand name to be based on product-specific aspects, besides local/regional aspects. Thus, we assume that a farmer's WTP can depend on the

farmer's commitment to responding adequately to brand quality requirements, on their attitudes toward the product and/or local aspects of the brand, and on their perceptions of consumers' interest regarding branded products.

It is apparent that the WTP can also depend on the farmer's behavioral dimensions, such as the marketing channel they use (Bandon *et al.*, 2009) and the individual actions or strategies of the farmer, such as the individual use of a collective brand and the preference to participate in an individual versus a collective brand development scheme. Figure 1 illustrates the conceptual framework, showing the relationships between these factors with the farmer's intention to participate and WTP in a collective brand development scheme.

While the expected utility cannot be observed, the adoption decision can be. In this case, we can derive the unobserved utility from the observed variable – that is, the farmer's WTP an individual cost for collective brand development. More specifically, the farmer evaluates the expected utility (outcomes) of participating in a brand development scheme by comparing it with the expected utility of the present situation – that is, without participating in a brand development scheme. They will choose to undertake a cost that is smaller than (or at least equal to) the expected utility (outcomes) to be derived, which can be measured by measuring the farmer's WTP.

While the expected utility cannot be observed, the adoption decision can be. In this case, we can derive the unobserved utility from the observed variable – that is, the farmer's WTP an individual cost for collective brand development. More specifically, the farmer evaluates the expected utility (outcomes) of participating in a brand development scheme by comparing it with the expected utility of the present situation – that is, without participating in a brand development scheme. They will choose to undertake a cost that is smaller than (or at least equal to) the expected utility (outcomes) to be derived, which can be measured by measuring the farmer's WTP.

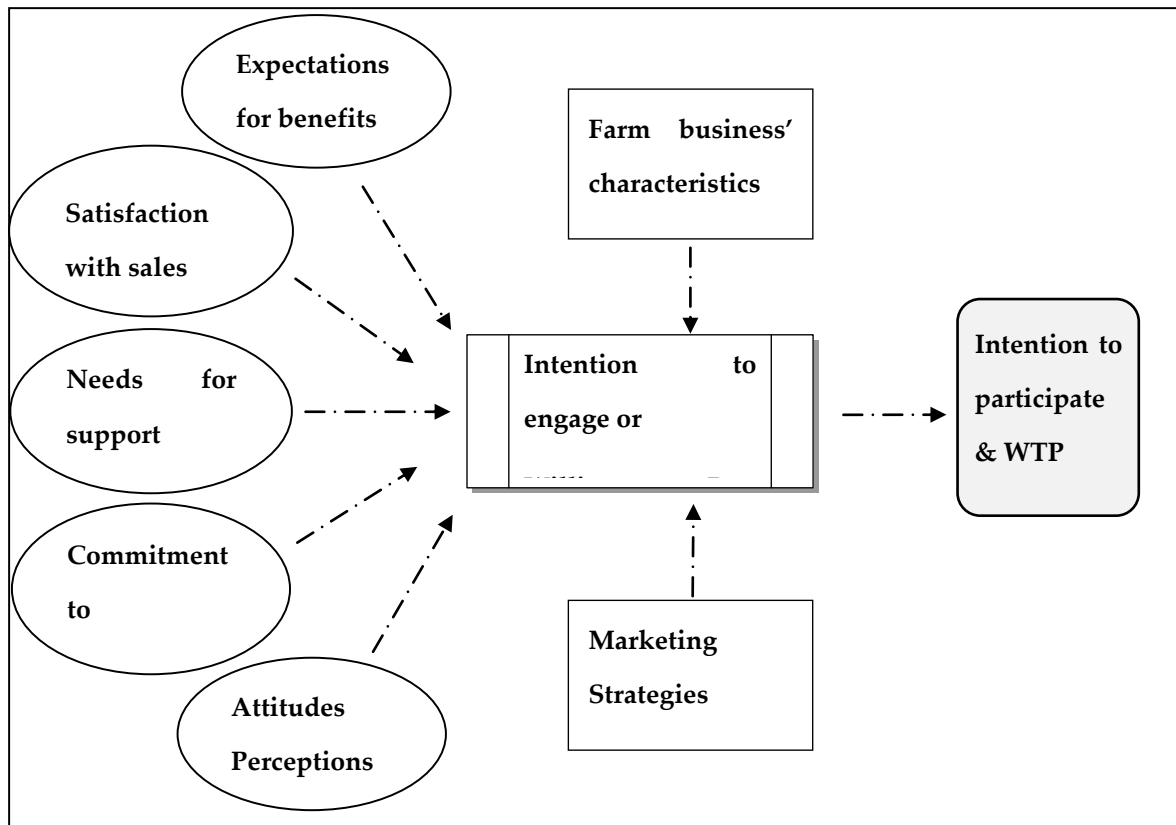

Figure 1. The conceptual framework of the farmer's intention to participate and WTP

Research hypotheses

In continuation of the above, 12 hypotheses are formulated, which are presented below under a summary of each research question.

RQ1 – importance of farm business characteristics

H1: A farmer's WTP depends on the farmer's age.

H2: A farmer's WTP depends on the farm business size – hectareage with crops in production stage.

H3: A farmer's WTP depends on quality certification attainment.

RQ2 – importance of psychological factors

H4: A farmer's WTP depends on their expectations regarding the benefits of participating in the brand development scheme.

H5: A farmer's intention to participate and WTP depend on the level of satisfaction regarding their experience with product selling and product buyers.

H6: A farmer's WTP depends on the external support they perceive they will need to participate.

H7: A farmer's WTP depends on their commitment to responding adequately to collective brand quality requirements.

H8: A farmer's WTP depends on their attitudes toward brand aspects regarding local/geographic indications or a product-specific brand character.

H9: A farmer's WTP depends on their perceptions regarding consumers' interest in branded products.

RQ3 – importance of behavioral factors

H10: A farmer's WTP depends on the marketing channel they use.

H11: A farmer's WTP depends on their individual use of the collective brand.

H12: A farmer's WTP depends on their preference to participate in an individual or collective brand development scheme.

Discrete choice model

Two theoretical models were formulated, with the dependent variable being the WTP for a brand development scheme. The independent variables were those factors that could impact the WTP a high or low amount for the brand development scheme, respectively. The common form of the two models is presented below (1):

(1)

In the WTP model, v represents the farmer's choice among three alternatives ($v=1, 2, 3$): pay a low amount (≤ 30 euros per hectare), a moderate amount ($>30 \leq 60$ euros per hectare) or a high amount (>60 euros per hectare) to participate in a brand development scheme.

X_m^{Cha} represents factors such as the economic and social characteristics of the farm business that can shift the farmer's intention to participate and WTP. X_j^{Exp} represents the expectations regarding the benefits of participating in the brand development scheme, while X_k^{Sat} represents the farmer's satisfaction regarding product selling and product buyers, X_l^{Sup} represents the farmer's perception regarding the need for external support due to participating, X_r^{Qua} represents the farmer's commitment to responding adequately to brand quality requirements, X_t^{Ref} represents the farmer's attitudes regarding the local/regional or product-specific aspects of the brand name, X_w^{Cons} represents the farmer's perception regarding consumers' interest in branded products, X_n^{MaC} represents the marketing channel that the farmer uses, and X_s^{PrC} represents the farmer's intention regarding private/individual use of the brand, as well as their preference to participate in an

individual brand versus a collective brand. The values are unknown parameters impacting the intention to participate and WTP.

Data collection

A survey was initially developed using the findings of previous studies, and a pre-test with some in-depth interviews was conducted in March 2016. Modifications were made until July 2017, as it was necessary to take into account the comments and suggestions received, which primarily concerned difficulties in answering the questionnaire (including its length) and the clarity and order of the questions. The questions were answered in personal interviews conducted with 600 fruit and vegetable producers dispersed all over the region of northern Greece, including the regions of Central, West and East Macedonia and Thrace, as well as Epirus. The data collection was completed in March 2018. These farmers were randomly selected from the fruit and vegetable production zones.

RESULTS AND DISCUSSION

After discarding a number of problematic questionnaires, we were able to use a total of 539 in our analysis. An independence test (Pearson's chi-square) of the WTP with each of the 40 initially selected factors was conducted by using SPSS. Table 1 presents the 22 factors that were found in association with the WTP after examining the consistency between them. In the same table, the measurement of each factor/variable is also presented.

Group of factors	Factor	Measurement
Farm business Characteristics	Farmer's age	1≤25, 2=26-35, 3=36-45, 4=46-55, 5=56-65, 6>65
	Hectarage with fruit trees in production stage	1≤20, 40≥2>20 40<3≤60 60<4
	Certification attainment	1=No, 2=Yes
Farmers' Expectations	Product differentiation	0=No, 1=Yes
	Guaranty for product quality	0=No, 1=Yes
	Recognition by consumers	0=No, 1=Yes
	Easy product sales	0=No, 1=Yes
	Higher producer's prices	0=No, 1=Yes
Farmers' Satisfaction	Satisfaction with producers' prices	1=Very &Extremely satisfied, 2=Moderately satisfied, 3=Not at all & Slightly satisfied
	Satisfaction with product sales	1=Very &Extremely satisfied, 2=Moderately satisfied, 3=Not at all & Slightly satisfied
	Satisfaction with product buyers	1=Very &Extremely satisfied, 2=Moderately satisfied, 3=Not at all & Slightly satisfied
Needs for support	Need support by cooperatives	0=No, 1=Yes
	Need support by subsidies	0=No, 1=Yes
	Need support by financial credit	0=No, 1=Yes
Commitment	Product quality related commitment	1=No & May be, 2=Yes
Attitudes toward brand reflections	Focus on locality character reflections	1=No & May be, 2=Yes
	Focus on product related reflections	1=No & May be, 2=Yes

Perceptions	for	
Consumers' interest	Consumers' interest for branded products	1=No & May be, 2=Yes
Marketing Channel	Share of sales in Exporter or Processor	1= \leq 30%, 2=31-60%, 3= \geq 60%
	Share of sales in Cooperative or Farmers' group	1= \leq 30%, 2=31-60%, 3= \geq 60%
Individual preference	Individual use of the brand	1=No & May be, 2=Yes
	Preference to participate in individual brand scheme	1=No & May be, 2=Yes

Table 1. *Factors impacting Farmers' Willingness to Pay*

As a second step, we used the same data to estimate the model following the (1) form. The analysis was conducted using Eviews software, based on the ordered logit form; we used the Huber/White option to compute robust (quasi-maximum likelihood) estimators, in the sense that consistent estimates of parameters are produced even if the distribution is incorrectly specified. The results, which are presented in Table 2, reveal a WTP a high amount (mean=1.665).

		WTP model

		Mean of Dependent V	1.665	

Table 2. *Results of Ordered Logit Model Estimation*

It was observed that eight out of the 22 factors examined contributed (significance level 0.10) to the formation of the dependent variable's variability at the 0.000 significance level. More specifically, regarding the farmers' and farm business characteristics examined, it was found that the farmer's age negatively impacted their WTP, implying that the young farmers were more willing to pay a higher amount for brand development. This could be attributed to the fact that they have a long-term horizon

in their thoughts, operations and actions. The acreage with fruit trees in the production stage positively impacted the WTP, while, as reported above, it was found to impact negatively the intention to participate. Because there are no studies exploring farmers' decisions related with brand development we compare our results with those of analogous studies examining farmers' decisions. Thus, taking into consideration analogous findings regarding the link between cultivated farmland and certification decisions (Karipidis & Tselempis, 2014), this implies that the owners of larger farm businesses are less willing to participate in brand development schemes (as explained above) but are more willing to pay if they are engaged in brand development schemes. Thus, this validates H1 and H2.

In accordance with the findings regarding the intention to participate, it was not confirmed that the expectations of farmers regarding the benefits of participation or their levels of satisfaction with their marketing experiences impacted their WTP. These findings imply that farmers count the expected benefits as important outcomes of participation, while the level of satisfaction with previous sales experiences does not encourage nor discourage them to become more willing to pay. Taking into consideration the importance of special education for farmers' choices (Asfaw *et al.*, 2010; Karipidis and Tselempis, 2014), this could be attributed to insufficient marketing-related knowledge among farmers. Regarding the perceived need for external support to participate in brand development schemes, it was found that financial credit positively impacted the farmers' WTP. Taking into consideration the importance of financial factors for some farmers' decisions (Muriithi *et al.*, 2011), this could be explained by the fact that the farmers perceived that the financial costs of participating in brand development schemes could not be covered by their own financial sources, implying that farmers' willingness to invest borrowed finance in a brand development scheme is linked with a higher WTP. This supports the validation of H6.

The quality-related commitment determined the farmers' WTP, implying that a farmer who commits to responding to brand quality requirements has greater WTP. It confirms and extends the findings of previous studies reporting that geographic indications support a competitive provision of quality (Moschini *et al.*, 2008) and highlighting the importance of geographical indications for incentivizing better quality (Saak, 2012). Taking into consideration the importance of farmers' managerial skills in marketing innovation adoption, this could be attributed to the fact that quality-related capabilities allow them to reap the benefits of the brand and give them greater WTP. Regarding the brand aspects that are based on locality-/regionality-related associations or on product-related associations, it was found that the WTP depended on the farmers' positive attitudes toward locality-/regionality-related aspects. This implies that farmers' positive attitudes toward brands that reflect a local or regional character are linked with a higher WTP. Thus, this validates H7 and H8.

Regarding the marketing channel that the farmer chooses, it was found that the share of products that the farmers sold via the cooperative or farmers' group positively impacted their WTP, implying that a farmer perceives such a choice to be more beneficial in the case that their products are marketed by a cooperative or farmers' group. The farmers' intentions to use the brands individually were found to positively impact their WTP. Opposite to this, it was found that the preference to participate in an individual brand development scheme negatively impacted the WTP, implying that a farmer who is willing to proceed with individual brand development is less willing to pay for collective brand development. These findings are in accordance with the logic and practice of the use of protected designations of origin and geographic indications by producers and markers who are certified by a third party (a certification body) (Hayes *et al.*, 2004; Ilbery *et al.*, 2005). These results offer the basis for H10, H11 and H12 to be supported.

CONCLUSION

To sum up, the present study goes beyond the registered protected designations of origin and geographic indications. It explored farmers' willingness to pay for a collective brand development, instead of being limited to registered brand names. This is its main contribution. By assuming the utility maximization behavior of farmers, based on data collected from 539 fruit and vegetable producers, we estimated an ordered logit model. The results indicate a high level of WTP. Eight out of the 22 factors it is found to impact it.

More specifically, farmers who own larger fruit- and vegetable-producing farms have greater WTP for collective brand development. Farmers who sell their products via cooperatives and those who have positive attitudes toward the local/regional associations of brands have also a greater WTP. Farmers who have negative attitudes toward cooperative support and those who perceive that consumers are interested in branded products are more willing to pay for brand development schemes. Young farmers, those who perceive that they need financial credit, those committed to responding to brand quality requirements and those who intend to use the collective brands individually are more willing to pay, while those who prefer to participate in individual brand schemes are less willing to pay for collective brand development. These findings, which concern organizational and marketing innovation factors, extend those of previous studies exploring farmers' intentions to adopt innovations and their WTP for them. This is the second contribution of the study.

Because the proliferation of collective brands generates benefits for farmers, consumers and local economies, the farm businesses, marketing cooperatives and producers' organizations should undertake initiatives to develop collective brands effectively, taking into consideration the factors that make farmers more willing to undertake some of the costs of brand development schemes. This is

especially important for small and medium farm businesses. Food marketing firms that could benefit from local or regional brand development should properly encourage farmers to participate in brand development schemes by creating efficient marketing and purchasing strategies that are based on locality or regionality aspects. Public authorities should properly schedule a policy mix that enhances farmers' knowledge related to marketing issues, reduces the financial burden on farmers and encourages farmers to create more value and strengthen their positions in the marketplace. Thus, the quality of life and welfare of consumers and farm households can be enhanced, a stronger market position for farm business products can be achieved, and the development of local economies can be promoted.

A limitation of the study is that though the findings reflect fruit and vegetable producers' intentions toward brand development, they do not offer a wide basis for generalization to other farm enterprises. This issue should be further explored in the future.

ABSTRACT

The aim of the present paper is to investigate the exploitation of the role of the Model Forest in local development, investment attraction and creation of new jobs. According to the International Model Forest Network (IMFN), in a Model Forest people representing various interests and views establish a partnership with the aim of achieving the following objective: to manage natural resources rationally while considering the history, economic situation and political identity in a way that does not jeopardize the future generations. Hence, stakeholders' and residents' opinion on the role of the Model Forest were examined. Specifically, the structured questionnaire was used to investigate the views of the residents in the Regional Unit of Grevena, while the semi-structured questionnaire and personal interviews were applied to examine the views of 13 relevant stakeholders. Results show that most stakeholders and residents acknowledged the benefits arising from the creation of a Model Forest and perceived that an enhanced exploitation of natural resources (forests, herbs, recreation, etc.) could improve the economic situation. Moreover, to achieve a more flexible management of natural resources, they recommended bureaucracy reduction and changes in the existing legislation. However, despite respondents' increased interest in the environment and natural resources management, a certain degree of hesitation to participate in a Model Forest was observed. The creation and worldwide projection of a Model Forest could attract numerous visitors through organizing meetings and conferences, contribute to the promotion of local products (either forest or non-forest products) and create new job positions supporting thus the country's local and regional development.

Keywords: Model Forest; local development; stakeholders; natural resources; Grevena

INTRODUCTION

After Rio Declaration in 1992, there is more debate on forest planning including the sustainability of ecosystems, multiple-use planning as well as ecological and financial values (Çakir et al., 2013). Effective communication consists the critical component for every effective partnership or cooperation

and oftentimes co-operations are established to facilitate interactions between two or more stakeholders benefiting all members and at the same time participation can benefit participants, the state and other stakeholders (Tolley, 2003). As for the motives for participating in partnerships and co-operations, these involve the investigation of creative solutions, the improvement of differences, the investigation of holistic approaches and the increase or improvement of business. A cooperation can be defined as a relationship where two or more parties with compatible objectives enter into an agreement for the implementation of something. Meanwhile, partnerships concern people working together in a mutually beneficially relationship and in many cases they do together things which they would not be able to accomplish on their own (Frank and Smith, 2000).

The identification of stakeholders' and residents' views who participate in a partnership can be viewed as the identification of factors affecting the participation of individuals or groups in a voluntary partnership for the benefit of the local society. From this perspective, the exploration of stakeholders' and residents' views assumes a greater importance as this knowledge can be used to create conditions which would attract greater participation in partnerships such as the Model Forest. Hence, the aim of the present paper is to investigate the views of the relevant stakeholders who are directly or indirectly related to the local development as well as of the residents on the role of the Model Forest and on a variety of topics related to the participation in the Model Forest in the regional unit of Grevena. The entire process focuses on reaching significant conclusions which can be used in an integrated effort to improve the exploitation of local natural resources, but also to address relevant environmental and local development-related issues. Moreover, the findings could be used by Model Forests in other countries to enhance the participation of stakeholders and residents in the creation and successful operation of Model Forests. Finally, similar studies examining the same topics should also be conducted in other Model Forests to compare how residents and stakeholders respond to such partnerships and indicate the factors that affect the participation degree in each case. Based on findings from various Model Forests, strategies aiming at enhancing the role of the Model Forest in local communities and economies but also increasing the participation of residents and stakeholders in Model Forests could be developed.

THEORETICAL FRAMEWORK FOR MODEL FOREST

The notion of Model Forest (MF) was first introduced in Canada in 1991. Once more countries participated, the Model Forest turned into the International Model Forest Network (IMFN). The International Model Forest Network is an international association, whose members cooperate for the sustainable development of natural resources and forest areas. Every Model Forest was established under different environmental and economic conditions, while different issues had to be faced (IMFN,

2011). The vision of the International Model Forest Network is to support the sustainable management of natural resources through a participatory process, so that environmental and socio-economic issues are reflected.

The principal mission of the Model Forest is to create an international network representing the majority of the world's largest forest ecosystems and to promote the participatory sustainable management of local resources. Moreover, the International Model Forest Network attempts to ensure that all partners, despite their political or financial situation, can contribute to and share the benefits of the Network. The main objectives are:

1. The promotion of the international exchange of ideas and solutions for the sustainable management of natural resources in forest areas.
2. The support for cooperation in crucial matters regarding solutions for the sustainable landscape and natural resources management.
3. The support for current international political conversations on criteria and principles of sustainable development and management of natural resources.

Model Forests are based on an approach which combines the social, cultural and economic needs of a local society with the sustainability of big landscapes, where forests consist a major part. In a conscious manner, a Model Forest is a process of voluntary partnership which is contingent on initiatives associated with silviculture, research, agriculture, mining, recreation and other values and interests in the context of a landscape (IMFN, 2011). The relevant stakeholders of a Forest Model work to define a common, local vision for the sustainable management of forest landscapes and cooperate to achieve this vision which will benefit all interested parties, who do not necessarily live within the physical boundaries of their own Model Forest. In fact, many Model Forests include organizations outside their territories. Additionally, while certain relevant stakeholders remain stable through the life of a Model Forest, others change the topics and programming over time. Notably, a variety of tools are used by Model Forests to create an image so that they are recognized not only within the Model Forest, but also throughout their vicinity. These tools are designed to provide a coherent picture of the Model Forest to the beholder and the most notable is the development of logos, namely the development of a brand, so that the Model Forest is presented in local, regional and national events and a picture of the Model Forest is projected in the media and local societies (Sawatzky, 2006).

Some of the benefits of Model Forests involve the effective management of natural resources, the support for education and learning in local communities, the promotion of local products, the support for information dissemination among the members of the partnership, exchange of know-how with other Model Forests, participation in European programs, the creation of new job positions, the

improvement of the financial situation, increased awareness among forest populations and the attraction of visitors.

The resulting benefits can be seen in Model Forests around the world which participate in the International Model Forest Network. An appropriate example would be the African Model Forest Network which since 2013 facilitated the distribution of organic fertilizers to the interested parties in Campo-Ma'an (southern region) and Dja et Mpomo (eastern region) in Cameroon. To secure the long-term access to organic fertilizers, the African Model Forest Network helped establish the Bio-fertilizer Production Center in Abong-Mbang which contributed to youth employment, increased demand and production of organic fertilizers, as well as development of marketing strategies. At the same time, the Sustainability Center aims at meeting the needs of the largest number of potential producers of agricultural producers, while providing high-quality products with low cost and accessible to rural communities. The Bio-fertilizer Production Center of the African Model Forest Network signifies the transition from one project to an ecological social enterprise which is viable, cost-efficient and sustainable in the long term. It is a reflection not only of a Model Forest strategy, but also of the development of a social enterprises network which can shortly bring wealth to the rural sector (PFBC, 2016).

Another noteworthy example is the Kyoto Model Forest which is extended in the entire Prefecture of Kyoto and presents a unique administration structure. The Kyoto Model Forest comprising approximately 13.000 private forest areas and 26 local governments is in essence a collection of small cut-off forests, where each forest has its own administration approach and all of them are united under the Model Forest flag. Since 2007, Coca-Cola has made donations to help the conservation of 106 hectares promoting thus the conservation of forests of the water catchment area and facilitating opportunities for volunteering for employers through the Model Forest. Another worthwhile contribution is the one made by the soft drinks company Suntory. The company has been offering both the required funding and volunteers for the conservation of 8000 forest hectares which surround 18 water refuges throughout Japan. Unquestionably, it only makes sense that soft drinks companies try to secure the viability of their water supply (IMFN, 2011).

At this point, it is of interest to mention the Initiative 20x20, which refers to the efforts to guide a country towards changing the dynamic of land degradation in Latin America and the Caribbean, through the restoration of 20 million hectares by 2020. Nine countries and two regional programs, including the Ibero-American Model Forest Network, took part in this initiative with private investors providing 365 million dollars. The Initiative 20x20 is supported by the Tropical Agricultural Research and Higher Education Center, the World Resources Institute (WRI), the International Center for

Tropical Agriculture (CIAT) and the International Union for Conservation of Nature (IUCN) (RIABM, (2016).

METHODOLOGY – STUDY AREA

The present study was conducted in 2016 in the Regional Unit of Grevena which is located in the southwest part of Western Macedonia. According to the census of 2011, the region of Grevena has a population of 31.757 inhabitants. Moreover, it is largely covered by forests (34.07%) and forest areas (22.38%) which are characterized by rare flora and fauna. In Grevena, there are many mountains and consequently 70% of the region has an altitude of more than 1000 m. Due to this altitude, the region presents optimal conditions for the development of livestock farming and the exploitation of forest-based products.

The data on the views of the stakeholders who are related to the management and development of natural resources were collected through personal interviews and with the help of semi-structured questionnaires. Personal interviews but with the help of structured questionnaires were used to gather the data concerning the views of the residents.

The views of 13 stakeholders and of the residents were investigated and all residents at the regional unit of Grevena were the “population” under study. To determine the size of the sample, simple random sampling without replacement was used. Following the application of this method, it was revealed that the sample had to be 223 residents.

As for the stakeholders who participated in the study, these involved the municipality of Grevena, the Chamber of Commerce and Industry, the woodworking industry ALPHA WOOD, the Hunter Association of Grevena, the Northern Pindos National Park, the forest cooperatives in the region of Grevena, the non-governmental organization “Valia Calda”, the Hellenic Rescue Team, the Directorate of Forestry in Grevena, the Mushroom Society of Western Macedonia, Secondary Education, the former chairperson of the Grevena Model Forest and Grevena Development Agency.

Regarding the questionnaires, some questions were common in both the semi-structured and structured questionnaires while the semi-structured questionnaire enabled the interviewer to ask additional questions to clarify the interviewee’s views. The questionnaire addressed to stakeholders involved questions concerning the management of natural resources and the Model Forest. In the first part, they were asked whether they perceived positive the utilization of the natural resources in Grevena and whether they were satisfied with the current cooperation among stakeholders in terms of natural resources management. The following questions explored the reasons the stakeholders participated in the creation of the Model Forest, the ways they would prefer to be informed about the Model Forest, the type of information they would be interested to exchange with other stakeholders,

the difficulties in creating a Model Forest and the advantages resulting from its creation. Additionally, respondents' opinion on the topics that the Model Forest should be engaged in was investigated. Finally, they were asked whether they considered that a novel effort to establish a Model Forest would be successful and whether they wished to take part in the process and if so in which areas. With regard to the questionnaire completed by residents, this included questions on their social and demographic characteristics as well as questions examining their perceptions of and interest in the environment and the management of natural resources in their region. First, participants were required to answer what is a Model Forest and to state how important they perceived the exchange of know-how through the International Model Forest Network. Moreover, they assessed the difficulties and advantages arising from the creation of a Model Forest as well as its objectives. As with the stakeholders, residents were also asked whether they were interested in participating in a Model Forest and if so in which areas. The most important step of a study design is the conduct of a pilot study prior to the actual study. Hence, the questionnaire was administered to a small number of individuals (15) and this helped improve certain imperfections that concerned the clarity of the questions, the syntax, the order of questions and the aesthetic quality of the questionnaire.

RESULTS

Thirteen relevant stakeholders from the Regional Unit of Grevena participated in the first part of the research which investigated the views of relevant stakeholders. Of these, eleven took part in the process of creating the Grevena Model Forest and were experienced in matters concerning natural resources management and the notion of Model Forest. Then, in the second part of the research the views of the residents were examined.

Views of the relevant stakeholders

Eleven out of the thirteen surveyed stakeholders participated in the creation of a Model Forest in the regional unit of Grevena. The reasons for participating in the process were many and varied. Specifically, a participating stakeholder was driven by beliefs in volunteering and giving, while another stakeholder regarded the participation as "self-evident" and another valued the reputation the local products would earn due to the creation of a Model Forest. Moreover, three stakeholders took part in the creation because they perceived that the resulting network would facilitate a more effective communication among relevant stakeholders regarding the protection and management of natural resources. Meanwhile, two participants regarded the idea of creating a Model Forest as innovative, whereas another respondent participated to acquire more information on the notion of Model Forest and three stakeholders because they wished to contribute to the sustainable

management of natural resources. In addition, two stakeholders did not participate because they were inadequately informed about the specific effort.

Eleven in thirteen stakeholders regarded the exploitation of the local natural resources as positive. Conversely, two stakeholders did not consider it to be positive on the ground that the exploitation of wood and forest residues is not managed correctly and does not reach the desired level. Finally, another participant looked favorably on it but considered that more efforts should be exerted to achieve the objective. Regarding the changes that could be made to make better use of the natural resources, there have been various proposals. Six stakeholders expressed the wish to change the existing legislation so that specific intervention operations, which are today prohibited, would be allowed as well as to manage the exploitation of natural resources at different levels. At the same time, two respondents recommended the exploitation of residues and the establishment of biomass plants which would create new jobs, whereas three participants suggested a better coordination among stakeholders and one the removal of bureaucracy. Finally, one stakeholder proposed that the state should demonstrate more willingness and provide residents with financial assistance for the exploitation of the local natural resources.

In terms of cooperation among stakeholders, five in thirteen stakeholders were dissatisfied with the existing cooperation with local stakeholders on the management of natural resources. However, seven respondents stated they were moderately satisfied, acknowledging the efforts despite the issues arising from the economic crisis and legislation. Notably, only one participant was totally satisfied with the cooperation with stakeholders.

Respondents were also asked about the difficulties in the creation of a Model Forest. Four participants regarded financial issues as the main difficulty, while other four the problem of volunteering in Greece and two the lack of cooperation. It also noteworthy that one participating stakeholder perceived that the Greek state does not place particular importance on the sustainable development of natural resources and another respondent viewed the lack of information as the main difficulty and finally one stakeholder mentioned the lack of public trust in the enterprise.

In evaluating the difficulties in the creation of a Model Forest, seven stakeholders identified the lack of interest in voluntary participation as an important and very important difficulty, whereas two as moderately important, three as slightly important and only one stakeholder perceived that there was no difficulty in voluntary participation. Meanwhile, the lack of funding was perceived by six stakeholders as a very big issue, by two as a big issue and by five as a moderate issue.

Respondents also assessed the difficulty of communication and trust among interested parties. Two participating stakeholders regarded it as a very big issue, one as big and the majority (eight

respondents) as a moderate issue. On the other side, two participants considered there was no such problem.

In addition, the lack of cooperation was not perceived as an issue by two respondents, while three participants viewed it as a slight difficulty, five as moderate and two as a big difficulty. Interestingly, only one stakeholder considered it a very big issue.

The perception that stakeholders and the general public do not benefit from the partnership was seen as a big problem by two stakeholders, whereas four respondents identified it as a moderate, five as a minor and only one as an insignificant problem.

All interviewed stakeholders agreed that the creation of a Model Forest will benefit their region. More specifically, for four participants the enhanced exploitation of forests and natural resources consisted a notable advantage, whereas four participants valued the promotion of the area and its local products, the employment and environmental protection.

Stakeholders were also asked to what degree the creation of a Model Forest will contribute to a more effective natural resources management. Results showed that most stakeholders recognized the contribution a Model Forest could make in this direction. Moreover, seven participants stated that the creation will help greatly in supporting education and learning in local communities, whereas five stakeholders perceived it would have a significant and one stakeholder a moderate contribution. The promotion of local products was regarded as a greatly important benefit by most participants (nine), as very important by two and as a moderately important also by two. The exchange of know-how was considered as a very significant consequence by seven stakeholders and as moderately significant only by one stakeholder. Meanwhile, the participation in European programs was evaluated as a very significant benefit by the majority of respondents (nine). As for the creation of new job positions, five stakeholders perceived that a Model Forest would make a very big contribution. In addition, nine stakeholders considered that the enterprise would inhibit inward and outward migration and only four viewed that it would not alleviate the issue of migration. Another interesting result was that most participants expressed a positive view on Model Forest's ability to raise environmental awareness among forest populations. In particular, most respondents regarded that it would have a very big influence on raising awareness, whereas only one stakeholder perceived it would not make a difference. It is also worthwhile to note that the vast majority of participants (eleven) viewed that the Model Forest could attract visitors to the area.

Stakeholders' views on the topics the Model Forest should be engaged in were varied. Most of them (eight) considered that the body should be occupied with topics regarding the management of forests and natural resources. Of the remaining respondents, two perceived it should deal with local products, three with tourism, two with product certification, two with hunting and two with

European programs. Furthermore, eleven participants considered that the effort to create a Model Forest would be successful, while two perceived that it would succeed only if the current conditions changed. However, all stakeholders were willing to participate in this effort.

Finally, respondents were asked about the fields in which they wished to participate. These involved Education-research, Local products, Tourism-recreation, European programs. Finally, it was indicated that four stakeholders were interested in all fields, while the remaining participants showed interest in fields which corresponded to their expertise.

Views of the residents

The primary collected data presented in this survey concerned the socio-demographic characteristics of the respondents, the assessment of significance, the participation interest, the obstacles, the benefits and the sectors that local residents would be interested in getting involved in case a Model Forest was created. As for the respondents' socio-demographic characteristics, there were slightly more male (55.2%) than female respondents in the sample. In terms of age, almost six out of 10 participants were aged between 31 and 50 years. In addition, the vast majority of respondents (79.8%) resided in Grevena and Deskati. Regarding their educational level, almost one out of three residents were high school graduates and approximately half of the respondents were university and technological educational institute graduates. A considerable share (48.0%) of respondents were employed by the public sector, whereas about one in seven participants were freelancers and one in ten were employed in the private sector.

Participants' views on whether the exploitation of local natural resources is positive were divided. That is, 14.3% of respondents regarded the exploitation as a very positive, whereas only 6.3% as an insignificant development. Additionally, a large proportion (30%) of stakeholders viewed it as minor, while 27.8% as moderate and 21.5% as very important.

Next, residents' level of satisfaction with the activities affecting the management of local natural resources was investigated. Results in Table 1 show that more than half respondents were dissatisfied with activities regarding cleaning and removal of combustible materials, wood quality certification schemes and protection from illegal logging which affect the natural resources management.

Activities	Not at all satisfied	Slightly satisfied	Moderately satisfied	Very satisfied	Extremely satisfied	Neither satisfied or dissatisfied
Logging	8.1	26	43.5	13	2.2	7.2
Timber transportation	5.8	29.6	40.4	12.6	2.2	9.4
Cleaning and removal of combustible materials	13	39	29.6	8.5	0.9	8.1
Firewood disposal (individual needs)	6.7	25.6	37.2	17.9	5.8	6.7
Application of forest legislation	6.7	22.4	36.8	20.6	4	9.4
Coordination among private sector– forest cooperatives– forest service	5.4	30.5	32.7	12.6	5.4	13.5
Wood quality certification schemes	19.3	30.5	20.6	10.3	3.6	15.7
Fire protection	4.5	28.7	38.1	13.9	5.3	8.5
Protection from illegal logging	17.5	32.7	23.3	12.6	5.4	8.1
Protection from poaching	18.8	26.5	26	17.5	3.6	7.6

Table 1. Table 1. Residents' level of satisfaction with activities influencing the management of local natural resources

Then, it was indicated that about seven in ten respondents (72.6%) considered that the exploitation of natural resources (such as forests, herbs, recreation, etc.) will bring financial benefits. On the other side, 22% of residents perceived that no change would emerge and 5.4% took a pessimistic stand as they considered that the economy would decline (Figure 1).

Figure 1. Evaluation of the economic situation due to exploitation of natural resources

Afterwards, participants were asked which information sources they would prefer for their information on the creation of a Model Forest. As it appears in Table 2, Internet was the most

preferred information source, followed by events and information days. In addition, a significant share expressed their preference for meetings with members of a Model Forest.

Information sources	Not at all	Slightly	Moderately	Very	Very much
Meetings with the members of the partnership	1.8	18.4	37.2	29.6	13.0
Internet – websites providing information about partnerships of this kind	1.3	14.8	28.3	39.9	15.7
Events-information days	2.7	14.3	32.7	32.3	17.9

Table 2. Residents' evaluation of different information sources regarding the acquisition of information on the creation of a Model Forest

	Not at all	Slightly	Moderately	Very	Very much
The management of natural resources in a way that does not jeopardize future generations	0.9	12.1	18.8	24.2	43.9
Education and research	3.6	6.7	22.4	39.9	27.4
Local development indicators	3.1	10.8	29.6	44.4	12.1
Cooperation with Universities, Technological educational institutes and Forestry Institutes	2.2	13.5	27.4	35.9	21.1
The benefits of stakeholders and the local people from the partnership	3.1	14.3	34.5	35.4	12.6
The implementation process	2.2	7.6	30.5	32.3	27.4
Searching for new opportunities	2.7	9.0	26.5	33.2	28.7
The better promotion of local Products	3.1	9.4	13.5	33,2	40,8

Table 3. Evaluation of objectives resulting from the Model Forest creation

Next, residents were required to assess the objectives of the Model Forest. As shown in Table 3, it can be observed that for most participants (approximately 70%) targets regarding the management of natural resources that secure them for the future generations, education and research, as well as the enhanced promotion and projection of local products were the most significant objectives. As already mentioned, there are many difficulties to be faced for an effective management of natural resources and hence respondents were required to evaluate the main difficulties in creating a Model Forest and in managing it. It can be seen in Table 4 that funding was perceived as the most important issue, followed by the lack of interest in voluntary participation and cooperation among interested parties.

Difficulties	Not at all	Slightly	Moderately	Very	Very much
Lack of interest in voluntary participation	3.6	13.5	27.8	27.8	27.4
Funding	3.1	13.0	22.4	23.3	38.1
Communication among interested parties	2.7	17.9	34.1	29.1	16.1
Trust among interested parties	4.5	16.1	34.5	28.3	16.6
Cooperation among interested parties	4.0	11.7	28.7	31.4	24.2
Lack of a common vision	3.6	17.0	30.9	22.9	25.6
Interested parties' perception that the general public and themselves do not benefit from the partnership	4.5	21.1	31.8	24.7	17.9

Table 4. *Evaluation of the difficulties regarding the creation of a Model Forest*

Regarding residents' view on the benefits arising from the creation of a Model Forest, it should be noted that most of them were highly rated (Table 5).

Benefits	Not at all	Slightly	Moderately	Very	Very much
More effective management of natural resources	1.8	11.7	35.0	35.4	16.1
Support for education and learning in local communities	0.4	13.9	28.3	39.0	18.4
Projection and promotion of local products	1.8	5.8	29.6	31.4	31.4
Support for information dissemination among members of the partnership	0.9	10.3	44.4	32.7	11.7
Exchange of know-how	0.9	12.1	33.2	33.6	20.2
Participation in European programs	0.9	9.0	30.9	35.4	23.8
Creation of new job positions	2.2	9.4	23.3	30.5	34.5
Economy improvement	4.0	13.5	21.1	33.2	28.3
Prevention of immigration	7.2	17.0	30.0	29.6	16.1
Raising awareness among forest populations	1.3	13.9	32.7	35.9	16.1
Tourist attraction	0.9	12.6	23.8	34.1	28.7
Environmental education	3.6	10.8	32.3	32.3	21.1

Table 5. *Respondents' assessment of benefits arising from the creation of a Model Forest*

However, most participants (65%) rated the creation of new jobs, the attraction of tourists (62.8%) and the improvement of economy (61.5%) as the most important benefits. Finally, other highly rated advantages included the support for education and learning, and the participation in European programs.

Residents interest in participating in a Model Forest was also examined. Interestingly, 43.5% expressed interest in taking part, while significant shares of participants were moderately (35.4%) and slightly (15.2%) interested. Meanwhile, only a small proportion (5.8%) expressed no interest in a voluntary partnership. The lack of interest can be accounted for by the economic crisis which often affects

attitudes. In other words, the high rates of unemployment as well as other problems resulting from the economic crisis inhibit volunteering. It should be noted that a volunteer is someone who unconditionally offers his/her time, knowledge and services for useful actions which benefit others without being forced to do so and without expecting anything in return. Undeniably, the cultural values characterizing a place play a significant role in awareness about volunteering.

Residents were also asked about the sectors in which they would be interested to offer their services through their participation in the creation of a Model Forest. As shown in Table 6, it was indicated that most would be interested in participating in European programs, tourism-recreation and local products. Conversely, only a minor interest in Websites providing information about the Model Forest Network was reported.

Sectors	Not at all	Slightly	Moderately	Very	Very much
Research-education	7.2	18.8	36.8	20.2	17
Tourism-recreation	4.0	16.6	30.5	30	18.8
Local products	9.0	13	30.9	31.4	15.7
Website -international Forest Model network	13	28.7	26.9	20.2	11.2
Participation in European programs	9.9	13.9	32.3	18.8	25.1

Table 6. Percentages of sectors in which participants would be interested to offer services through their participation in the creation of a Model Forest

Afterwards, residents evaluated different information sources in terms of their contribution to public information on the environment and nature. As presented in Table 7, the most favored information sources were the Internet (66.8%), education (62.3%), family (56.5%) and scientific experts (53.4%). In contrast to these, the least preferred sources were radio stations (16.2%) and local television networks (15.3%).

Information sources	Not at all important	Low importance	Moderately important	Very important	Extremely important
Family	7.2	11.2	25.1	37.7	18.8
Education	2.7	7.6	27.4	35.4	26.9
National television networks	8.1	17.9	43	23.3	7.6
Local television networks	15.2	32.3	37.2	11.7	3.6
Radio stations	12.6	31.4	39.9	13.5	2.7
Newspapers	7.6	23.3	40.8	23.3	4.9
Magazines	6.7	26.0	37.7	23.8	5.8
Internet	4.0	7.6	21.5	35.9	30.9

DISCUSSION - CONCLUSIONS

The Regional Unit of Grevena is rich in natural resources and their effective exploitation would contribute positively to the development of the area. According to Ziogana (2003), natural resources consist a basic and dynamic factor in economic and regional development, while they predefine the emphasis and escalation of economic activities in a certain area.

Although most participants acknowledged the benefits of creating a Model Forest and despite residents' great interest in the environment and natural resources management, a certain degree of hesitation in participating in this enterprise was noticed, which confirms that volunteering encounters difficulties. A possible explanation would be that the economic crisis which plagues Greece and the resulting negative psychology of Greek citizens affect greatly their voluntary participation in actions.

The more citizens are given the opportunity to express their opinion and preferences as inputs in decision-making processes and the more seriously these are taken into consideration, better and more sustainable decisions are likely to be taken (Schugurensky, 2003). Through a voluntary partnership of individuals and groups who work together for a common vision, such as creating a Model Forest and designing a three- or five-year strategic plan, many actions can be implemented in the area. The participation could be described as a process reinforcing the ability of individuals to improve or change their lives, namely as an empowerment catalyst (Cleaver, 2001).

The relevant stakeholders who participated in the process of creating the Grevena Model Forest were dissatisfied with the cooperation among stakeholders and expressed their wish for changes in the existing legislation and the reduction in bureaucracy, so that the exploitation of natural resources becomes more flexible and reaches higher levels. What is more, some of them even suggested the establishment of biomass plants to create new job positions. The region of Grevena presents not only remarkable timber quality, but also renowned mushrooms and other non-forest products, and hence through the worldwide projection of a Model Forest and the consequent certification of forests, brand names to market certain products could be patented as was the case with *Pinus nigra* of the Grevena Model Forest. Another example would be the Urbion Model Forest in Spain where timber is sold with the quality-label "Pino Soria Burgos". Moreover, it is possible that the projection of Model Forests would attract visitors and scientists through the organization of meetings and conferences. In addition, the exploitation of biomass could help meet energy needs (electricity and heating production), but also

provide employment and thereby keep the rural and forest population from migrating. Simultaneously, the energy that may be produced could be financially competitive with the one generated by conventional energy sources and contribute to the reduction in dependence on fuel imports. As Arabatzis *et al.* (2012) claim, biomass has been recognized as one of the most important renewable energy sources since it is able to contribute decisively to the energy needs of modern society and environmental protection both in industrial and developing countries. Timber and firewood consist the most notable source of biomass and in Greece due to the economic crisis an increase in the consumption of firewood is observed especially in rural areas. At the same time, renewable energy sources are called upon to play a key-role in addressing the global increased energy demand. Specifically, issues arising from the oil crisis emphasize the important role of renewables in economic development. According to Tsantopoulos *et al.* (2014), the development of renewable energy sources and photovoltaics in particular, presents a rising trend. To achieve the above, the main prerequisites involve changes in the existing legislation, which would render the system of natural resources management more flexible, bureaucracy reduction, public information on the advantages of a Model Forest and a reliable state providing a stable taxation system without over-taxation and emergency contributions. Hence, policy officers should organize their actions more effectively and utilize the natural resources in their region by taking into account the local residents' positive attitude and by using all financial means at their disposal. A crucial prerequisite for the flexible exploitation of natural resources is to make specific changes in the existing legislation and minimize bureaucracy.

ABSTRACT

The aim of the present paper is to examine the factors that influence the gross margin and the productivity of suckler cow in Greece. The paper uses structural equation modeling (SEM) which is a superior statistical technique to multiple regression used to determine the effect of financial and non-financial factors on the productivity of goat farmers in Greece. The research data was collected using questionnaires and through personal interviews with the "heads" of the goat farms during the years 2017-2018 in the region of Central Macedonia. This model hypothesizes that gross margin is predicted by the cost of labor (X1), the amount of subsidies (X2), the cost of feed (X3), the education level (years) (X4), the age of the head of the suckler cow farm (X5).

Keywords: Suckler cow farming, Structural Equation Modeling (SEM), Gross Margin, Managerial practices

INTRODUCTION

Suckler cow farming is considered to be a dynamic sector of animal production in Greece, as it contributes significantly to the national economy. In Greece, the cattle breeding is directly linked to grazing land and less to cultivated land, as in the case of dairy cows, and is therefore subject to competition in the use of available grazing land, mainly in the sheep industry and, secondly, in sheep farming. Suckler cows use effectively the grassland (mainly herbaceous) hilly-mountainous and less-favored areas, contributing significantly to the agricultural income of rural population (Hatziminagoglou et al., 2001). Moreover, suckler cow farming has as its main productive direction the bovine is an important livestock category mainly used to produce meat and milk for human consumption, covering about 18% of protein and 9% of its energy needs (Phillips 2001).

The Greek beef cattle sector with 178 thousand suckler cows represents only 2.22% of the total EU-27 suckler cow population (EUROSTAT 2013). The annual beef meat production does not exceed 34% of the country's needs, although suckler cow population has increased by 12% over the past five years due to the EU's premiums.

The Region of Central Macedonia covers 14.3% of the country's total area. In this area livestock farming is an important economic activity, as 767,000 ewes, 403,200 goats and 10,400 suckler cows (Hellenic Statistical Authority 2016) are extensively reared. According to recent ELSTAT data. (2017), the number of suckler cows has almost doubled (19,500) in recent years, largely due to the fact that most females born in previous years have been kept for breeding purposes.

Despite the medium productivity and the high quality of the products, the suckler cow sector has low competitiveness due to the high production costs compared with other EU countries (Vlontzos and Soutsas, 2006; Aggelopoulos et al., 2009). The majority of farms in the country operates under increasing returns to scale, so an increase in size to achieve lower production costs and improved profitability is necessary (Theocharopoulos et al., 2007). The total cost of production in a suckler cow farm configures the feed costs, mainly for fattening calves, the annual costs of purchased livestock, the annual costs of fixed assets and the remuneration of labor (Kitsopanidis, 2006).

The high cost of production in the Greek suckler cow farms is one of the major problems of the industry, resulting in reduced efficiency and low competitiveness in relation to other EU countries. As a result, every effort for business development of the industry should be coupled with reducing production costs. This study aims to identify and analyze the factors that affect the gross margin and the productivity of suckler cow sector in Greece. The paper uses structural equation modeling (SEM) which is a superior statistical technique to multiple regression used to determine the effect of financial and non- financial factors on the productivity of suckler cow farmers in Greece.

MATERIALS AND METHODS

The region of central Macedonia that is being studied consists of seven regional units and is located in the center of Northern Greece. In the sampling area there are 129 holdings of suckler cows with a size of more than 20 cows. The final sample includes 66 suckler cow farms with 6.122 suckler cows, accounting the 51% of all suckler cow holdings in the research area. The data were collected by a questionnaire taking into account similar surveys in other countries (Solano et al. 2011, Soini et al. 2012 & Martin-Collado et al. 2014) and some related studies in Greece (Aggelopoulos et al. 2011 & 2014, Gelasakis et al. 2013) and through personal interviews with the "heads" of the suckler cow farms during the years 2017-2018. Tire sampling method was layered randomly (Siardos, 2005). The variety of rearing conditions in this area allows the generalization of the research results, with no significant deviation from reality.

It is worth mentioning that, in the final analysis, small, medium and large farms were included and as a result there is a great variation in the cost parameters that are taken under consideration.

The empirical data are analyzed using Structural Equation Modeling (SEM). Structural Equation Modeling, though stemming from econometrics, is increasingly applied in various disciplines such as psychology, sociology, political science, education, and in business-related disciplines like marketing, strategy, and management accounting. Generally, Structural Equation Modeling is defined as "a class of methodologies that seeks to represent hypotheses about the means, variances, and covariances of observed data in terms of a smaller number of structural parameters defined by a hypothesized underlying model". A structural equation model consists of (a) the measurement models, which link the observed variables to the latent variables, i.e. to the constructs; and (b) the structural part, which links the latent variables by using systems of simultaneous equations.

Structural Equation Modeling provides estimates of the strength of all the hypothesized relationships between the constructs in theoretical models, by comparing the model to the empirical data. This comparison is accomplished by means of fit statistics. The fit statistics can be used for accepting or rejecting the assumed relationships between the latent and observed variables (measurement models) on the one hand, and the latent variables (structural model) on the other.

The construction sequence of a SEM is to specify the model's structure and economic relationships, to estimate the parameters from historical data and to validate the model in a simulation routine (Labys, 1988). Supply, demand and price formation processes are represented by endogenous relationships that simultaneously interact to determine each other's values. The main goals of SEM are to understand the patterns of correlation/covariance among a set of variables and to explain as much of their variance as possible with the model specified (Kline, 1998).

A two-stage sampling technique was used by applying simple random sampling. The data were analyzed using the Statistical Package for Social Sciences (SPSS) Version 22.0. For the analysis data were converted into per animal for the better understanding of the results. This study utilizes structural equation modelling (SEM) using the Analysis of Moment Structures (AMOS) for robust results.

According to the literature (Doll and Orogen, 1984; Damianos and Skuras, 1999; Kitsopanides, 2006; Aggelopoulos et al., 2009) the factors that compound the overall production cost are the labour cost, the annual expenditure of fixed capital (buildings, machinery), the cost of livestock breeding, the cost of animal feed, the total expenditure of variable capital (veterinary costs). According to Swain (2009), the agricultural subsidies are an essential aspect of agriculture and play an important role in international trade. They are considered the most effective mechanism for accelerating the growth of the agricultural sector. They are paid to farmers and agribusiness operators to supplement their income in order to management of offer of agricultural commodities or influence of the cost and supply of these commodities in the international markets. Moreover, according to Adesina and

Baidu-Forson (1995), the age of the breeders, despite their experience, they are not innovate and take risks in order to increase the productivity of their holding. This is mainly due to lack of education. Younger age breeders are willing to receive education, which enhances their ability to respond to innovate (Asfaw and Admassie, 2004). Thus the study hypothesized that gross margin is predicted by the cost of labor (X1), the amount of subsidies (X2), the cost of feed (X3), the education level (years) (X4), the age of the head of the suckler cow farm (X5).

RESULTS

According to the above theory, the following research cases are proposed for investigation

Ha1: The cost of labor is expected to have a direct positive effect on gross margin

Ha2: The amount of subsidies is expected to have a direct positive effect on gross margin

Ha3: The cost of feed is expected to have a direct positive effect on the gross margin

Ha4: The age of the farm manager is expected to have an indirect positive effect on the gross income.

Ha5: The educational level of the head of farms is expected to have an indirect positive effect on gross income.

	Mean	Standard Deviation	N
Gross Margin	682,81	25,420	66
Cost of foreign Labor	22,64	4.399	66
Subsidies	310,76	6.231	66
Cost of Feed	427,07	81.633	66
Education level (years)	9,600	4.123	66
Age	43.314	14.874	66

Table 1. Descriptive statistics

In Table 1, the average total valid observations summed to $n = 66$. An analysis of the descriptive statistics reveals that the mean score of gross margin is 682.81 €. Cost of foreign labor is in the range of 22,64 €. Subsidies are in the range of 310,76 € and the cost of feed is 427,07 €. Moreover, the mean of the years of education level was 9,600 and the mean of the age of the head of suckler cow farms was 43,314.

Best fit model for gross margin Maximum likelihood estimates.

The regression model that forms part of the SEM process confirmed that there are relationships between most variables, which are consistent with theory. The path coefficients presented in Table 2 are positive and significant at 5 per cent ($p < 0.5$). It is observed that cost of feed has a direct contribution to gross margin (0,118). Cost of labor have also a direct contribution to gross margin (1,312). Subsidies have a direct positive contribution to cost of feed (1,501) and cost of feed has a direct negative contribution to cost of labor (-0,063).

			Estimate	S.E	C.R.	p
Gross Margin	←	Cost of Feed	0,118	0,025	4,612	***
Gross Margin	←	Cost of labor	1,312	0,593	2,001	0,035
Cost of Feed	←	Subsidies	1,501	0,658	2,135	0,014
Cost of Labor	←	Cost of feed	-0,063	0,028	-2,473	0,008

Table 2. Regression weights (group number 1 - default model)

			Estimate	S.E.*	C.R.**	P***
Gross margin	←	Education level	0,831	0,210	0,554	0,020
Gross margin	←	Age	0,087	0,081	0,645	0,006

Table 3. Indirect effects- Two tailed Significant (PC) (group number 1 - default model)

Table 3 shows the indirect effects to gross margin. Education level and the age of the suckler cow breeders have an indirect effect in gross margin.

Model Fit for SEM using goodness of fit indices.

Diagram 1: SEM Model-relationships between most variables

The main objective of this study was to test the relationship between gross margin and some exogenous and endogenous variables. All the indices in Table 3 confirm that all the sample data fit to the model.

Index	Recommended value	Remark
CMIN/DF	1.312	Very good
GFI	0.958	Very good
TLI	0.985	Very good
CFI	0.992	Very good
AGFI	0.901	Very good
RMSEA	0.072	Very good

Table 4. SEM model fit indices

The GFI and the AGFI were 0.958 and 0.901 respectively. The CFI was 0.992 and the RMSEA was 0.072. Moreover, TLI was 0.985 and CMIN/DF was 1.312.

CONCLUSIONS

As shown from the results, cost of feed and cost of labor have a direct contribution to gross margin. Cost of feed has a direct contribution to cost of labor and subsidies have a negative contribution to cost of feed.

The competitiveness of suckler cow farming in Greece can be improved either through a further increase in productivity, or by lowering the overall production costs. First of all, labor has a strong correlation with gross margin. That means, a rational valorisation of labor, mechanising production

(e.g. installation of milking systems), a modernisation of the facilities for ergonomic purposes, should lead to a reduction of this cost component. Moreover, in order to lead to the optimum exploitation of feed factor, a well-balanced and inexpensive feeding is recommended. The knowledge of animal feed contents in nutritious ingredients and their suitability as well as efficient mixing, feeding and storage facilities of animal feed should lead to the improvement of the used animal feed. It is recommended the subsidies to be connected to the yield and not with the uncontrolled increase in the suckler cow population. Furthermore, education has a positive impact on the economic outcome of farms because through education the suckler cow breeders can ensure the sustainability of the farms.

Additionally, the application of structural equation modeling can constitute a "guide" for goat farms for the provision of financial support, for an evaluation of the existing status and for gaining a competitive advantage in relation to other similar form of farms. Through structural equation modeling the investigation of the relationship between inputs and outputs is also possible. This allows the rational exploitation of inputs and outputs, the restructuring of the used inputs and the reduce of production costs.

CONSUMERS PERCEPTION OF FOOD SAFETY RELATED RISK IN THE ITALIAN MARKET

Tulone, Antonio; Crescimanno, Maria; Giacomarra, Marcella; Galati, Antonino

Dept. of Agricultural, Food and Forest Sciences, University of Palermo, Palermo, Italy

ABSTRACT

The aim of this paper is to define the factors affecting the consumers' perception on food risk associated to the consumption of products (i) containing food additives, (ii) obtained with the use of pesticides, and (iii) processed through novel food technologies, in relation to different socio-economic and demographic characteristics, the source of acquisition of information on food safety issues, and the place of purchase of food. The study is based on a sample of 392 consumers, living in Italy, and it uses three ordered probit estimation models to process data collected. Findings show that food risk perception is greater among youngsters, mainly for the additives and residual pesticides in foods, and among respondents which do not pose attention to the advice of friends or family members and acquire information by them. In overall, variables affecting the foods risk perception are different in relation to the three typologies of food issues. Our study provides some theoretical, managerial, and political implications.

Keywords: Food risk; Socio-economic factors; Additives; Pesticides; novel food technologies; Information sources; Ordered probit model.

INTRODUCTION

In recent years, the issue of food safety has become increasingly important in the political agendas of governments in order to guarantee greater safety for the health of citizens and consumers in particular (Bánáti, 2011; Dosman *et al.*, 2001). This interest comes after several food scandals, fear of intoxication, growing awareness of the dangers deriving from the intake of chemical substances that have affected the consumers' perception of food risk (Bánáti, 2011, Parlato *et al.*, 2014). This food risk perception is linked to the presence in the foods of pesticide residues (Cerroni *et al.*, 2013; Dosman *et al.*, 2001) and additives (Bearth *et al.*, 2014; Dosman *et al.*, 2001; Wu *et al.*, 2013), to the processing techniques, as can be the novel food technologies, such as ionizing radiation, microfiltration, and pasteurization (Behrens *et al.*, 2009; Cardello, 2003; Cardello *et al.*, 2007; Kim *et al.*, 2014), to the information sources on food risk (Liu *et al.*, 2014; Pieniak *et al.*, 2007) and to the places where the food products are purchased (Onozaka *et al.*, 2010; Smithers *et al.*, 2008; Yu *et al.*, 2017). In this regard, a survey on the perception of food risk among European consumers reveals that chemicals, pesticides, and other toxic substances represent the

main source of concern for 19% of respondents (Eurobarometer, 2010). This percentage reaches the 30% among Italian consumers, probably due to the greater importance of the food culture in Italy that makes the Italian consumer more attentive to the characteristics of the foods eaten (Eurobarometer, 2010). In addition, the Eurobarometer survey (2010) shows that European consumers express greater trust on the information provided by doctors and other health professionals (84% of citizens interviewed in total), and personal contacts, such as family and friends (82%).

Trust in the source of information is, in fact, a factor that affects the perception of food safety, as emerged in the economic literature. In this respect, Pieniak *et al.* (2007), for instance, found that personal contacts are the most frequently used sources of information for European consumers, although doctors, dieticians and public health recommendations represent the most trusted sources of information. A similar result is obtained by Liu and co-authors (2014) in the Chinese market, showing that television and exchange of view between friends and relatives are three channels of information most used among consumers to obtain information, while the opinions of doctors, research institutes, and personal experiences are sources of information on which consumers place greater trust.

Today, consumers are increasingly looking for healthy products and in many cases are looking for direct contact with producers who can offer them greater guarantees. Behold, that the places of purchase play an important role in reducing the food risk perceived of consumers. In this regard, Yu *et al.* (2017), investigating the perception of food quality and safety in US farmer's markets, noted that a majority of farmers' market consumers have a positive perception of food safety. This greater guarantee of food safety is also found in other empirical studies, as in Onozaka *et al.* (2010) and Smithers *et al.* (2008), where locally grown and sold products are perceived as better in terms of freshness, quality, safety and nutritional values.

There are few studies in the economic literature that deals with the effects of socio-economic characteristics, such as gender, age, educational level, and income, on the consumers' perception of food risk. For instance, Bearth *et al.* (2014) and Wu *et al.* (2013) suggested a greater perception of food risk among women due to the presence of colours and sweeteners in food, confirming the results of Dosman *et al.* (2001) that showed, few years before, that women are more inclined than men to perceive the risks associated with food additives, food contamination and pesticide residues. Age also seems to play an important role in highlighting however discordant results. On the one hand, Dosman *et al.* (2001) showed that older people perceive pesticide residues in food as a risk factor linked to food safety and health, on the other hand, Cerroni *et al.* (2013) shows that young people and, particularly, consumers who have a higher level of education, have great sensitivity of food safety issues. In addition, Wu *et al.* (2013) found that men, that are younger and with low income and education level, have a lower food risk associated with the purchase and consumption of food products containing

additives, probably because they are more likely to trust government institutions that regulate food additives.

Taking into account that there are factors affecting the perception of food risk perceived by consumers, the identification of those factors that most condition the buying decision is useful not only for the definition of effective communication strategies of companies operating in the agri-food sector but also for policymakers in order to outline the most impacting economic policy measures on social fabric. In light of the above, the purpose of the study is to outline the factors affecting the consumers perception of food risk associated to the consumption of products (i) containing food additives, (ii) obtained with the use of pesticides, and (iii) processed through novel food technologies, in relation to different socio-economic characteristics, the primary source of consumer information on food safety issues, and the places of purchase. In doing this, the study is based on a survey carried out in Italy involving 392 consumers.

MATERIALS AND METHODS

An online survey was carried out between January and March 2018 to analyse the main factors affecting the consumers' perception of food risk. The link of the questionnaire were circulated on the Facebook platform and was promoted also by ADICONSUM, one of the most important association to the defence of the consumers in Italy, through their website and their social channels. The research involved 392 people living in Italy, and their number and socio-demographic characteristics reflected the distribution of the Italian population over 18 years of age in all 20 Italian regions.

The online questionnaire, designed after a thorough review of the literature, was organised into three different sections. In the first section, respondents reported their level of concern associated to three different categories of risk connected to the food safety issues, such as (i) the addition of additives and preservatives to foods, (ii) the use of pesticides, (iii) and the adoption of novel food technologies. A Likert scale ranging from 1 to 5 (where 1 was "not at all" and 5 was "very much") was used for this purpose. The second section collects information about the places of purchase in which the respondent perceives greater guarantees in terms of food safety, and the sources from which the respondent acquires information on food safety. In both cases a 5-point Likert scale was used, where, in the first case 1 was "greater guarantee" of safety and 5 "lower guarantee", while in the second case 1 was "not at all" and 5 was "very much". The last section included questions covering all the socio-economic and demographic features of the respondents, such as gender, age, number of household members, level of education, employment, the region of residence, and monthly net income expressed in euros.

Data collected were processed using an ordered probit estimation model. This method fits as well as the dependent variable expresses an opinion of the respondents, such as “agree”, “neutral”, and “disagree” (Katchova, 2013). The ordered probit is defined as:

$$y^* = \beta'W + \varepsilon_i,$$

where the y^* is unobserved dependent variable, W represents a matrix of explanatory variables, β is the vector of regression coefficients, and ε is the vector of random error terms. Being y^* unobservable, we can observe the response categories instead, as follows:

$$y = 0 \text{ if } y^* \leq 0,$$

$$y = 1 \text{ if } 0 < y^* \leq \mu_1,$$

$$y = 2 \text{ if } \mu_1 < y^* \leq \mu_2,$$

where y represents the observed choice of food risk perceived by sample, with choices from 0 to 2 (where 0 = “not at all”, 1 = “neutral”, and 2 = “relevant”), while μ_i are the threshold parameters that are estimated together with the β coefficients.

In this study, three regression models were performed to understand the impact of the explanatory variables on the perception of food risk coming from the consumption of products (i) containing food additives, (ii) obtained with the use of pesticides, and (iii) processed through novel food technologies.

Finally, to evaluate the goodness of the models different tests were estimated, such as LR chi2, Log likelihood, and Linktest.

RESULTS AND DISCUSSIONS

Table 1 shows the marginal effects of three ordered probit regression models. Despite the low values of Pseudo R2, which could lead to thinking of a low ability of the independent variables to explain the relationship with the food risk perception of our sample, it is no cause for alarm as models with low R2 values can still fit the processed data well (Allison, 2014), as can be seen from the values of LR chi2 statistic test. Furthermore, the Linktest values highlight the goodness of the three proposed models.

Results of the proposed models show relevant differences in the explanatory variables that are able to significantly affect the perception of food risk among Italian consumers, due to the presence of additives, residues of pesticides and the adoption of novel food technologies.

In detail, the perception of food risk associated to the presence in foods of additives would seem greater among youngsters, among interviewed who have low trust in the friends and family's opinions, and who perceive the products purchased in the Large-Scale Retail Trade (LSRT) as unsafe. These results in part are not consistent with other empirical studies according to which young people have a lower perception of food risk associated with the purchase and consumption of food products containing additives (Wu *et al.*, 2013). On the other hand, our findings show that respondents who perceive the highest food risk associated with the presence of food additives are those who do not turn to friends and family to learn about the healthiness of processed foods. This conclusion is consistent with Liu *et al.* (2014) and Pieniak *et al.* (2007), which show that consumers with greater concern about food safety issues have little trust in food alarms and opinions learned from friends and relatives, or by mass media and social network, placing greater trust on the opinions provided by doctors and competent bodies in order to satisfy their information needs adequately and without incurring false food alarms. Furthermore, the individuals most concerned about the presence of additives in foods perceive the products purchased in the LSRT as unsafe compared to those purchased from farmers. This is probably because consumers believe that foods purchased from the farmer are safer, more genuine and natural (Onozaka *et al.*, 2010; Smithers *et al.*, 2008). This is also confirmed by Yu *et al.* (2017), which, in their study on the consumers' perception of food safety in US

farmer's markets, found a greater perception of food safety by consumers in the products purchased, thanks to the higher perceived quality of products.

By observing the results of the proposed model related to the perception of food risk associated to the presence of residues in foods products of pesticide used in agriculture, appears that Italian consumers most concerned by this issue are young individuals, with a lower level of education (it should be noted that almost all the individuals present in the sample analysed attended the upper secondary school) and high income, who not acquire information on the risks of the consumption of food containing residues from friends and relatives or circulating on the Social Networks, and that perceive the products of the LSRT as safer. This result is in contrast with Dosman *et al.* (2001) who find that pesticides represent a risk factor for older consumers and for those with a low income, bringing back this result to the fact that individuals who have a higher income can reduce food risk by buying products more expensive and therefore safer for their health. Instead, our result suggests that a low level of education is connected with a high perception of risk coming from pesticides residues. This, according to Cerroni *et al.* (2013), could be traced back to the fact that education is connected to the ability of individuals to elaborate information on food risk, but at the same time, this variable could be linked to the ability to understand the potential health risks. Furthermore, Italian consumers, that perceive more the risk related to the presence of residues in food, consider the products of the LSRT as safer. This result highlights how a superior guarantee of safety was identified by these individuals in the purchase of food at the LSRT, probably for the numerous quality controls to which the products are subjected in this distribution channel before reaching the final consumer (Dadzie and Nandonde, 2019).

Finally, taking into consideration the perception of food risk associated to the use of novel food technologies, respondents more concerned are men, who have a higher level of education, and who acquire information mainly from doctors and experts, rather than from friends, Mass Media, and Social Network. This result is partially in contrast with what emerged in the study of Cardello (2003) and Cardello *et al.* (2007), according to which men give a low level of importance to the risks associated with the use of novel technologies in food processing, noting that the consumption of food processed with novel technologies, in fact, is a source of concern among consumers. That is why, probably, the individuals who are more educated, and therefore more aware of the risks that can have consuming this type of food, perceive more the food risk connected with the use of novel food technologies. A recent study carried out in Italy by Galati and co-authors (2019) reveal a considerable interest among respondents in receiving information describing novel food technologies as a method of increasing food safety, showing that this interest is greater in respondents professing high sensitivity towards food safety issues.

CONCLUSION

This research analyses factors affecting the perception of food risk perceived by Italian consumers in relation to three different categories of food safety issues: the presence of additives in foods, residues of pesticides in foods, and use of novel food technologies. Our findings show that socio-economic and demographic characteristics are good predictors to understand the food risk perceived by consumers. In particular, food risk perception is greater among youngsters, mainly for the additives and residual pesticides in foods, and among respondents which do not pose attention to the advice of friends or family members and acquire information by them. In overall, the risk perception among Italian consumers is highest among respondents that usually not acquire information on the negative effects related to food consumption. Furthermore, even the food safety perceived in the places of purchase has a strong influence on the perception of food risk, although it differs in relation to the type of food issue.

In view of the above, our study provides some theoretical, managerial, and political implications. From a theoretical point of view, our research contributes to the enrichment of the economic literature on the perception of food risk taking into consideration socio-demographic and economic variables, the source of information on food safety and the place of purchase.

On the managerial point of view, our results provide insight and hints to entrepreneurs of companies, operating in the food sector, interested in improving the effectiveness of their communication strategies. The understanding of the factors that most condition the food risk perception among consumers could be useful, in fact, to define effective communication strategies in order to reduce the perception of the risk related to certain types of food products and issues, increasing in this way the preferences and the consumers' purchasing decisions.

Switching to a political perspective, the results of our investigation could be used by governments to define adequate policies, programs, and measures in the field of food safety. Indeed, the socio-economic characteristics of consumers, their purchase behaviour and the source of information acquisition on food alarm affect individuals' perception of food risk. In this regard, governments could reduce the perception of food risk through specific information programs and awareness campaigns intended for the different categories of consumers, to improve and increase the food safety perceived by citizens. In this sense, particular attention could be given to educational programs in primary schools, where educational programs would seem to have a greater impact. Furthermore, to this must be added the need for greater transparency of information on the foods eaten. To this end, it would be desirable to make food product labels clearer in content and with more detailed information on the technologies and processes used for their processing.

Despite the value of the study, the research focuses only on three types of issues related to food safety. In this regard, future research could also investigate, for example, other food risks that concern Italian consumers and not only. In fact, a possible development of the research could concern the issues of food safety in the European market, outlining any differences existing between the different EU member countries, and intercepting the perception of the food risk of consumers who are part of the European free trade market, in order to prepare appropriate measures to stem the fear and food risk in Europe.

THE NEED FOR TEACHING COMPASSIONATE SELF-LEADERSHIP IN A UNIVERSITY SETTING

Tzortzaki, Alexia Mary

Department of Accountancy and Finance, School of Management and Economics, Hellenic Mediterranean University, Crete, Greece.

ABSTRACT

The purpose of this paper is to highlight young adults' need to develop compassionate self-leadership competencies in order to thrive and to be of service to today's fast-paced, polarized society. The paper's originality lies in the fact that it provides a pioneering blueprint for such a training intervention. The positive effects of self-leadership on personal excellence and leadership itself are well evidenced. Likewise, so is the call for more compassionate servant leaders. Nevertheless, the linchpin for compassionate leadership to be sustained is the nurture of self-compassion. Grounded on two of the most influential models of emotional intelligence and self-leadership theory, the proposed conceptual framework reflects the importance of self-compassion in leadership effectiveness. It posits a fresh, more dynamic approach to previous studies which mainly originate in task and material oriented cultures and it suggests a self-leadership style that focuses more on human connection. Moreover, the current study also conveys initial empirical evidence of the effectiveness of using the framework to train students in a state business school environment. Two methods of investigation were used for this: a qualitative end-of-course evaluation questionnaire and a pre and post course questionnaire that measured the participants' change in compassionate leadership levels. Preliminary findings suggest there is a positive change and this opens the way for further research.

Keywords: soft skills, life skills, self-leadership, self-compassion, compassionate leadership, fourth industrial revolution, model, knowledge worker, ecology

INTRODUCTION

With the emergence and study of transformational leadership, back in the early 1990s (Bass and Avolio, 1990; Locke *et al.*, 1991), a clearer understanding arose of the makings of an effective modern leader. The 'tsunami' effect of the Fourth Industrial Revolution has changed the landscape of employability. Reverberating the words of British education reformist, Derry Hannam, during his key note speech at

the European Conference of Democratic Education (2018), “preferred job candidates need to possess skills that computers lack, such as those of a leader”.

In order to deal with our highly chaotic world, the emphasis is nowadays on possessing soft skills, such as adaptability, creativity, highly developed communication skills, a clear sense of mission and social responsibility (Moss *et al.*, 2009; Rast, 2015). This emphasis is not just about “doing business as usual”, but it is about the early stages of a huge shift in the evolution of humanity, that moves us from the century-old limiting belief that in order to survive, each individual needs to be in competition and engage in conflict with the rest, to the new belief that in order for all of us to thrive we need to cooperate, help and care for each other (Clancy and Binkert, 2017). As with all paradigm shifts, the transition is not unproblematic. Hence, even though online social networking is on the rise, there are strong indications of a society of increasingly lonely people and a decline in our ability for meaningful interaction, face to face communication, collaboration and compassion (Akram and Kumar, 2017; Subramanian, 2017; Dierendonck, 2011; Amritaswarupananda, 2013).

Historically, academic scholars study phenomena before they become widespread. The changes mentioned above have only recently started to be addressed at the level of policy making, education and industry (OECD, 2016). Nevertheless, more than two decades ago the start of these changes fuelled the quest for the study of a new area of leadership, which resulted in the rise of self-management and self-leadership literature (Manz, 1986; Manz and Neck, 2004). The pioneers of self-leadership claimed that in order for an individual to be an effective leader, she/he needs to lead from within. In other words, lead by example (Cashman, 1985). This requires competencies such as self motivation, self-regulation and the ability to set one’s own goals.

However, prior to the establishment of self-leadership as a separate construct in the areas of leadership, management and personality theories, there were doubts whether it warranted dedicated study and it was believed to be merely, just another behavioral motivational strategy (Guzzo, 1998). By early 2000, scholarly reservations about its unique value were dispersed following the increase of studies indicating an accelerated need within companies for “knowledge workers”. These were workers with the ability, irrelevant of position, to produce new knowledge, innovation and to act “smartly” in an autonomous way, in a fast-paced and unpredictable environment. This was the start of the third era in the Knowledge Economy, characterized by “the democratization and personalization of work and its focus on heuristic or else known, tacit knowledge” (Tzortzaki, 2011, p.19).

The purpose of this study is to highlight the need for educating young people to become compassionate self-leaders in order to thrive in today’s complex environment and to evolve into compassionate, servant leaders in their local community and workplace. This aim is achieved by providing a case study of a unique undergraduate self-leadership course, taught in a state business school in Greece.

Preliminary evidence of its effectiveness is supplied, through the use of an experimental measuring instrument.

The value and originality of this work mainly lies however, in the proposed conceptual framework of compassionate self-leadership and therefore, compassionate leadership, abbreviated to HEART-led. This framework has served as the course's blueprint over the past six years. More specifically, the majority of the self-leadership models originate in the US, a culture that is quantity, material and task oriented, lacking therefore on aspects that address current social and market trends, such as relationship building, connection, nurture and well-being (Alves *et al.*, 2006). This study therefore, builds upon past conceptual frameworks of self-leadership by highlighting the importance of compassion towards one-self, as the unrivaled road towards effective, compassionate leadership (De Zulueta, 2015). It posits a dynamic new conceptual model, that combines the Goleman-Boyatzis four clusters model of emotional intelligence (EI) (Boyatzis, 2009) and the seminal self-leadership three strategies model, first developed by Anderson and Prussia (1997). With the pivotal addition of the self-compassion element, this framework expands on the positive outcomes of leadership development in the direction of a more qualitative, ecological level.

The first section of this work will provide a brief overview of the self-leadership literature and how it correlates theoretically with EI theory. In the next section there is a discussion on the trends and benefits supporting the need for teaching interventions such as the one showcased herein. The third section covers the methodology of study and the building blocks of the proposed conceptual framework. Finally, the last two sections focus on the study findings, its limitations and conclusions, including suggestions for future research avenues.

Self-leadership Overview

The current theoretical framework broadly defines self-leaders as the individuals that use self-motivation and self-direction in order to achieve desirable outcomes that are part of a higher intention or vision. Self-leadership was initially defined as being linked to three types of strategies: behavioral based strategies, natural reward strategies and constructive thinking strategies (Prussia *et al.*, 1998) and this categorization has been retained years later as a sound model of self-leadership strategies (Mahembe *et al.*, 2013). This, in fact, formed one of the two bases of the proposed conceptual framework.

Behavioral self-leadership strategies are underpinned by the need for individuals to be self-aware and in this way in control of their own behavior, especially in cases of anger or unmet expectations. Behavioral self-leadership strategies are mostly influenced by the self-control theories of the 70s (Moss *et al.*, 2009). Awareness of oneself, also encourages setting ones' own goals and allows for opportunities of self-rewarding in a conscious effort towards self-motivation (Silvia and Duval, 2001). So, even tasks that

conceal high degrees of difficulty and complexity are viewed by self-leaders as challenges and when mistakes inevitably occur, these are savored as learning occasions and not as guilt trips. The re-setting of new goals by the individual under the light of the learnings, ignites an upward spiral of accomplishment.

Natural-reward strategies on their own have their place in the self-leadership construct especially when they occur naturally, simply by the individual valuing each task as an enjoyable experience or in the least being flexible in finding creative ways to complete the task as such, even when it is evidently unpleasant or boring, (Prussia *et al.*, 1998).

The third category of strategies are *constructive thinking strategies* and relate to the high levels of positivity developed by self-leaders, empowering them to transmute a destructive thought pattern into a constructive one. A large number of proposed and tested practices, such as visualization and meditation, have mushroomed over the last two decades in related areas such as mindfulness and positive psychology. Interestingly enough, self-leadership has also been viewed as a process closely correlated to self-efficacy, since the higher the belief in her or his capability to succeed, the higher are her or his confidence levels. This influences the choice of challenges the individual undertakes as well as her or his self-development growth rate (Skaalvika *et al.*, 2015).

Moreover, self-leaders direct themselves in ways of assuming responsibility of their happiness and strive to be in control of their emotions that direct behaviors, thus, closely linking the notion of EI with that of self-leadership. Reciprocally, individuals scoring highly on EI are less influenced by the fluctuations of their emotions and therefore are better at self-observation, self-correcting behaviors, self-motivation and self-goal setting and therefore greater self-leaders (Bishop *et al.*, 2005). The most uncomplicated of EI models, is the “four competency cluster” model and this was chosen as one of the building blocks of the proposed conceptual framework. It includes the competency categories of: self-awareness, self-management, social awareness and relationship management (Boyatzis, 2009).

DISCUSSION

Within the context of the aforementioned Fourth Industrial Revolution and social and economic megatrends, identified by many global watchers such as the OECD (2016) and the World Economic Forum (2018), there is a rise in the people-centered servant leadership style, whose cornerstone is compassion (Amritaswarupananda, 2013, p.59; Dierendonck, 2011). Highly volatile and complex environments, the merging of cultures, lack of privacy, automation, imbalance of natural resources, the knowledge economy, have all lead the more progressive companies to strive for an environment where employees feel that their work is ethical and underpinned by a higher intent of contribution to humanity, that is ecological and that even though they are part of the global community, they are

nevertheless allowed to be self-led and creative. Additionally, increasing pressures on time, the lack of face-to-face communication and exaggerated use of social media, has led to a reduction of employees' EI levels, with a negative impact on self-development and interpersonal skills, such as mindfulness, self-esteem, collaborative ability and managing stress, conflict management, negotiation and mediation (Boyatzis, 2006; Subramanian, 2017).

At such a juncture, this is where compassion comes into play and is much needed, not only in one's personal life but also in a business setting. The Tibetan scholar Thupten Jinpa "defines compassion as having three components: a cognitive component: "I understand you", an affective component: "I feel for you" and a motivational component: "I want to help you". "Compassion" in former CEO of Medtronic's own words is about the transformation of leadership of the "I", to leadership of the "We" (Chade-Meng Tan, 2012, p.199), thus bringing out the best in a leader's followers. Correspondingly, empirical evidence, as well as the practice of top ranking companies and the ecological need for civic engagement at all levels, supports the current trend of servant, compassionate leadership. Companies with compassionate, service led leadership that encourage virtuous attitudes and self-led working methods, based on authenticity, mutual trust and understanding have happier and higher achieving employees (Boyatzis, 2006).

Hence, today's call for compassionate servant leadership, also instigates a need for employees with compassionate self-led qualities. More to the point, there is a shortage of employees that engage in self-directive behavior, which is well rooted first and foremost in self-compassion, since compassion towards oneself is an antecedent of compassion towards others (Yarnell and Neff, 2013).

Concurrently, according to the Global Information Security Workforce Study (2017) there is a mismatch of supply and demand in the job market. Even high technology companies are seeking to find candidates that possess skills that computers do not, and these are communication and analytical, problem solving skills. On the contrary, candidates perceive that what is needed by employers is end of spectrum technical skills. The outcome is a shortage of "knowledge workers". One of the main causes for this mismatch is the gap between education (supply) and the job market (demand), (OECD, 2017).

The question worth exploring at this point is whether self-leadership is a behavior that can be cultivated at a young age through classroom interventions. In a similar fashion recent advances in self-regulation strategies have shown that these can be nurtured in the workplace environment by introducing effective managers as role models and by specialized training programmes (Stewart *et al.*, 1996; Moss *et al.*, 2009). A seminal field study carried out by Neck and Manz (1996), demonstrated the significantly positive effect of mental imagery on achieving goals and that individuals can be successfully taught how to follow constructive thought pattern strategies, which as mentioned earlier are one of the three main strategy constructs of self-leadership theory.

Although the benefits of increasing the ability of young adults or even children to be self-led are evident, a brief overview of these will be outlined below highlighting the importance of such interventions. In the age of high speed technology, information overload and growing numbers of youth suffering from attention deficit syndrome, memory loss and weak interpersonal skills, the behavioral aspect of self-leadership strategies encourages self-observation, i.e. one being aware of oneself, therefore increasing one's volition and ability to focus and achieve goals (Forstmeier and Rüdell, 2008). Moreover, self-leadership lessens the chances of breakdowns from emotional or physical exhaustion regimes to which younger adults are more prone towards, as it increases mindfulness in relating to others and mindfulness of one's body and its needs. Most importantly however, at a macro socio-economic level or even at a human existential level, the case of the empowerment of young adults through self-leadership programs is imperative. This is even more urgent, considering all the challenges that lie ahead of us and the lack of true leaders (Boulter, 2005, p.182).

The industry-education connection response to the mismatch mentioned above and the need for the development of self-leadership skills in young adults, although studied by the academic world for more than two decades, has manifested in the form of training interventions mostly in private settings. There are very few examples scattered amongst state institutions and these mainly in the form of leadership programs for undergraduate students. A review of such leadership programs has shown that the area of teaching young adults self-leadership in a higher education setting is a path less travelled (Karagianni and Montgomery, 2017).

The self-leadership course presented in this study was developed as an offshoot of a first year management course, taught to students in the School of Management and Economics at the state-owned, Hellenic Mediterranean University (former TEI of Crete), based in Greece. Apart from the above arguments in support for the development of such a course the following five realizations and principal values emerge:

1. One cannot be an effective manager without being first and foremost effective at self-management. The available academic textbooks on management lacked such an approach.
2. From an ecological viewpoint the world desperately requires compassionate leaders and less so, effective managers. Moreover, as with effective management, a prerequisite of compassionate leadership is a highly developed ability for self-leadership and self-compassion.
3. The majority of the young adults in these courses lacked self-esteem, had low self-efficacy and therefore generally adopted a pessimistic view of life and their prospects. Consequently, as also supported by self-efficacy theories (Prussia *et al.*, 1998), their goal setting skills, motivation levels and success rates were, in the majority of cases, low.

4. Although employers seek to recruit “ready to run” employees, that are fully competent in interpersonal and creative complex problem solving skills, the education provided from early school years to higher education, lacks the teaching of skills for life (Hannam, 2018).

5. The role of a teacher, especially in the realm of social studies, is not only to transfer cognitive knowledge, but also to instill humanitarian values, in tune with ecology and to facilitate the development of responsible self-led adults who can become leaders in any setting.

METHODOLOGY

The course in this case study is a final year elective and has a duration of one semester, four hours each week. With no prior model to follow, the course was initially designed based on the “four cluster” model of EI competencies (Boyatzis, 2009) and was focused on increasing the awareness of the need of developing soft skills and an awareness of emotions and the benefits of regulating them (Gear *et al.*, 2017). Now, six years later, the course syllabus has expanded. Its focus has been elevated to training young students to become compassionate self-leaders and in turn successful, compassionate, servant leaders in their chosen path. The following figure (Fig.1), reflects the blueprint that underpins the course structure and adds value to this study, as it introduces the HEART-led model as a new conceptual framework for developing compassionate leaders.

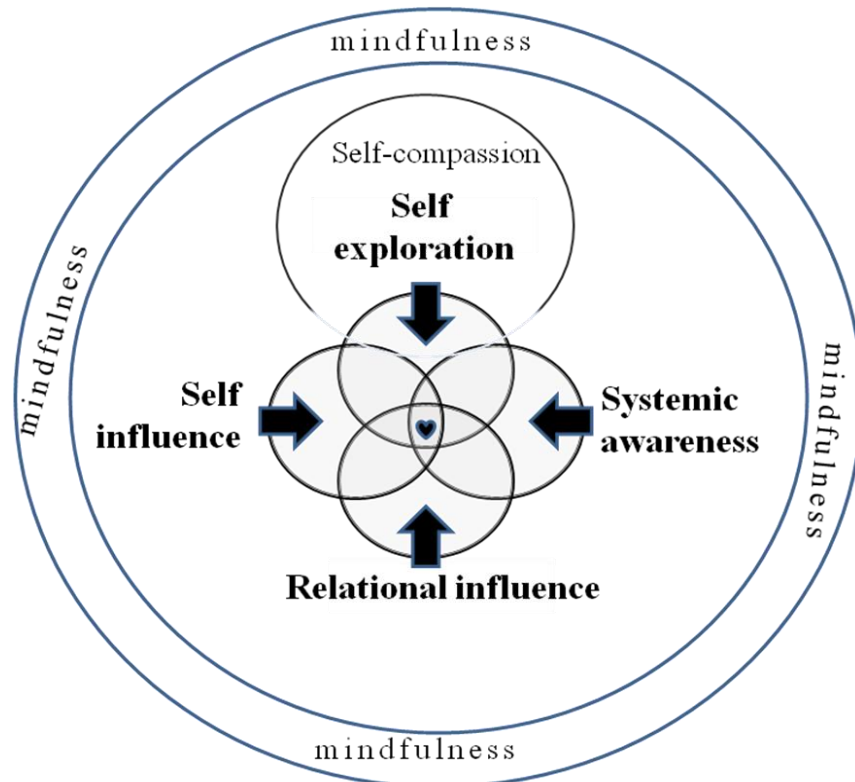

Figure 1. “HEART-LED”, A NEW COMPASSIONATE LEADERSHIP CONCEPTUAL FRAMEWORK
(SOURCE: AUTHOR’S OWN)

The framework suggests that for a leader to be compassionate, she or he needs to develop and work towards mastering four interlinking competencies: self-exploration, self-influence towards authenticity, systemic awareness (including micro and macro environmental awareness) and relational influence towards resonance. All four elements are of a normative, mobile nature, since besides being goals, they also prescribe a strategy and a direction. Moreover, unlike other leadership models, the linchpin of the HEART-led model, is self-compassion. A leader cannot behave compassionately towards others, unless she or he cultivates self-compassion, especially during moments of self-exploration (De Zulueta, 2015). The all pervading and ever present “mindfulness attitude” of a leader, is also a necessary prerequisite and goal to work towards (Amritaswarupananda, 2013).

The key difference of the Goleman-Boyatzis “four clusters” EI model and the one proposed here, is that the EI model is descriptive and static, whereas the current one is dynamic and lays down strategies. In addition, the HEART-led model includes self-contemplation strategies, such as: discovering limiting beliefs and transmuting them into empowering beliefs; the accurate gauging of performance expectations; the integration of systemic and analytical thinking for re-framing situations and deciding with discernment.

The second building block of HEART-led, was the Anderson-Prussia “three self-leadership strategies” model. The new framework, merges the natural-reward strategies into the behavior-focused strategies and adds new strategy categories under the main heading of “self-exploration”. This self-discovery journey relates to the workings of the subconscious mind and aims to improve confidence and self-efficacy levels. It involves the evaluation of reality, the cultivation of resilience and also many other elements that are relationship focused, which were missing from the Anderson-Prussia model, such as non-violent communication strategies, building rapport, e.t.c.

In the main, the HEART-led model builds on the two founding models and reinforces the importance of compassion and mindfulness in modern day leadership.

Course evaluation

The course is constantly improved using two measures: an end of semester evaluation questionnaire and a pre and post compassionate self-leadership questionnaire (the HEART-led questionnaire). Both measures are completed by the students anonymously. The evaluation questionnaire is qualitative and measures their degree of satisfaction against expectations and outcomes and their perception of self-improvement and self-worth levels.

During the initial course design the need for a student specific self-leadership skills development measurement scale became apparent, since most of the participants had little or no job experience. The original self-leadership questionnaire reflected a scale measuring the level of each student’s EI competency. At the time of using the measurement scale tool for this study, the scale had already

expanded by including additional constructs based on self-development theory (Houghton and Neck, 2002) and indicators measuring self-compassion levels. This tool has now been named the HEART-led questionnaire. It currently includes 40 items, with a 1 to 5 Likert style questions. It is still in need of further development and testing, nevertheless preliminary findings are presented below from using the pre and post questionnaire on 78 participants.

RESULTS

A paired samples t-test was conducted to compare the total scores of compassionate self-leadership levels of the 78 course participants at the beginning of the course and their scores at the end of the course. The test showed that there was a significant difference in the scores for the beginning ($M=141.15$, $SD= 13.276$) and the scores at the end ($M= 166.24$, $SD= 15.817$) of the course, with $t(77)= -19.911$, $p=0.000$. Even at a 1% significance level, the score mean at the end of the course is bigger than the score mean at the beginning.

Specifically, findings suggest that when students take such a course their level of compassionate self-leadership could potentially improve, by at least 17%. These are only preliminary results and require a more in-depth analysis. Nevertheless, these initial outcomes suggest that an intervention such as this may have a positive effect on the participants' level of self-leadership.

The findings of the course evaluation questionnaire are used every year as a feedback and course improvement mechanism. The program of study currently reflects the four constructs of self-leadership of the HEART-led model and is constantly enriched, based on the evaluation and suggestions of the students themselves, the job market trends and what is ecologically sound. It has now expanded to include areas such as: exploring varying styles of internal and external representation of the world, positive self-talk, the purposeful use of language, non-violent communication principles, Way of Council (communication circles with a talking piece), intrinsic goal setting, work, social and personal life balance, seeking life purpose, the importance of ecology and harmony, the interconnectedness of the world we live in, visualization techniques for attracting desired outcomes, courageous authentic living based on one's values and societal contribution, successful career progression with a focus on fulfillment and happiness.

Additionally, research has shown that younger people are more prone to adopt self-leadership behaviors than older ones (Kazan and Earnest, 2000), particularly those belonging to generation Y who favor interactive, participative learning methodology (Hannam, 2001; Gilliespie, 2016). This is constantly being confirmed by the course evaluation results. Therefore, the course has been developed to be of a highly experiential nature with case studies, personal journal writing for exploration of Self, 'presentation of Self' exercises ("who Am I and what Am I?"), role play exercises, group and pair

classroom exercises, personal learning agendas, mindfulness meditation and expanded awareness practices, designing a CV and job seeking strategies for a fulfilling career. Finally, “play” is an intrinsic part of the course’s learning process, since empirical studies have shown that individuals learn better when having fun.

CONCLUSIONS

The current study has limitations especially with regard to the brevity of the HEART-led model description and the HEART-led measurement tool. The tool is currently being tested for construct validity and a more in-depth statistical analysis of the existing results is being undertaken, as this is a preliminary study and is still evolving. These limitations should not, however, deflect from the fact that the conceptualization of the HEART-led model represents a first attempt to introduce the pivotal importance of self-compassion in the development of effective compassionate leaders. Moreover, the HEART-led measuring tool is in itself a useful foundation for the construction of a scale that measures the effectiveness of compassionate leadership training interventions, especially those of young people with little or no prior work experience.

Apart from the innate self-leadership abilities, there are also abilities that can be learned and developed into competencies. The review of self-leadership literature, as also the findings from this exploratory study, suggest that self-leadership training courses can positively affect the ability of an individual to become a self-leader.

Self-leadership theory demonstrates the positive relationship between an effective modern-day leader and also its positive impact on personal excellence. This study makes a strong argument for the instrumental role of self-compassion in sustaining a leader’s compassionate, servant approach in the long-term and for the need of more compassionate leaders in today’s materialistic cultures.

Moreover, under the light of learning interventions such as the one presented herein, leadership can be viewed as an inclusive process, allowing for all to be leaders in their own right and for the authentic expression of oneself. The impact of such thinking can have a constructive effect on next generations being able to cope with the challenges that lie ahead. This is in harmony with Gandhi’s philosophy “Be the change you wish to see in the world” and Aristotle’s “virtuous citizen”, both of which encourage further civic engagement.

ACKNOWLEDGEMENTS

I am truly grateful to all my students that for more than twelve years were also my best teachers and to Dr. Andreas Toupadakis for his input and support in writing this paper.

AFRICA AND THE INTERNATIONAL CRIMINAL COURT JUSTICE DEFERRED OR DENIED?

Van Der Bank, C.M.

Vaal University of Technology, South Africa

ABSTRACT

Established in 2002, the ICC is a permanent court to try individuals who commit the world's most serious crimes: genocide, war crimes and crimes against humanity. The ICC is a court of last resort and not a court of first instance. Several African states and the African union have criticized the indictments citing that the Court seems to be overly concentrating its efforts on the African continent. Factors such as the limitations imposed on the Court's jurisdiction and the lack of domestic or regional alternatives for prosecuting crimes against humanity. This article traced the origin of African dissent against the ICC and examined its implications on justice for victims, international law, as well as the future of the Court.

Keywords: Accountability, ICC, crimes against humanity and justice.

CONTEXTUALISING THE INTERNATIONAL CRIMINAL COURT

On 17 July 1998, one hundred and twenty states adopted the Rome Statute, which established the International Criminal Court (Roman Statute of the International Criminal Court, 1998). One-third are from the African nations, and the continent's delegates and representatives have historically played an important role both in drafting the statute and developing the judicial institution. The ICC is the first permanent international criminal court whose main aim is to ensure accountability for perpetrators of the most serious crimes of international concern. The Court is participating in a global fight to end impunity, and through international criminal justice it aims to hold those responsible accountable for their crimes and to help prevent them from happening again. Detailed consideration is given to the history of war crime trials and their place in the system of international law, the legal and political significance of a permanent ICC, the legality and legitimacy of war crime trials, the tensions and conflicts involved in negotiating the ICC Statute, the general principles of legality, the scope of defences, evidential dilemmas, the perspective of victims, the nature and scope of the offences within the ICC's jurisdiction – aggression, genocide, war crimes, crimes against humanity, questions of admissibility and theories of jurisdiction, the principle of complementarity, national implementation of the Statute in a range of jurisdictions, and national and international responses to the ICC. The creation of the Court was primarily embraced in Africa because most states had and continue to

experience atrocious crimes; for example, the Rwandan genocides of 1994, which resulted in almost one million deaths (Eltringham, 2004). It was inevitable that forty-seven states participated in the drafting process of the Roman Statute, and the majority approved its adoption (Murithi, 2013). The ICC will only exercise jurisdiction where a state is unable or unwilling to genuinely investigate and prosecute persons accused of committing such crimes. This paper blends detailed legal analysis with practical and policy perspectives and offers an authoritative complement to the extensive commentaries on the ICC Statute. The method that will be used is legislation, reviews of articles and analysis of international law instruments and reports on the ICC.

In this article the role of the ICC will be analysed in creating accountability for atrocities in Africa. The ICC is a very important avenue for ensuring accountability and justice for serious crimes in Africa. The method that will be used is legislation, reviews of articles and analysis of international law instruments and reports on the ICC.

IS THE INTERNATIONAL CRIMINAL COURT TARGETING AFRICA INAPPROPRIATELY?

In the first ten years of the ICC, all investigations and prosecutions have been concerned with situations in Africa. Since its establishment in 2002, the International Criminal Court has heard 22 cases and designated 36 individuals, all of them from Africa (Kariuki, A, 2015) Most of the investigations relate to situations in Africa, namely, the Democratic Republic of Congo, Uganda, the Central African Republic, Dafur/Sudan, Kenya, Libya, Ivory Coast and Mali (ICC Forum, March 2013-January 2014).

Instead of asking whether Africa's targeting is unfair or justified, we need to ask: "Why Africa?" One reason may be that the Office of the Prosecutor has only opened investigations in Africa, and many situations of concern simply do not fall within the ICC jurisdiction.

There may be a good reason for this. It could be that many situations of concern do not fall within the International Criminal Court's jurisdiction (ICC Forum, March 2013-January 2014). The mandate as set out in the Rome Statute only allow crimes committed after July 2002 and its subject matter jurisdiction is limited to war crimes, crimes against humanity and genocide. The International Criminal Court is only a court of last resort for countries that are either unable or unwilling to try suspects themselves. Jean Ping, the former AU Commissioner, told the media that African countries are against Ocampo who is rendering justice with double standards (Lough, 2011), and believes that the ICC is designed to target Africa. He summed it up in his recent exclamation: Why not Myanmar? Why not Iraq?" (Kariuki M, March 12, 2015). Ping's question has an answer: Myanmar is not part of the ICC, and the Court is indeed targeting countries like Iraq. Iraq is not part to the Rome Statute and

the Court is in the process of conducting a preliminary examination to determine whether there is a reasonable basis for it to proceed further with its investigation.

THE ICC'S OUTREACH AND COLLABORATION IN AFRICA: THE NEED FOR COOPERATION

There is a two-way communication between the ICC and the situation countries which are subject to the ICC's investigations and proceedings. Article 86 of the Rome Statute obliges Parties to cooperate with the ICC in its investigations and prosecution of cases.

Omar al-Bashir is the current President of the Republic of North Sudan since its independence in 2011. The Sudanese government has declined to surrender its nationals, including its president, Al-Bashir, whose arrest warrants are pending. He has continued to bluntly defy summons to appear before the ICC or answer the charges against him (UNSC Res, 1593). Al-Bashir's latest act of defiance was his travel to Rwanda in March 2018 to attend the African Union Summit despite a warrant out of his arrest by the ICC (AfricaNews, 2018).

The ICC has repeatedly requested for cooperation from African member states to arrest al-Bashir should he travel out of Sudan to a country which is signatory to the Rome Statute. African leaders have repeatedly scoffed at the ICC's directives to arrest the Sudanese leader; for instance, in March 2018 at the AU Trade Summit, Rwanda joins a long list of African countries that have defied the request of the ICC to arrest and hand the infamous president over to the court for prosecution (AfricaNews, 2018). Most cases were about the Court's failures in handling the case, accusing it of basing its evidence on hearsay rather than conducting a serious investigation (Kaiuki, A; 2015).

Kenya has paid lip service to cooperation with the ICC to avoid it from prosecuting its citizens. It has nevertheless established an ICC field office in Kenya to assist in the investigation of cases currently before the Court. In the absence of an international police force willing to arrest alleged perpetrators, the ICC continues to rely on the goodwill of its state parties and other inter-governmental organisations to function effectively.

PROSECUTION OF AFRICAN LEADERS IN THE ICC

There is the sense that the ICC is being utilised in a politically motivated fashion to pursue opponents of governments (Murithi, T and Ngari, A: 2011). Although the parties may not agree on the process, the outcome is owned by all the parties, which allows them the confidence to return to the table for further and better outcomes. Justice cannot be achieved without the aggrieved having the right to be heard. The ICC will only exercise jurisdiction where a state is unable or unwilling to

genuinely investigate and prosecute persons accused of committing such crimes. It is therefore important to briefly examine some of the most contentious indictments of African leaders by the ICC.

Kenya

President Uhuru Kenyatta of Kenya became the first sitting Head of State to be subjected to the jurisdiction of the ICC on charges of crimes against humanity, which he strongly denied (Bowcott, 2014). He was indicted on five counts of his alleged role in unleashing a wave of post-election violence during 2007-2008 that left 1 200 people dead and 600 000 displaced (The Prosecutor v Uhuru, 2015). Kenyatta handed over his power to his deputy, William Ruto before flying to The Hague in Holland (Bowcott, 2014). The President invoked Article 147(3) of the Constitution of Kenya, which provides that in cases where the President is absent or temporarily incapacitated, and in cases where the President so decides, the Deputy President shall act as President. The President will then be able to answer to the charges against him in his personal capacity and not as the Head of State. To highlight how seriously the President wanted the transfer of power to be understood, after announcing his intention in Parliament, he went to Harambee House where he signed the relevant papers and symbolically handed Ruto his symbols of power, signified largely by the presidential motorcade (Mosoku, 2014). Kenya's President, Uhuru Kenyatta has become the first sitting head of state to appear before the International Criminal Court in The Hague faced with charges of crimes against humanity over his role in the violence that followed the 2007 elections in Kenya. However, he says the charges against him are politically motivated and insists that the case should be thrown out (Holligan, 2014).

The case against President Kenyatta was postponed several times while the prosecutor attempted to build the case against him (Deutsche Welle, 2016). Despite the case against Kenyatta being dropped, the court's statement highlighted "the relevance of the materials sought... to current or future investigations." It also warned that any similar lack of cooperation could have a "serious impact on the functioning of the court in future proceedings." Under ICC rules founded by the Rome Statute, which 124 countries have signed up to, all states are required to cooperate fully with ICC investigations and prosecutions (Deutsche Welle, 2016). President Kenyatta's case is significant in that it showed a level of willingness of an African leader to cooperate with the ICC regardless of the allegations of non-cooperation. On several occasions, Kenyatta showed his displeasure and accused the ICC court of biasness towards African States.

Sudan

On 16 October 1993, al-Bashir appointed himself "President" and disbanded the Revolutionary Command Council. The executive and legislative powers of the council were taken by al-Bashir. Sudan's President Omar Hassan al-Bashir did not appear before the ICC after several summons. Al-Bashir's latest act of defiance was his travel to Rwanda in March 2018 to attend the African Union

Trade Summit despite a warrant out for his arrest by the ICC (AfricaNews, 2018). The warrant details ten charges, which include five counts of crimes against humanity, two counts of war crimes and three counts of genocide (The Prosecutor v Omar Hassan Ahmad al-Bashir, 2010).

The ICC did not receive any cooperation from several African states, even South Africa. The ICC found South Africa had failed in its duty to arrest Sudanese President Omar al-Bashir when he was in the country (News 24, 2017) attending an African Union summit in Johannesburg in June 2015. By failing to arrest al-Bashir, the court's ruling stated that South Africa had failed to honour its obligations under international law. For the failure to arrest al-Bashir in March 2018 at the AU Trade Summit, Rwanda joins a long list of African countries that have defied the request of the ICC to arrest and hand over to the Court for prosecutions (AfricaNews, 2018).

Africa's defiance against presidential-Bashir's arrest warrant begun in July 2009 at the thirteenth AU Heads of State summit in Libya where African leaders made a commitment not to arrest and extradite President al-Bashir of Sudan to the ICC whenever he travelled to their territories (Abdulai, 2010). The disproportionality lamented by African leaders is primarily driven by limitations on the ICC'S jurisdiction and the lack of alternative judicial pathways in Africa (Kariuki, 2015). Al-Bashir has visited several African states with the confidence that he would not be arrested. This confidence arose by the assurance that most African leaders share in the sentiment that the Court has ceased to be an independent and impartial forum.

Chad and Uganda hosted al-Bashir in May and July 2016 even after being referred to the Council. Al-Bashir also visited Russia, which is not a party to the ICC. Al-Bashir was indicted on three counts of genocide, meaning that he intended to destroy in part the Fur, Masalit and Zaghawa ethnic groups. He has survived longer than any other post-colonial Sudanese head of state.

On 29 March 2017 the Kingdom of Jordan also declined to arrest al-Bashir when he visited the State for the twenty-eight Arab League Summit Meeting in Amman.

Libya

Libya is not a state party to the Rome Statute, although the United Nations Security Council referred the situation in Libya to the ICC to investigate alleged crimes against humanity following the outbreak of popular demonstrations against the regime of M Gaddafi in February 2011. The UN Security Council has also failed to provide the necessary support for the ICC investigation. Civil society continues to call for accountability for widespread crimes afflicting the country, including those through Rome Statute ratification and implementation.

Uganda

The Republic of Uganda signed the Rome Statute in 1999 and later in 2002 deposited its instrument ratifying the treaty. This signing and ratifying of the Rome Statute demonstrated Uganda's

commitment and submission to the authority of the Court, and the obligations imposed by the Rome Statute. Uganda has a campaign of resistance fought by the Acholi-dominated Uganda People's Democratic Army (UPDA), the Allied Democratic Forces (ADF) and the Lord's Resistance Army (LRA) (Doom and Vlassenroot, 1999). The Ugandan government referred the situation to the Court in 2003 by a letter from President Yoweri Museveni to the prosecutor of the ICC, Luis Moreno Ocampo. The question to ask then is why would these very states compromise their commitments in defence of their peers who are accused of committing these crimes?

President Museveni also joined the regiment of African leaders opposing the authority of the ICC in African states (Hanson, 2008). The Court has four outstanding arrest warrants for top-level members of the Lord's Resistance Army including their leader Joseph Kony. The ICC does not have the power to arrest these four persons: such arrests are the responsibility of state parties. Museveni's biggest defiance against the ICC was perhaps during his own inauguration in May 2016, which was also attended by Sudanese President al-Bashir who is still wanted by the Court (The Prosecutor v Omar Hassan Ahmad Al Bashir, 2010). The Ugandan President referred to the ICC as a bunch of useless people who had lost his support completely (Associated Press).

Democratic Republic of the Congo

In March 2006 Thomas Lubanga Dyilo was surrendered to the Court by the Congolese government after a February warrant for his arrest. His trial was set to begin in June 2008 but has been delayed because ICC judges determined the prosecution had withheld evidence from the defence. The sheer horror of the conflict in Congo may not be enough to trigger international prosecutions by the ICC. There is a decidedly idealistic tone that both underpins and animates the movement for international justice. Unfortunately, the reality is pocked with competing interests and constituencies. In determining its potential role in the conflict in the Democratic Republic of Congo, the Office of the Prosecutor of the ICC must consider the stability of the country's government, the future of its national justice system, the ramifications of unequal justice for victims of the entire war, the feasibility of successful prosecutions, whether or not Ituri is the appropriate conflict with which the Court should begin its institutional life, and so on. It is impossible for the ICC to avoid these difficult questions.

WHAT IS THE US POSITION ON THE ICC?

Initially the US opposed the ICC out of fear because it thought it would be used for politically motivated prosecutions of US personnel abroad, but of late it is softening its stance on the Court. When the Security Council voted to refer the issue of Dafur to the ICC in March 2005, the United States abstained rather than vetoing the referral.

The US position is still ambivalent, but this does not mean that the United States has turned the corner to seek out ways to cooperate with the Court. US legislations continue to penalise countries that are signatories to the Rome Statute.

The United States government has consistently opposed an international court that could hold US military and political leaders to a uniform global standard of justice. The Clinton administration participated actively in negotiations towards the International Criminal Court treaty, seeking Security Council screening of cases. The Bush administration, coming into office in 2001 as the Court neared implementation, adopted an extremely active opposition. Washington began to negotiate bilateral agreements with other countries, insuring immunity of US nationals from prosecution by the Court. As leverage, Washington threatened termination of economic aid, withdrawal of military assistance, and other painful measures. The Obama administration has so far made greater efforts to engage with the Court. It is participating with the Court's governing bodies and providing support for the its ongoing prosecutions. Washington, however, has no intention to join the ICC, due to its concern about possible charges against US nationals. The Trump administration takes a tough stance against The International Criminal Court (Eyewitness news, 2018). The US will not cooperate with the ICC and will not provide any assistance to the ICC. The Trump administration even threatened tough action against the International Criminal Court should it try to prosecute Americans for alleged war crimes in Afghanistan (Word News, September 2018).

AFRICAN UNION TO WITHDRAW FROM ICC

Africa has a rocky relationship with the ICC, which plays right into the rhetoric that the Court is targeting Africans and is being used as a tool for the enforcement of neo-colonialism by Western powers (Kasande et al., 2017). Several African leaders feel that the Court abused its powers by pushing self-serving agendas like unconstitutional regime change (Hatcher, 2013). Nine African leaders have been charged in the ICC for various crimes.

Several African leaders have argued that the ICC has digressed from its original mandate of ensuring accountability and justice for the most serious crimes under international law, to a political tool used by the West to promote a neo-colonial agenda (Kasande, et al., 2017). The AU has also accused the Court of breaking international law, saying that by investigating sitting heads of African states it has failed to respect political figures' guarantees of immunity from prosecution. The international immunity laws stem from an understanding that while in office, state officials fulfil critical executives' duties and that undergoing prosecution for criminal offenses could hinder their performance (Kariuki, 2015). Many of the African cases investigated by the ICC were referred to the Court by the governments of these countries themselves. The procedures of the ICC require that

justice be a two-way street: when the international community or even a country's own government asks for international aid in bringing justice, the ICC has a heavy responsibility to take action. The ICC has invoked its own jurisdiction in only one situation. Other situations have all come to the Court through referrals from the states concerned and the Security Council. Moreover, the ICC has declined to investigate only two situations outside of Africa. This small number of decisions provide an insufficient basis to conclude that the ICC is discriminating in its selection practices.

SOUTH AFRICA'S FAILED WITHDRAWAL FROM ICC

South Africa's fall out with the ICC came in June 2015 when the Sudanese President Omar al-Bashir who is wanted by the Court on charges of crimes against humanity attended an African union summit meeting in Johannesburg (Mills, 2012).

Upon his arrival in South Africa, the South African Litigation Centre instituted proceedings in the High Court Gauteng Division seeking an order preventing Bashir's exit and effecting of his warrant of arrest (Southern Africa Litigation Centre v Minister of Justice, 2015). The High Court ordered that President al-Bashir was prohibited from exiting South Africa pending its final decision. Immediately after pronouncing its order, the High Court was informed by government counsel that al-Bashir had left the country earlier that day. President Jacob Zuma justified his government's action stating that the arrest of al-Bashir was tantamount to illegitimate regime change in Sudan (Tladi, 2015). Notwithstanding this consideration, the ICC ruled that South Africa had failed in its duty to arrest al-Bashir and extradite him to The Hague for prosecution. South Africa did not face any sanction for failing to arrest the Sudanese President, and expressed its intention to withdraw from the ICC (Fabricius, 2017). Moreover, the government followed up its intention by tabling a bill in parliament seeking to repeal the Rome Statute of the ICC, which would effectively withdraw from the ICC. South Africa's Minister of Justice and Correctional Services withdrew the bill in accordance with Rule 334. The South African situation is an account of a failed attempt aimed at liberating itself from the authority of the ICC.

IS THE ICC TARGETING AFRICA? AFRICA AND THE INTERNATIONAL CRIMINAL COURT - JUSTICE SHOULD PREVAIL

The disproportionality lamented by African leaders is primarily driven by limitations on the ICC's jurisdiction and the lack of alternative judicial pathways in Africa. The ICC focus on Africa is neither legally nor morally inappropriate but nonetheless threatens to undermine perceptions of the Court's fairness.

In assessing the work of the ICC, one must devise a benchmark against which to measure it. It is unclear what standard should be used as the ICC is a *sui generis* institution that had to be built from the ground up within the context of ongoing conflicts that demand immediate attention while sharing some similarities to the practices and staff representing divergent legal philosophies, traditions and practices.

The bottom-line is that the world's tolerance for totalitarian regimes is wearing thin. A leader who attempts to govern his nation on autocratic terms automatically becomes unpopular within his own country and the international community at large. Human rights embrace the principles of democracy, constitutionalism, separation of powers and rule of law, which all seek to eliminate the likelihood of the abuse of power. International crimes are mostly perpetrated by powerful and seemingly untouchable state officials who are not normally prosecuted for their roles in such atrocities (Akande and Shah, 2010). Failure to ensure accountability for such violations leads to a detestable cycle of impunity.

Critics accused the ICC of acting immorally by discriminating against Africa and Africans in deciding which situations to investigate and prosecute. The evidentiary basis for such claims is weak. The ICC has invoked its own jurisdiction in only one situation. The other situations have all come to the Court for referrals from the states concerned and the Security Council. The ICC has declined to investigate only two situations outside Africa.

CONCLUSION

African leaders therefore have an obligation to ensure that any person who perpetrates international crimes, head of state or not, must be held accountable for those atrocities. Africans deserve justice and in cases where a state fails to prosecute a perpetrator of international crimes, the ICC offers a forum under which such proceedings may be conducted.

The role of the ICC is to create accountability for atrocities in Africa. This is essentially a legal claim. The ICC fail to respect international law governing head of state immunity, which they claim prohibits prosecution of head of state, even for international crimes. They assert that the ICC is not respecting the principle of complementarity which prohibits the Court from investigating or prosecuting cases when a state with jurisdiction is doing so in good faith.

The strongest argument that the ICC exclusively focuses on Africa is inappropriate and a sociological one. Substantial evidence suggests that perceptions of the ICC 's fairness have suffered in at least some African audiences because of the focus on Africa. It is unclear whether such perceptions are located primarily at the governmental level or are shared widely among African populations. It

concluded that although the ICC has its deficiencies, it remains a very important avenue for ensuring accountability and justice for serious crimes in Africa.

If African leaders harbour grievances with the court's methods of operation or are unsatisfied by the ICC's adequacies, it is incumbent upon them to champion reform on the areas of concern through the appropriate channels. To quit the court altogether does nothing for victims but promotes impunity of perpetrators for international crimes, which is highly desirable. Ultimately, victims of international crimes still need justice, which to this end has been provided by international tribunals such as the ICC, regardless of its shortcomings. Psalm 94:15 reads, "for justice will prevail and all the morally upright will be vindicated" (Bible).

STRATEGY-MAKING BY ANSWERING 49 QUESTIONS: A NOVEL PROCESS-BASED PRACTICE MODEL

Van Straten, Roeland

University of Twente, The Netherlands

ABSTRACT

Strategic thinking does not only concern *what* to decide, but also *how* to decide. A new processual model for strategy-making is presented and legitimized through systems theory, state of the art strategy literature, as well as many years of practical strategizing. The purpose of the model is to aid in improving the quality of firms' strategic decisions by enhancing rigor. To this end, the model guides (aspiring) strategists through 'empirical', 'sensemaking', and 'envisioning' phases by inviting them to systematically produce 49 logically identified pieces of knowledge, in order to reach seven knowledge milestones. It is argued that if firms use this epistemic tool well, they can inject more discipline, logic and justification into their strategy-making processes, thereby increasing the likelihood of reaching desirable outcomes. Future research could seek to compare the quality of the strategic decisions made with the tool to those made without it.

Keywords: Strategizing, Decision making, Strategic cognition, Sense making

INTRODUCTION

According to Jarzabkowski and Wilson (Jarzabkowski & Wilson, 2006; Wilson & Jarzabkowski, 2004), strategy practice is in something of a crisis; the increased rate of change in contemporary business environments makes theoretical strategy knowledge increasingly irrelevant. Whether true or not, when the aim is to identify guidelines for improving firm performance, a nomothetic view of causation must be rejected. The causality that concerns practitioners – what to do in a particular situation, to achieve a particular goal – is typically not included in statements offered by contingency models (Sandberg & Tsoukas, 2011). A practicing strategist is not looking for a *contingent* theory that is dependent on a domain, but for a specific theory, *given* a domain.

The inability of past strategy theory to adequately guide the practical strategist does not mean, however, that practice makes perfect. Scholars rightfully warn strategy practitioners and educators about embracing simple solutions stemming from glib presumptions (Augier & March, 2007). Moreover, many widely used analytical tools like Porter's Five Forces model (Porter, 2008) point to a very narrow subset of potential resolutions or opportunities.

To a large extent, the gap between strategy theory and practice stems from the fact that the firm is not 'out there' to be discovered as a coherent whole. A firm can only be known through observable data, and therefore constitutes something that is "found and made, discovered and invented" (Wright, Paroutis, & Blettner, 2013, p. 119). None of this means that history no longer matters; thinking must be informed by past observations. However, knowledge that is derived from the past is less and less usable in a deterministic way (Vaara & Lamberg, 2016). It makes that the challenge for a firm is no longer selecting a strategy, but creating a flexible organization that is able to continually redefine strategy based on a dynamic and holistic perspective of the firm and its environment (Fowler, 2003; Porter, 1991). This, in turn, means local-search processes become much more important (Raelin & Coghlan, 2006). Moreover, some evidence already suggests that the training of strategists to systematically search complex decision environments is an important way forward to improve strategic decision making (Gary, Wood, & Pillinger, 2012). Such search processes are difficult, however, and might even be impossible without access to solid intellectual tools or epistemic objects (Fowler, 2003). Hence, (aspiring) strategists may welcome devices that can aid in making sense of all available data (Molina-Azorín, 2014), especially ones that reflect generic theories of *what* to search for and *how* to do this. Indeed, a process-type outline on *how to go about* strategic thinking in practice is required.

SYSTEMS THINKING, SENSEMAKING, ENVISIONING, AND ARTICULATION

It is posited here that the possibility of acquiring true knowledge about a business environment is dependent on the way a strategist collects, organizes, and interprets information. As such, strategists are posed here not as knowers, but as self-consciousness and self-directing learners who want to counter naive or false beliefs, and who are intrinsically motivated to acquire, create, and apply new knowledge (De Déa Roglio & Light, 2009; Rousseau, 2012).

When thinking then becomes *firm-specific* and *strategic* thinking, a strategist would benefit from adopting a *systems thinking* lens. Systems thinking means one tries to gain an understanding of how a system works first, adopt or develop a mental model next, and finally prepare for strategic decision making (Spender, 1996). The mental model view acknowledges that strategizing exists in people's minds and in their views about the world and their firm's place in it (Gavetti & Rivkin, 2007). Additionally, if perceptions and ensuing interpretations form the bases for decisions and argumentation, and therefore ultimately also for actions (Narayanan, Zane, & Kemmerer, 2011), then strategists must also learn how to *express* these beliefs.

Acknowledging that better decision making depends on having superior mental models, and that we think in words, means Herbert Simon's "preferred world" (Rousseau, 2012, p. 604) is dependent on the making of better firm-specific propositional statements. When this idea is embraced, it can be argued a new model that aims to prepare for better strategy-making would need to provide an outline on *how to describe* a firm, both normatively (what is a proper description?) and procedurally (how should these proper descriptions be formed?).

Logically, such a model would first need to guide the strategist through an 'empirical' phase to gather firm-specific content and establish an empirically justified basis for further statement making. This phase should not be aimed at trying to form a mental model of a firm's entire business environment, but a mental depiction of what, according to, is the observable *interdependence representation* of a firm's environment (Martignoni, Menon, & Siggelkow, 2016). Subsequently, such a model must guide the strategist through a 'sensemaking' phase in which all gathered but still disparate facts, information, and interpretations are assembled into what Brown and Thompson (2013, p. 1148) call an "ordered universe of meaning". This second phase is thus aimed at ascribing *relevant meaning* to the empirically based statements made in the preceding phase. The goal of this phase is to establish a practical, value-creating theory for a firm. This echoes what (Martignoni et al., 2016) call *performance representation*.

Finally, such a model must guide a strategist through an 'envisioning' phase, in which all information and subsequent sensemaking is synthesized into a coherent set of forward-looking beliefs that enable strategic judgment. To transition from sensemaking to envisioning enables a differentiation between being *knowledgeable* and being *wise*. A knowledgeable person is one who holds justified true beliefs that are supported by facts and arguments, while a wise person is able to demonstrate sound and serene judgment by applying this knowledge (Kessler, 2006).

A NEW PRACTICE MODEL FOR FIRM-SPECIFIC STRATEGY MAKING

Based on the above, a new model is proposed that is best characterized as an analytic-philosophical system. Its development rests upon a foundation of axioms regarding the nature of a firm, strategic thinking, and knowledge. These axioms are as follows:

1. A firm is a socially constructed, complex, adaptive system;
2. To survive, a firm must be successful in creating value;
3. The goal of strategic thinking is to be prepared for decision making;
4. The probability of success can be increased through better knowledge;
5. Beliefs cannot be accepted as knowledge unless they are logically true and justified.

When combined, these axioms portray a firm as a mental construct of a purposeful system that is in a constant state of flux. Also, it is viewed as a system whose chances of preferred outcomes ultimately depend on the quality of strategists' mental models which, in turn, depend on their ability to generate, justify, and express relevant beliefs regarding particular firms. This view informs us strategists must always combine the aforementioned systems thinking with *critical thinking*, because critical thinking enables the questioning and comparing of mental models to other ways of interpreting reality, and thus also the changing and forming of mental models (De Déa Roglio & Light, 2009).

Specifically, the proposed model is designed on the assumption that future incoming cash flow uncertainty ultimately defines what should be considered 'strategic'. When this notion is embraced, it results in the logical distinction of business world information as:

1. Information relating to cash flows that can be *controlled* by decisions (=known outcomes);
2. Information relating to cash flows that can be *influenced* by decisions (=unknown outcomes).

Both categories are mutually exclusive, but do they capture all relevant business world information? Here, systems thinking tells us that any division of information can only be exhaustive if all relevant *componential* objects of knowledge are incorporated, as well as all *systemic* objects of knowledge. In epistemological terms, these objects of knowledge are 'things', 'relations', and 'events'. Following this argument, the business world can purposefully present itself to the strategist through an information trichotomy (See, Figure 1):

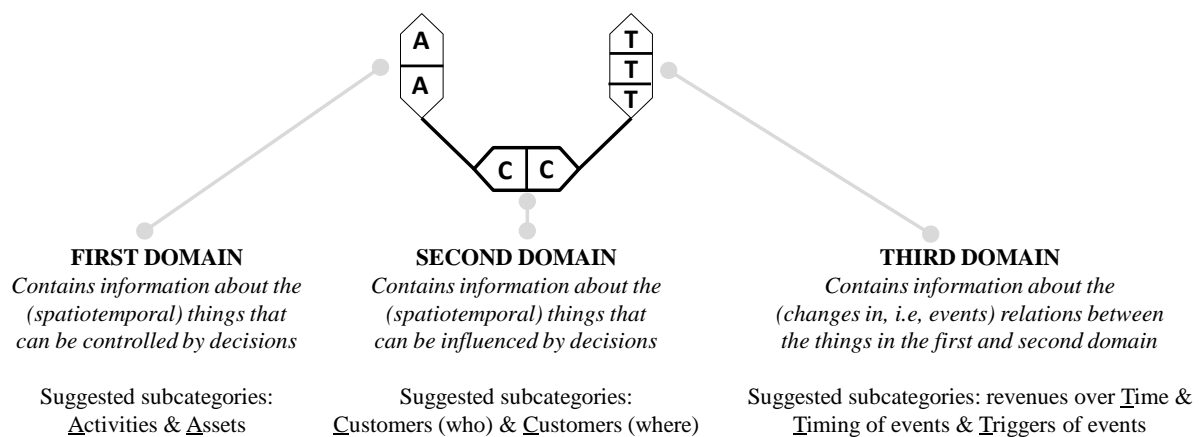

Figure 1. The information trichotomy and suggested subcategories

In its everyday operationalization, the first domain covers information relating to what is usually referred to as 'supply'. The second domain contains information relating to what is commonly referred to as 'markets' or 'demand'. The information in both domains relates to real-life objects which can be sensed externally. The third domain is different because it contains information that is needed to assess the systemic properties of the firm system. This necessitates the inclusion of a 'temporal'

domain to consider relationships between supply and demand over time, as well as any changes in that relationship (i.e., 'events').

Next, as the domains do not refer to observable phenomena or specific data directly, it is necessary to load them with intelligible firm-specific data. Seven real-life subcategories are suggested. For the first two domains they are 'Activities' and 'Assets', and 'Customers (who)' and 'Customers (where)', the latter two reflecting market demand from a behavioral and geographical perspective. It is noted these subcategories provide a useful memory aid for the first two domains, but it is not perfect. For instance, a product's selling price is controlled by a firm, but it is not an asset or activity. Similarly, a firm might want to influence a government even if it is not a customer. For the third domain three subcategories are suggested. They are: 'revenues over Time', 'Timing of events', and 'Triggers of events'. Combined, they facilitate the idea that the relationship between supply and market demand is dynamic, whereas changes can occur in the relation, caused by changes in activities, assets, customer behavior, or geographical markets (the 'things' in the first and second domain). Regarding the 'revenues over Time' subcategory, a strategist must consider all information, apropos an *output* perspective; i.e., information on revenue cash flow outcomes. Focusing on the second 'Timing of events' subcategory entails considering information from an *input* perspective; what events caused revenues to change? These events reveal the dynamically-complex nature of a firm. The third suggested subcategory 'Triggers of events' is concerned with the underlying causes of these events; essentially referring to information regarding external forces, including for instance the ones in the PESTEL acronym. Such forces can trigger a continued effect (e.g., diminishing resources), or a sudden effect on the focal firm (e.g., technological developments).

ANALYSIS AND SYNTHESIS

The order in which the information domains are best dealt with for analytical purposes can be identified through systems logic (see, Figure 2, left icon). When analyzing a situation, any strategist will first try to understand the component parts of the system. This information can only apply to actual 'things', whose information is part of the first or second information domain. Of the two, the Activities & Assets domain should be considered first because, from a cognitive point of view, the second Customer (who/where) domain is one level up on complexity. For instance, information regarding assets should not trigger any discussion; either a firm owns or uses certain assets, or it does not. Information regarding customers is different. It might not be completely abstract, or even specific and recognizable in many cases, but what can be influenced is not a matter of fact (i.e., the customer is not a 'fact'). As a result, statements based on the second domain of information require statistical proof. And, as it is wise to establish facts before discussion commences, analysis of the Activities &

Assets domain logically precedes analysis of the Customers domain. Finally, when we conceive the firm as a system, the third, temporal domain must also be considered. After all, analyzing activities, assets and customers is only useful if it is also clear how they interact; what their (value-creating) systemic properties are.

Figure 2. Use of the information trichotomy for analysis and synthesis

The information trichotomy and its suggested subcategories can also be used for a forward-looking synthesis (see, Figure 2, right icon), given one realizes three things. First, since it is not possible to have information from the future, the information domains can no longer be studied to establish what is or has been; they can be used instead to *imagine* what future things, relations, and events are important. Second, all statements now demand the inclusion of a time dimension because there may only be one past, but there are endless possible futures. Third, the domains need to be approached in reverse: AA–CC–TTT is for analysis, TTT–CC–AA is for synthesis. This reversal supports a purposeful, systematic envisioning of a firm’s future from abstract-to-concrete. In such an exercise, it is sensible to first consider the more abstract, outside forces (i.e., triggers of events) that might lead to imaginable events (i.e., timing of events), which will, in turn, impact the potential for incoming cash flows (i.e., revenues over time). This potential resembles what Gavetti and Levinthal (2000) call the ‘payoff space’, reflecting knowledge of a firm’s potential for value creation. This knowledge must then be used to make congruent assumptions about the industry’s customers and their behavior, marking the inclusion of the second Customers information domain in the synthesis exercise. The final task when making forward-looking statements logically demands consideration of future Activities & Assets, as they are the only things one can actually decide *on*. It marks the point at which the ultimate question for strategists arises: “Given the projected market potential and considering what that says about customer behavior and geographical markets, what should we decide regarding our activities and assets?”. It is where strategic thinking naturally ends.

TOWARDS STRATEGIC WISDOM VIA SEVEN KNOWLEDGE MILESTONES

It can be argued strategists who are able to answer the above question prudently demonstrate strategic wisdom. Epistemologically, it reflects reaching a knowledge milestone. It is posited this milestone is: *Having knowledge of how the firm is expected to ‘work’ & Having knowledge of what this likely*

means for what can be controlled and influenced by the firm. Figure 3 illustrates this is identified as the final milestone in a series of seven knowledge milestones that can be discerned between the two extremes of 'firm-specific ignorance' and 'firm-specific strategic wisdom'. Metaphorically, reaching a knowledge milestone means the strategist is able to write a purposeful chapter in the 'story of a firm' that is relevant for strategy-making. Consistent with the theory of foundationalism, and visualized in Figure 3, such storytelling prescribes that justified beliefs are structured like a building, with a foundation and a superstructure (see, e.g., Hasan & Fumerton, 2018). Beliefs belonging to the superstructure (i.e., later chapters) are supported by the justified beliefs in the foundation (i.e., earlier chapters). By means of the icons, Figure 3 also shows the information trichotomy applies to each chapter; it is only the content-perspective of the statements that differs. Each knowledge milestone reflects one for strategy-making purposes relevant content-perspective. Table 1 illustrates this. It presents an example propositional statement for each of the seven content-perspectives, regarding the same object of knowledge (in this case the 'Customers (who)' object of knowledge).

Strategy-Making Phase	Content Perspective of Statement	Example Statement	Section in Table A1
'obtain general knowledge'	Non-industry- / non-firm-specific	"The customer is the entity that decides to buy from a firm."	#3
Empirical	Absolute, industry-specific	"This industry operates in a B2B market."	#10
Empirical	Absolute, firm-specific	"The firm sells to supermarkets."	#17
Sensemaking	Relative, industry-specific	"Customers in this industry are loyal."	#24
Sensemaking	Relative, firm-specific	"The firm has a large customer base."	#31
Envisioning	Absolute, industry-specific	"The key customer demographic in this industry is expected to double in size over the next five years."	#40
Envisioning	Relative, firm-specific	"The firm is better equipped than its competitors to meet the growing demand for more luxury."	#47

Table 1 Example statement for seven identifiable statement perspectives regarding the 'Customers (who)' subcategory of the information trichotomy

USING THE 72 MODEL AS AN EPISTEMIC TOOL

How the different perspectives align with the seven chapters, and how the chapters align with the seven knowledge milestones is illustrated in the Appendix (Table A1). This table shows that, to reach the knowledge milestones, statements need to be made regarding the seven suggested subcategories, for each of the seven content perspectives. Each perspective corresponds with a 'chapter' in the for strategy-making purposes relevant story of a firm. As Table A1 shows, this story has 49 sections. Organized and presented in this way, they provide an epistemic tool for analysis and

synthesis during strategy-making. Next, it is briefly discussed how this '7² Model' can be systematically applied in practice by addressing the subsequent sections.

Clearly, the first concern in any strategic thinking exercise is *having an adequate general knowledge base* (i.e., milestone 1, see, bottom Figure 3 and bottom left Table A1). After all, the more general knowledge strategists have of what the firm *can* do (section #1), of what they *can* own (section #2), of which customers and what geographical markets (sections #3 and #4) *can* be distinguished, of what *can* happen, and of what causes *can* exist (sections #5, #6, #7), the better equipped they are to undertake relevant analyses or syntheses.

Subsequently, a strategist must identify what controllable phenomena (e.g., activities and assets) define a particular industry. To this end, the aforementioned knowledge of what firms can do and own must be compared to what firms in an industry *actually* do (section #8) and own (section #9). This is important because strategists should not try to develop mental models of the *entire* business environment of a firm. Moreover, the potential importance of firm activities and assets like R&D, engineering, product development, outlets, intellectual property, brand image, permits, staffing quality, and the like, only becomes clear if one realizes that these elements are not necessarily relevant in other industries. Next, one must understand what characterizes the market, and how both a firm's industry *and* the firm itself developed to the present day. To this end, sections #10 through #21 (making up the remainder of the second and third chapter) must be addressed. If done properly, two empirically-based knowledge milestones are reached (see, Figure 3 for the corresponding second and third knowledge milestones).

When formulating chapters four and five, the focus shifts to how the firm's industry differs from other industries, how the firm differs from its competitors, and what these differences could mean for value creation; this constitutes the 7² Model's sensemaking phase. Unlike the statements made in the empirical phase (see, Table 1), this phase is concerned with making *relative* statements. Comparative statements are necessary because, on the one hand, value creation itself is a relative phenomenon, and, on the other, strategic thinking is needed due to competition, making industry and firm comparisons essential. It means absolute statements regarding things like activities and assets have no intrinsic value. This phase aims to overcome this by making sense of (ascribing for value creation functional meaning to) the knowledge produced in the empirical phase. Ideally, this phase ends with the articulating of a practical, value-creating theory for a firm's industry and the firm, based on all knowledge produced.

Finally, chapters six and seven must be formulated to envision how both a firm's industry and the firm are expected to develop in the future. These two chapters make up the 7² Model's envisioning phase. In it, the aforementioned value-creating theories can be applied to justify statements about

future events (sections #36, #37, #43, #44), and *future* relations (sections #38 and #45) in the firm's business environment, followed by statements about the things firms can influence by decisions (sections #39, #40, #46, #47). As a final step, strategists should reflect on how the industry can benefit most from expected customer behavior (sections #41 and #42), and, most importantly, how the firm can change its activities and assets accordingly (sections #48 and #49). This must be considered last, so as the strategist is prepared for deciding what activities and assets it must keep from the past, lose from that past, and create in the present, to go to the preferred future state (Handy, 1995; Liedtka, 1998). In short, chapter seven marks the reaching of the final knowledge milestone; the one that enables the demonstrating of strategic wisdom.

DISCUSSION AND CONCLUSIONS

Practicing strategists need skills for generating knowledge so as to manage, understand, and reduce the uncertainty that typifies the future of a firm. According to Spanos and Lioukas (2001) and Dougherty (1993), strategic decision making requires at least a combination of relevant knowledge creation and an integrating process. Barney (2001, p. 49) argues that a complete "model of strategic advantage would require a full integration of models of the competitive environment with models of firm resources". According to (Farjoun, 2008) such forward-looking mental or process models are indispensable for strategizing because they attempt to define the nature, level, and scope of the uncertainty the firm faces (Dickson, Farris, & Verbeke, 2001). By providing a well-grounded epistemic tool, the 7² Model specifically guides strategists towards a coherent, functional, justifiable, forward-looking perspective on a firm. Future research on the 7² Model is recommended in terms of investigating, among other things, how the explicating of an underlying question per section may offer strategists detailed guidance in obtaining, integrating and applying case-specific knowledge in strategy-making practice. The resulting narrative infrastructure may also inspire new research, especially as it can illustrate how important but disparate tools and concepts can be related linguistically (when their implied questions are explicated as well). As an example, Table 1 highlights how the 7² Model conceptually links the value chain model, PESTEL, business model canvas, Porter's five forces, RBV, and the dynamic capabilities view (see, respectively, sections #1, #7, #15-19, #27+36, #30, #24+34). Experts could also retrospectively rate the quality of strategic decisions made with and without the 7² Model by otherwise equal strategists.

A TYPOLOGY FOR CHEESE BUSINESSES BASED ON THEIR STRATEGIC ORIENTATION

Varvaras, I.¹; Aggelopoulos, S.²; Pavloudi A.²

¹School of Business, University of Nicosia, Cyprus

²School of Agriculture, International Hellenic University, Greece

ABSTRACT

In Greece, the food sector and specifically that of cheese business consists the backbone of economy and requires special investigation. The identification of the current situation and the particularities characterizing the specific sector is very important in a period of economic crisis. This effort will be made through creating the typology for cheese businesses and identifying their strategic orientation. At the same time, the basic financial indexes and the innovativity of the businesses will be examined.

Keywords: typology for cheeses businesses, strategic orientation, Greek cheese businesses, financial indexes, innovativity.

1. INTRODUCTION

The cheesemaking sector was chosen due to its important role in the Greek economy and also its strong growth prospects. According to official data of the Hellenic Statistical Authority (2016), the processing sector occupies the first place with a share of 98.8% of the total value of products sold. The food industry is in the lead of the processing sector with a rate of 19.6% of the total value of products sold, while dairy and cheese manufacturers make a significant contribution to forming the value of products sold and rank first in the industry sector (in the years 2013 and 2014 the corresponding rates were 21.2% and 21.5%, respectively). In Greece, the cheese industry involves a large number of businesses, (545 cheese dairies according to Eurostat, 2012), thereby supporting the development of other production sectors (milk production) but also multiple other enterprises (engineering equipment, maintenance, etc.). Regarding the domestic cheese production, it presents a rising trend over time and the exports of cheese products are increasing in the last years, according to the Hellenic Statistical Authority. Indicatively, in 2016 the total exported quantities reached 58,557 tons, which was the highest rate in the last seven years and increased by 9.5% in relation to 2013.

2. MATERIALS AND METHODS

The aim of the present paper is to investigate the effect of development strategies, economic performance and innovativity on finding and improving the competitiveness of food businesses and particularly cheese businesses. It is worthwhile to note that there are not many studies focusing on analyzing the sector, the followed strategies, the innovation levels of these businesses and their development prospects. In addition, a sub-target is to categorize the cheesemaking businesses based on their common characteristics and through these characteristics to extract a typology.

The number of the cheese businesses which participated in the study was based on the data obtained by the Greek Ministry of Rural Development and Food as well as the Greek agricultural organization "Dimitra" of the year 2016 and concerned the data for the year 2015. In addition, the study was implemented in the last quarter of 2016.

The present study focused on businesses whose productivity is equal to or greater than 200 tons and which have a share at about 90% of the total quantity produced (126 cheese businesses). That is because industry studies are conducted in a similar manner. According to the relevant literature, the remaining businesses due to their special characteristics (small family-owned or small and medium-sized enterprises) are often studied separately from the others as particular categories (ICAP, 2012; ICAP, 2016). In our study, we tried to contact all cheese businesses (126 in total), however this was not feasible due to certain difficulties. Of these, only 68 responded.

The questionnaire used in the survey consisted of two parts: the first part concerned the identification of the innovativity level and was developed based on international manuals recording innovation (Oslo manual 2005, Frascati manual) and on the relevant questionnaires of the European statistical service (Community Innovation Survey, 2010). The second part of the questionnaire included questions aiming at indicating the strategic orientation of the studied businesses. To design the questionnaire, the methodology developed by Dess and Davis (1984) was used. Moreover, to identify the strategic orientation of the businesses, Porter's classification framework was used (Theodossiou *et al.*, 2014; Sergaki *et al.*, 2014; Salvou & Sergaki, 2013; Bourlakis, 2011; Salvou, 2010; Salvou & Halikias 2009).

In terms of statistical analysis, Principal Component Analysis was used to indicate the strategic orientation of the businesses. In specific, through the application of the analysis on main components (Principal Component Analysis) the structural cohesion of variables composing the strategic orientation of each business was examined (Hair *et al.*, 1995; Sharma, 1996; Cattell, 1978; Dunteman, 1989; Tabakis, 2001). For each business, through PCA one score of strategic orientation was estimated with the use of the regression method (Hair *et al.*, 1995).

The same method was used to process the data and to extract the financial indicators (Niarchos, 2004; Atrill *et al.*, 2006; Vasiliou & Iriotis, 2008) so that the financial profile of the business could be developed (Niarchos, 2004; Brealey *et al.*, 2006; Gitman, 2005; Van Horne, 2002) through their typological analysis (Menexes & Aggelopoulos, 2008).

In the study, four basic categories of financial indexes were examined through an equal number of indexes:

1. Circulation or Overall Liquidity Index (Liquidity Indexes).
2. Circulation Velocity Assets Index (Activity Indexes).
3. Overall Leverage Index (Leverage Indexes).
4. Gross Profit Index (Performance Indexes).

In addition to the above indexes we created an Innovativity Index which shows how innovative are the businesses in relation to the other businesses which participated in the study. This index was developed by aggregating the positive responses to questions examining the innovation of the businesses.

Moreover, to get a better picture of the businesses' expenditure on innovative activities, we used Principal Component Analysis for Categorical Data and hence an overall index for the expenditure was created. The data required for the index were found by measuring expenditure after dividing it into current expenditure, which concerned running costs and labor costs, and capital expenditure, which referred to fixed capital assets without depreciation. Furthermore, Hierarchical Cluster Analysis was used to create clusters of businesses with similar behavior regarding the applied development and innovation strategies as well as economic performance (Chalkias, 2010; Siardos, 1999; Hair *et al.*, 1995; Coakes & Steed, 1999; Kobrich *et al.*, 2003; Iliadis *et al.*, 2004; Barnes *et al.*, 2007; Wilhelmsson, 2004; Everitt, 1993; Hair *et al.*, 1995; Sharma, 1996).

Afterwards, cheese businesses were classified based on their characteristics. This step is quite important since it can be the "guide" for assessing the current situation and help acquire competitive advantage against similar businesses (Kobrich *et al.*, 2003). As already mentioned, the development of typologies was carried out through Cluster Analysis (Hair *et al.*, 1995; Coakes and Steed, 1999; Menexes & Aggelopoulos, 2008).

The process described above helped form 'groups' or 'types' or 'business clusters', which regardless of being differentiated from each other, maintained the same homogeneity criteria for specific common or alike characteristics (in this paper we will refer to them as 'clusters'). Moreover, hierarchical cluster analysis was used to form the typology of the study sample's cheese businesses (Everitt, 1993; Norusis, 1992; Aldenderfer & Blashfield 1984), as a reliable tool to rationally assess them. Next, the clusters were created according to the Ward criterion and to measure the difference among the

studied businesses the squared Euclidean distance was used (Hair *et al.*, 1995; Sharma, 1996). The relevant significance (contribution) of the variables forming the clusters was evaluated through the coefficient of determination R² (Sharma, 1995).

The necessary statistical analyses were performed with the statistical package SPSS 15.0 (Kinnear & Gray, 1995; Babbie and Halley, 1998; Bryman and Cramer, 1999; Coakes and Steed, 1999) with the installation of the subsystem Exact Tests (Mehta and Patel, 1996). At the same time, the significance level of statistical tests was defined at $\alpha=0,05$. Meanwhile, to gain further insights into the specific characteristics of the clusters of the cheese businesses, the profile of the clusters was examined in relation to other variables which did not participate in the formation of the clusters but were explored through the questionnaire.

The analysis resulted in the creation of profiles of two levels. The first profile was based on the strategic orientation and the second on the number of employees, the mean production measured in tons, the financial indexes, the innovativity indexes and innovation expenditure. Finally, based on the production degrees (scores) a cheese businesses typology was developed to monitor if they can be grouped in clusters to highlight the specific characteristics of each cluster.

3. RESULTS

Hierarchical Cluster Analysis was conducted, to form the typology of the sample's cheese businesses on the basis of the three factorial axes of the strategic orientation. Simultaneously, the squared Euclidean distance was applied to measure how the businesses differentiated from each other, while the Ward criterion was used to form the clusters. Notably, the businesses typology was based upon their strategic orientation. Hierarchical Cluster Analysis was applied on the standardized scores (z-scores) of businesses on each axis of the strategic orientation. Our analysis indicated the formation of four distinct clusters of cheese businesses (see Diagram A1 and Diagram A2).

First-level profile of clusters-groups

As it can be seen in Diagram 1 and Diagram 2, the cheese businesses which were included in our sample can be grouped into four clusters. Hence, 28 cheese businesses belong to Cluster 1 (C1) making up 41.2% of the sample, 10 businesses belong to Cluster 2 (C2) representing 14.7% of the sample, 14 businesses belong to Cluster 3 (C3) making up 20.6% of the sample and finally 16 businesses belong to Cluster 4 (C4) representing 23.5% of the sample.

CLS: Cost Leadership Strategy, DS: Diversification Strategy, FS: Focus Strategy

Diagram 1: First-level profile of the four clusters

CLS: Cost Leadership Strategy, DS: Diversification Strategy, FS: Focus Strategy

Diagram 2: Second-level profile of the four clusters

According to Table 1 and the rates of the determination coefficients R2, it is indicated that all three coefficients play an important role in the formation of the four clusters. Specifically, the coefficients **DF** (Diversification Strategy) and **FS** (Focus Strategy) make the greatest contribution followed by the coefficient **CLS** (Cost Leadership Strategy).

Types-Clusters	CLS*	DS*	FS*	N (%)
C1	53.2 b	63.2 b	75.8 b	28 (41.2%)
C2	39.8 d	51.8 d	56.6 d	10 (14.7%)
C3	62.3 a	69.6 a	86.5 a	14 (20.6%)
C4	49.0 c	59.0 c	62.3 c	16 (23.5%)
Total	52.1	61.9	72.0	68
ANOVA P	<0.001	<0.001	<0.001	
R2	0.753	0.818	0.806	

*For each dimension of the Strategic Orientation, average rates which are followed by a Latin letter present a statistically significant difference at significance level $\alpha=0.05$ ($P\leq 0.05$), according to the Tukey test. CLS: Cost Leadership Strategy, DS: Diversification Strategy, FS: Focus Strategy

Table 1: Centroids (average rates) of cheese businesses' Clusters-Types

Cluster 1 which makes up the biggest share (41.2%) of the sample's cheese businesses presents the following profile in terms of the three determining factors.

Regarding the coefficient Focus Strategy (FS), the cheese businesses belonging to this cluster are characterized by the Strategic Orientation of the Focus Strategy with the highest average 75.8%. Moreover, it can be observed that it is distinguished from the other types of Strategic Orientation.

As for the Diversification Strategy (DS), the cheese businesses are characterized by 63.2% by the Strategic Orientation of the Differentiation Strategy. Hence, the percentage of businesses trying to cope with the competition by creating unique products is not high.

In relation to Cost Leadership Strategy (CLS), the Strategic Orientation of the Cost Leadership Strategy characterizes the cheese businesses by 53.2%. This means that the businesses of Cluster 1 do not choose low-cost production. This inference can be further supported by the major divergence in relation to coefficient FS which according to Table B1 is greater than 20 percentage points but lower than the coefficient DS.

In view of the above results, it is indicated that the businesses of this cluster choose a particular market segment, aim at it and try to gain a competitive advantage against the other businesses, while meeting the special needs of this segment. This can be achieved either by diversifying the produced product against competition or by focusing on the cost of the produced product.

The second cluster (C2) consisting of 10 businesses (14.7%), is the smallest of all clusters and presents the following profile in terms of the three coefficients.

Regarding coefficient Cost Leadership Strategy (CLS), the businesses of Cluster 2 are characterized only slightly (by 39.8%) by the Strategic Orientation of the Cost Leadership Strategy. Namely, the businesses of this cluster do not choose low-cost production to diversify themselves from other similar businesses.

As for the factor Diversification Strategy (DS), the businesses of the second cluster choose the Diversification Strategy at a low rate, by 51.8%. It should be noted that this percentage is considered low despite being greater than the coefficient of Cost Leadership Strategy.

Finally, although the Focus Strategy prevails over the two previous coefficients, its percentage remains low since only 56.6% of businesses choose the Focus Strategy for their Strategic Orientation. Consequently, it can be stated that the second cluster is comprised of few businesses which tend to choose slightly the Focus Strategy even though they are not in a position to have a clear strategic orientation.

The third cluster (C3) consists of 14 businesses (20.6%) and presents the following profile in terms of coefficients.

In relation to Cost Leadership Strategy, the Strategic Orientation of the Cost Leadership Strategy characterizes by 62.3% the cheese businesses of this cluster. That is, the businesses of the third cluster can produce products at low cost as a reliable means of gaining a competitive advantage.

Regarding the Diversification Strategy, the cheese businesses are characterized by the Strategic Orientation of the Diversification Strategy by 69.6%. Thus, this percentage is greater than the coefficient CLS but still very close to this option.

As for the Focus Strategy, the cheese businesses of this cluster are characterized by the Strategic Orientation of the Focus Strategy by the highest average which is 86.5%. In addition, it can be observed that it is distinguished from the other types of Strategic Orientation.

Hence, the third cluster gives priority to the Focus Strategy rather than the other two strategies. That is, to gain a competitive advantage the businesses of this cluster focus on a specific segment of the market and meet their needs by diversifying the produced product or by focusing on the cost of the produced product.

Cluster 4 (C4) is comprised of 16 businesses (23.5%) and presents the following profile in terms of the three coefficients.

In relation to Cost Leadership Strategy (CLS), for their Strategic Orientation the cheese businesses of the fourth cluster seem to choose the Cost Leadership Strategy by 49%.

Concerning the Diversification Strategy (DS), the businesses of the fourth cluster appear to choose this strategy by 59.0% and this percentage is higher than the one of CLS but sufficiently low to diversify from it.

With regard to the Focus Strategy (FS), the businesses of the fourth cluster are characterized by the Strategic Orientation of the Focus Strategy by 62.3%. Hence, this cluster prioritizes the Focus Strategy to a higher degree than the other two strategies, while their percentage difference is very low.

The above observations can lead to the conclusion that the cheese businesses of the fourth cluster are not in a position to follow thoroughly a specific strategy. According to Porter's theory, such businesses are characterized as "stuck in the middle" and this observation takes on particular importance since the fourth cluster has the second highest number of businesses of all clusters.

The following table (Table 2) presents the identification of the four clusters containing the cheese businesses in terms of the first-level profile.

Clusters	Characteristics
C1 "Orientation in Focus Strategy with Diversification"	<ul style="list-style-type: none"> - Selection of a specific market segment - Meeting special needs of the target market - Attempt to diversify the produced products
C2 "Potential Orientation in Focus Strategy"	<ul style="list-style-type: none"> - Difficulty in selecting a segment of the target market - Difficulty in selecting a specific way to diversify products against competition - Attempt to follow the Focus Strategy - Difficulty in meeting the needs of the target market
C3 "Orientation in Focus Strategy with Diversification or Cost advantage"	<ul style="list-style-type: none"> - Selection of a particular market segment - Meeting the specific needs of the target market - Diversification in produced products - Cost advantage for produced products

C4 Orientation difficulty "Stuck in the middle"	<ul style="list-style-type: none"> - Difficulty in selecting strategic orientation - Difficulty in creating competitive advantage - Difficulty in increasing profits - Difficulty in diversifying produced products - Difficulty in gaining loyal customers
--	--

Table 2: Identification of clusters in terms of first level profile

Second level cluster profile

To gain further insights into the specific characteristics of the indicated clusters, the profile of businesses was investigated in relation to other variables which did not participate in the formation of the clusters but were examined through a questionnaire. These variables involved the number of employees, the production in tons, the financial indexes, the innovativity indexes and the innovativity expenditure indexes.

Types-clusters	Personnel	Production (tons)
C1	13.6 b	1072.5 b
C2	6.5 c	427.0 c
C3	44.9 a	3993.6 a
C4	13.8 b	1029.1 b
ANOVA P	<0.001	<0.001
Total	19.0	1568.8

In each column, the average rates followed by a different Latin letter present significant statistical difference at significance level $\alpha=0.05$ ($P\leq 0.05$), according to the Tukey test.

Table 3: Comparison between clusters-cheese business types in terms of their average number of employees and the average production in tons

As Table 3 shows, the third cluster (C3) presents the highest average number of employees (44.9 employees) and the highest average production (3,993.6 tons) compared to the other clusters of the analysis.

Cluster 3 is followed by the fourth cluster (C4), where the average employee number is 13.8 and the average production is equal to 1029,1 tons and the first cluster (C1) where the average employee number is 13.6 and the average production 1027,5 tons. Finally, cluster 2 (C2) presents the lowest average number of employees (6.5) and the smallest average production (427 tons).

Types-Clusters	COLI*	CVAI*	OLI*	GPI*
C1	3.21	1.23	0.45	0.14
C2	4.27	1.03	0.42	0.17
C3	2.72	1.08	0.51	0.15
C4	2.11	1.57	0.57	0.16
ANOVA P	<0.112	<0.239	<0.408	<0.767
Total	3.01	1.25	0.49	0.15

In each column, the average rates followed by a different Latin letter present a statistically significant difference with significance level $\alpha=0,05$ ($P\leq 0.05$), according to Tukey test. *COLI (Circulation or

Overall Liquidity Index), CVAI (Circulation Velocity Assets Index), OLI (Overall Leverage Index) and GPI (Gross Profit Index).

Table 4: Comparison between Clusters-Types of cheese businesses in terms of their financial indexes

With regard to Table 4, certain observations can be made. Regarding the variable COLI, the second cluster (C2) presents the highest average, which is 4.7, followed by C1 with average 3.21, C3 with average 2.75 and finally C4 with average 2.11. These results allow us to state that clusters C2 and C1 have adequate liquidity and can fulfill their obligations, while C3 can fulfill its obligations and lastly C4 can marginally meet its obligations.

In terms of the variable CVAI (Circulation Velocity Assets Index), cluster C4 has the highest average of 1.57, followed by C1 with an average of 1.23, C3 with an average of 1.08 and C2 with an average of 1.03. In the light of these results, it may be stated that all clusters utilize their assets to enhance their sales. In specific, clusters C4 and C1 do so to a higher degree than clusters C3 and C2 which follow this strategy only a little above the limit.

In terms of the OLI (Overall Leverage Index), cluster C2 presents the lowest average which is equal to 0.42, whereas C1 has an average of 0.45, C3 an average of 0.51 and C4 an average of 0.57. These results allow us to infer that the second cluster (C2) uses more own capital for the production process rendering the businesses of this cluster more attractive to financial institutions compared to those of the other clusters. Moreover, it can be observed that cluster C1 has also a low average (in comparison to clusters C3 and C4), while it is closer to cluster C2 (characterized by using own capital and low level of external finance). In addition, cluster C1 is followed by cluster C3 which presents an average that shows a balance of foreign capital of total asset. The latter means that foreign capital is used in such a way that obligations can be met. Finally, cluster C4 has the highest average indicating that it uses external financing more than the other clusters, but a possible attempt to acquire some new financing may not be feasible.

On a general note, it may be stated that the overall average of all clusters is relatively low (0.49) which highlights their effort to decrease external financing which however in turn reduces their profits.

In relation to GPI (Gross Profit Index), cluster C2 has the highest average of 0.17 followed by cluster C4 (average 0.16), cluster C3 (average 0.15) and cluster C1 (average 0.14). In view of these results we can reach the conclusion that the second cluster (C2) has the greatest margins for gross profits compared to the other clusters, although it generally has small gross profit margins. Moreover, it is interesting that the overall average of all clusters is quite low (0.15) highlighting the difficulty in increasing profits.

Types-Clusters	Innovativity Index	Innovativity Expenditure Index
C1	6.89 a	33.94 ab
C2	4.40 b	12.58 b
C3	8.57 a	53.76 a
C4	4.44 b	18.01 b
ANOVA P	<0.001	<0.001
Total	6.29	31.13

In each column, the average rates followed by a Latin letter differ significantly statistically at significance level $\alpha=0.05$ ($P\leq 0.05$), according to Tukey's test.

Table 5: Comparison between Clusters-Types of cheese businesses in terms of their Innovativity Indexes and Innovativity Expenditure Indexes

As shown in Table 5, in relation to the variables "Innovativity Index" and "Innovativity Expenditure Index", cluster C3 presents the highest averages (8.57 and 53.76, respectively) followed by cluster C1 (6.89 and 33.94, respectively), cluster C4 (4.44 and 18.01, respectively) and cluster C2 (4.40 and 12.58, respectively). In view of these results, it can be seen that cluster C3 has the highest degree of innovativity of all clusters. Yet, the relevant expenditure for such innovativity is quite high. Next, in Table 6 the characteristics of the four clusters based on the second level profile are presented.

Clusters	Characteristics
C1	<ul style="list-style-type: none"> - Medium number of employees - Medium production - Quite good liquidity and ability to meet obligations - Intensive use of assets - Use of own capital for the production process - Small margins for gross profit - High innovativity level and quite high innovativity expenditure
C2	<ul style="list-style-type: none"> - Small number of employees - Low production - Good liquidity and ability to meet obligations - Marginal and intensive use of assets - Greater use of own capital and low external financing - Small margins for gross profit - Low innovativity level and low innovativity expenditure
C3	<ul style="list-style-type: none"> - High number of employees - Big production - Medium liquidity and ability to fulfill obligations - Marginal and intensive use of assets - Use of foreign capital to meet obligations - Small margins for gross profit - High innovativity and high innovativity expenditure
C4	<ul style="list-style-type: none"> - Medium number of employees - Medium production - Medium liquidity and ability to marginally fulfill obligations - More intensive use of assets - Use of external financing

	<ul style="list-style-type: none"> - Small margins for gross profit - Low innovativity level and low innovativity expenditure
--	---

Table 6: Cluster identification in terms of the second level profile

With regard to the second level profile, it can be stated that cluster C1 involves medium number of employees and has medium production capacity. The businesses belonging to this cluster can fulfill their obligations since they have an adequate liquidity. At the same time, assets are intensively used, and the production process is realized through own capital. Regarding innovativity, they present a high levels of innovativity and innovativity expenditure. Nevertheless, the margins for gross profit remain small.

Regarding cluster C2, both the number of employees and production capacity are low, while it has good liquidity and businesses can fulfill their obligations. Simultaneously, they use their assets intensively and marginally. In addition, the production process is based on own capital and small external financing. In relation to innovativity, they present low levels of innovativity and innovativity expenditure. Finally, the margin for gross profit is small.

Cluster 3 (C3) employs a large number of employees and has a high production capacity. Moreover, it has medium liquidity and the businesses of this cluster can meet their obligations. Meanwhile, they make intensive and marginal use of assets, whereas the production process is achieved mainly through the use of external financing. Foreign capital is used in such a way that the businesses can meet their obligations. At the same time, they present high levels of innovativity and innovativity expenditure. Despite these efforts, the margin for gross profit remains low.

Cluster 4 (C4) employs a medium number of employees and has a medium production capacity. The liquidity is medium, and businesses can only marginally fulfill their obligations. Simultaneously, assets are intensively used, and the production process is achieved through external financing. In addition, the levels of innovativity and innovativity expenditure are low. As with the previous clusters, the gross profit margin is small.

4. CONCLUSIONS

Observing the results related to the four clusters of the cheese businesses, as these were formed in terms of the first (Table B2) and second level (Table 7) profiles, certain conclusions may be drawn. First, the cheese businesses of the third cluster (C3) follow the Focus Strategy for their Strategic Orientation compared to clusters C1 and C2 which do not correspond to all characteristics of this strategy although they prioritize this strategy. Finally, it is worthwhile to note that Cluster 4, the most populous cluster, cannot or is not in a position to follow or even to tend towards a specific strategic

orientation. Consequently, the businesses of this cluster remain uncompetitive and have low profit margins.

Cluster C1	Cluster C2	Cluster C3	Cluster C4
Orientation in Focus Strategy with Diversification	Potential Orientation in Focus Strategy	Orientation in Focus Strategy with Diversification or Cost advantage	Orientation difficulty "Stuck in the middle"
First level profile	First level profile	First level profile	First level profile
<ul style="list-style-type: none"> - Selection of a particular market segment - Meeting special needs of the target market - Attempt to diversify the produced products 	<ul style="list-style-type: none"> - Difficulty in selecting a part of the target market - Difficulty in diversifying the produced products against competition - Attempt to follow the Focus Strategy - Difficulty in meeting the needs of the target market 	<ul style="list-style-type: none"> - Selection of a particular market segment - Meeting the specific needs of the target market - Diversification in produced products - Cost advantage for produced products 	<ul style="list-style-type: none"> - Difficulty in selecting strategic orientation - Difficulty in creating competitive advantage - Difficulty in increasing profits - Difficulty in diversifying produced products
Second level profile	Second level profile	Second level profile	Second level profile
<ul style="list-style-type: none"> - Medium number of employees - Medium production - Quite good liquidity and ability to meet obligations - Intensive use of assets - Use of own capitals for the production process - Small margin for gross profit - High innovativity level and quite high innovativity expenditure 	<ul style="list-style-type: none"> - Small number of employees - Low production - Good liquidity and ability to meet obligations - Marginal and intensive use of assets - Greater use of own capital and low external financing - Small margins for gross profit - Low levels of innovativity and innovativity expenditure 	<ul style="list-style-type: none"> - High number of employees - Big production - Medium liquidity and ability to fulfill obligations - Marginal and intensive use of assets - Use of foreign capital to meet obligations - Small margins for gross profit - High levels of innovativity and innovativity expenditure 	<ul style="list-style-type: none"> - Medium number of employees - Medium production - Medium liquidity and ability to marginally fulfill obligations - More intensive use of assets - Use of external financing - Small margins for gross profit - Low levels of innovativity and innovativity expenditure

Table 7: Summary table of clusters in terms of the first and second profile

To conclude, the grouping of cheese businesses based on their common characteristics enables us to draw inferences related to their operation and how they interact with the external environment. According to the results of the present study, most businesses follow or try to follow the focus strategy for their strategic orientation. At the same time, it was indicated that 38.2% of the sample tries

to follow this strategy or cannot follow any strategy which results in negative consequences such as being “stuck in the middle”.

Regardless of the cluster they belong to, their strategic orientation and innovativity, businesses still have small margins for gross profit and possibly a future study could shed more light on the reasons accounting for this difficulty. Lastly, the present study could serve as a basis for further and more thorough research on the cheesemaking sector but not on the food sector.

THE RELATIONSHIP AMONG STRATEGIC ORIENTATION, INNOVATIVITY DEGREE AND FINANCIAL EFFICIENCY IN THE FOOD INDUSTRY

Varvaras, Ioannis¹; Aggelopoulos, Stamatis²; Pavloudi, Alexandra²

¹University of Nicosia, Nicosia, Cyprus

²School of Agriculture, International Hellenic University, Thessaloniki, Greece

ABSTRACT

In the context of increasing competitiveness among food businesses, it is interesting to understand the factors which reinforce the competitive advantage as well as the way the factors interact with each other. The proposed theoretical framework examines the link among three basic factors (Strategic Orientation, Innovativity Degree and Financial Results) and how they affect each other. Hence, the aim of the present paper is to evaluate the relationship among the above factors and examine the validity of their proposed correlation model. To test the theoretical model, the Structural Equation Model was applied to big Greek cheese businesses. The results of the empirical analysis led us to the conclusion that in the food sector and specifically in that of cheese businesses there is interdependence among Strategic Orientation, Innovativity Degree and Financial Results.

Keywords: Strategic Orientation, Innovativity Degree, Financial Results, Competitiveness, Cheese Businesses.

INTRODUCTION

Finding and analyzing competitiveness can provide answers to classic economic questions, such as what defines investments in businesses, the success of businesses, the development of businesses or what government policy should be followed to develop businesses (Abbott & Brehdahl, 1993; Porter, 1990). Unfortunately, there is no specific definition of competitiveness while its finding and quantification consists a rather difficult process since competitiveness can refer to and be analyzed in various levels. Specifically, competitiveness can refer to the level of an entire economy (i.e. of state), the level of a particular sector or the level of an individual business (Bojnec & Fertó, 2014; Frohberg & Hartmann, 1997). At the same time, measuring and quantifying competitiveness is often closely related to the factors which emerge both in the internal and external environment of the business but also of the economy in which they are active, while the involvement of the personal view of the investigator makes the whole process composite and complex (Latruffe, 2010; Traill & Pitts, 1998). In

this paper, we deal with the relationship among three basic factors of competitiveness. That is, Strategic Orientation, Innovation Degree and Economic Performance are studied at the level of a particular business sector, the sector of Greek cheese businesses. In total, 68 cheese businesses from all parts of Greece with production higher than 200 tons participated in the survey. Moreover, to reach conclusions, the Structural Functional Model was used.

2. CONCEPTUAL FRAMEWORK

Competitiveness is a multidimensional notion which assumes great importance when applied at a business level (OECD, 2011). According to Latruffe (2010), competitiveness can be defined as the ability to address competition successfully or the ability to sell products which satisfy the requirements of demand (price, quality, quantity), while profits allowing the business to flourish gradually are made.

A business or an organization aims at creating competitive advantage so that it can distinguish through its singularity over its competitors. To understand how the competitive advantage occurs, we must first try to understand it. On a general note, it can be said that the competitive advantage means that a business does something better than competition (Kaliski, 2001). As Grant (2008) notes, it is difficult to define the competitive advantage. At a basic level, "a business has a competitive advantage over the other businesses when it makes greater profits" or "when it can produce better financial results than the others" (Barney & Hesterly, 2008). Thus, the competitive advantage is associated with the creation of value (Van Horne & Wachowicz, 2008; Broyles, 2007), but also with maintaining an above-average profitability for many years. Consequently, it can be stated that under these circumstances the business has a stable competitive advantage (Hill et al., 2014). In addition, Pietersen (2010) defines competitive advantage as achieving a bigger gap between the perceived by customers product value and the costs that the business covers to provide the competitive advantage in comparison to competitors.

In view of the above, a crucial question arises: how can the notion of competitive advantage exist if it is defined only by business profitability? Rumelt (2003) and Grant (2008) claim that the competitive advantage can be related to other factors as well. Indicatively, a business can choose to stop making profit for the sake of investments in a technology market or in view of the customers' needs.

According to Porter (1985), the competitive advantage is a set of activities undertaken by a business and involves new or improved products, services, organization systems, marketing systems, production systems, predictions of market developments and generally every form of innovation. From this perspective, it is observed that innovation is one of the most significant factors determining

the rules of the current business competition (Jongen & Meulenbergh, 2005). The same observations were reinforced by Dess and Davis (1984). At the same time, Kim and Mauborgne (2005) also regarded innovation as advantageous and concluded that successful businesses create competitive advantage while redefining their product supply through innovation (increase in product value). That is, they create a new space in the market (in this case the market in which a business is active consists another factor). This claim is further supported by the perception that a business or an organization maintains the competitive advantage and the enhanced financial performance through innovation (Dess et al., 2014).

Beside the above, the competitive advantage is also related to the strategies followed by businesses since Hill et al. (2014) state that a stable competitive advantage can be achieved through the followed strategy which in turn can lead to higher profitability. Meanwhile, Grant (2008) associates the sources of the competitive advantage (Table 1) with Porter's general strategies noting that the sources of the competitive advantage define the two basic different approaches of business strategy.

Many researchers have connected competitiveness to business efficiency and have used efficiency indicators to quantify competitiveness (Irz & Jansik, 2015; Jansik et al., 2014; OECD, 2011). According to these researchers, businesses can improve their profitability which can be measured in relation to profit, development, market share and business duration (Heron & Robinson, 1993). Finally, the decision-making which forms the competitive advantage of big businesses is undertaken by top-level executives (such as managers and department heads) through the policies that each business sets but also through the organization and administration rules laid by theoreticians like Porter. Conversely, in small businesses which cannot afford to employ qualified executives, strategic decisions are usually made by the business owner (who is often unqualified) and correspond to the financial circumstances of the business. As a consequence, the competitive advantage emerges by chance (Papastathopoulos, 2009).

To measure competitiveness, Adam Smith placed cost (in particular absolute cost differences) as the single advantage (Brewer, 1999; Brewer, 2008) and then David Ricardo added to competitiveness the notion of competitive advantage (Poppe et al., 2007). On the other hand, Krugman and Obstfeld (1988) as well as O'Mahoney and Van Ark (2003) examined competitiveness as driven by productivity. At the same time, recent studies have added new aspects to analyzing competitiveness. Indicatively, these involve the financial performance of businesses (Barney & Hesterly, 2008), innovation (Dess et al., 2014), strategic orientation and the geographic location where the business is active (Porter, 1990; Barney, 2008; Thompson et al, 2014). In addition, various methodologies have used profitability, efficiency, management and value chain as factors affecting demand, as it can be seen in Table 1.

Performance measurements	The measurement factors are profitability, development, market share and trade balance.
Competitive potential	This refers to the availability and quantity of inputs which are related to efficiency.
Competitive process (Buckley et al., 1988)	Competitive process relates to qualitative characteristics and aims at measuring the process of management.
Industrial networks approach (Solleiro et al., 2005)	The interaction among businesses or with other organizations within a sector is evaluated.
Agribusiness complexes (Viaene, 1994)	Economic activities are emphasized.
Filiere Analysis (Raikes et al., 2000)	Filiere analysis compares business groups which present additional needs, while it assesses them in the light of their contribution to the entire system.
Porter's diamond (Porter, 1990)	Porters' diamond is based on the interaction among the following factors: strategy, factors affecting demand, factors' conditions, government, businesses which are related and support each other as well as random events.

Table 1. Methodologies for measuring competitiveness

Based on the above table, one can perceive the complexity and the difficulty in connecting all these parameters not only due to their high number but also due to the different methodologies used to determine competitiveness in a business or a business sector.

According to Cortimiglia et al. (2015), competitiveness can be described by the factors and methods which are related to it. In Porter's view (1990), they also interact with each other and in a limited scale study it is impossible to investigate all factors. Finally, to form a complete picture of competitiveness, all used factors must be concentrated in a single measurement model (OECD, 2011; Latruffe, 2010).

In view of the above, the present study focuses on three specific competitiveness factors: Strategic Orientation, Innovativity Degree and Financial Results.

The connection of these factors in a single model will consist a guide to business competitiveness in the food sector and specifically in the sector of cheese businesses in Greece.

The formation of the theoretical model

The validation of theoretical models has also been investigated in previous studies carried out in the food sector and these studies have led to the method of the Structural Equation Model (SEM).

To understand the potential sources of the competitive advantage so that businesses can design a successful strategy, Carraresi et al. (2011) examined the relationship between strategic choice and efficiency in food businesses in Italy. The results of the empirical analysis indicated that in the food sector strategic choices which are based on innovation, product placement and the development of chain relationships have a positive effect on business efficiency. Moreover, innovation plays a major role in the above because of its direct and indirect influence. In addition, in her study on the

agricultural sector, Chisasa (2014) noticed that productivity and efficiency increased through funding and developing agricultural businesses. Zheng & Li (2017) tried to explore the relationship between development strategies, innovation and efficiency in food businesses and their research showed that the low-cost strategy and the diversification strategy have a positive impact on the businesses' efficiency, but also on their innovativity level.

Based on the above, specific research hypotheses can be formed which refer explicitly to food industry and should be examined in a single model. These research hypotheses are:

- Strategic Orientation affects directly Innovativity.
- Innovativity Degree affects directly Strategic Orientation.
- Strategic Orientation affects directly Financial Results.
- Innovativity affects directly Financial Results.
- Financial Results affect directly Innovativity.
- Financial Results affect directly Strategic Orientation.
- Expenditures for Innovation affect directly Innovation.

On the basis of the above research hypotheses, the model can be graphically represented (Figure 1). In Figure 1, the variables are represented as rectangles and the arrows express the influence and/or interaction relationships among the variables.

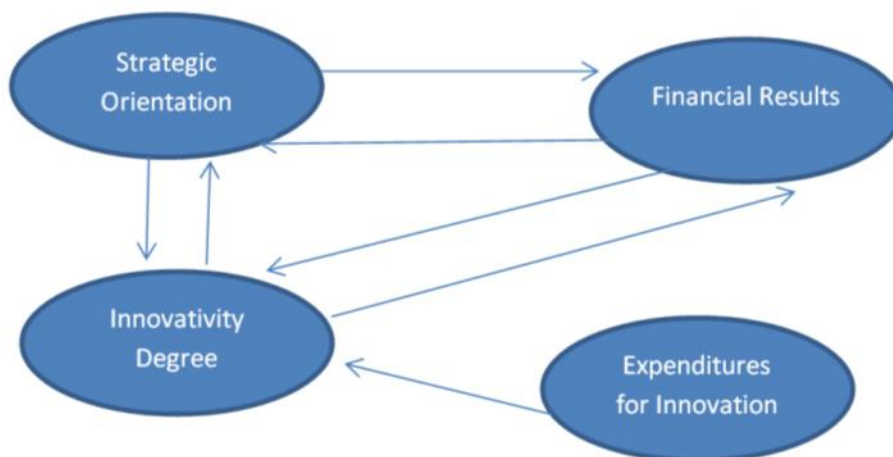

Figure 1: Theoretical-Conceptual Model Context

It can be inferred from the observation of Figure 2 that beside the previous direct effects among variables (see section 4.2), further indirect effects emerge which must be studied.

To validate the Theoretical model (Figure 1), an evaluation, representation and control method for the theoretical model is required. Hence, the Structural Equation Model (SEM) was chosen as the most appropriate method.

The application of the Structural Equation Model aims at investigating the parameters which affect the competitiveness of our sample's cheese businesses. This can be achieved through the effect of the Strategic Orientation, Financial Results, Innovativity Degree and Expenditures for Innovation. Hence, the relationships of the basic factors which consist the competitiveness of cheese businesses are analyzed.

The observed variables are illustrated with squares, whereas the existence of a linear relationship, namely regression, is represented with single direction vectors (Bentler & Weeks 1998).

The necessary data for the research were collected via questionnaire and were then analyzed with a certain methodology. Then, the Structural Equation Model was applied using the software package Amos. Moreover, the results are supported by the theoretical background.

Conceptual framework and the hypotheses of the research model

Based on research hypotheses which have been presented above, Figure 2 could be designed (referred to as conceptual framework and the hypotheses of the research model).

In this figure, one can see the observed variables while the single direction arrows illustrate the existence of a linear relationship among factors.

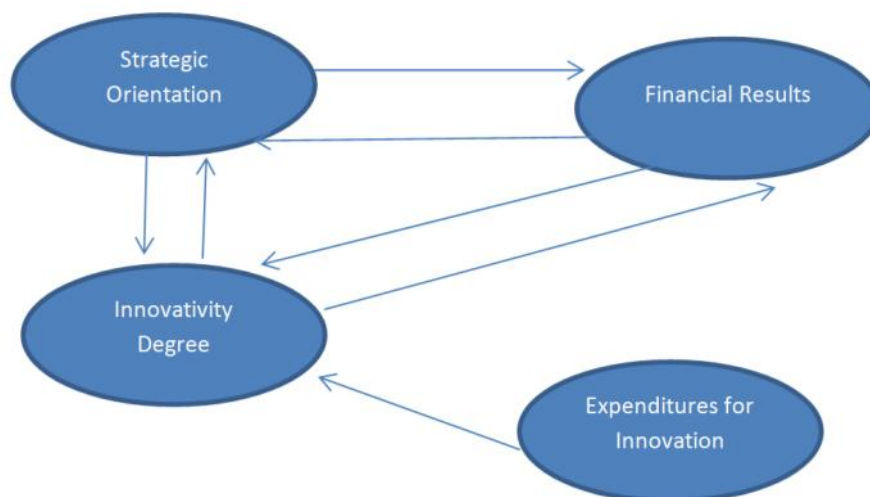

Figure 2: Conceptual framework and research model hypotheses

It can be inferred from the observation of Figure 2 that beside the previous direct effects among variables (see section 4.2), further indirect effects emerge which must be studied.

Hence, the research hypotheses are formed as follows:

- H₁₁: Strategic Orientation affects directly the Innovativity Degree.
- H₁₂: Strategic Orientation affects directly Financial Results.
- H₁₃: Strategic Orientation affects directly Financial Results through the Innovativity Degree.
- H₁₄: Strategic Orientation affects indirectly the Innovativity Degree through Financial Results.
- H₁₅: The Innovativity Degree affects directly the Financial Results.
- H₁₆: The Innovativity Degree affects directly Strategic Orientation.
- H₁₇: The Innovativity Degree affects indirectly Strategic Orientation through Financial Results.
- H₁₈: The Innovativity Degree affects indirectly Financial Results through Strategic Orientation.
- H₁₉: Financial Results affect directly Strategic Orientation.
- H₁₁₀: Financial Results affect directly the Innovativity Degree.
- H₁₁₁: Financial Results affect indirectly the Innovativity Degree through Strategic Orientation.
- H₁₁₂: Financial Results affect indirectly Strategic Orientation through the Innovativity Degree.
- H₁₁₃: Expenditures for Innovation affect directly the Innovativity Degree.
- H₁₁₄: Expenditures for Innovation affect indirectly Strategic Orientation through the Innovativity Degree.
- H₁₁₅: Expenditures for Innovation affect indirectly Financial Results through the Innovativity Degree..
- H₁₁₆: Expenditures for Innovation affect indirectly Strategic Orientation through Economic Results.

3. CURRENT SITUATION IN THE SECTOR

The food industry and particularly the sector of cheese businesses was chosen because of the significant role it plays in the Greek economy and its great developmental prospect.

According to the official data of the Hellenic Statistical Authority (2016), the sector of food industry is in the lead of the processing sector with a percentage of 19.6% of the sold products' overall value, while the contribution of dairies in forming the value of sold products in food industry is in the first place (for the years 2013 and 2014 it reached 21.2% and 21.5%, respectively).

In terms of the domestic consumption of cheese products, a rising trend at a rate of about 2% until 2016 was recorded and, at the same time, the value of the domestic cheese market is estimated at €1.7 billion for the year 2015 (ICAP 2013, 2014; E.T. 2015, Eurostat)

Moreover, according to the data of the Hellenic Statistical Authority, there is a longitudinal increase in the value of the exported cheese products during the last years (the increase reached 12.3% in 2014).

4. MATERIALS AND METHODS (DATA COLLECTION)

4.1 Data selection

The data regarding the number of cheese businesses were derived from the Greek Ministry of Rural Development and Food as well as the Greek Agricultural Organization "Dimitra". In addition, the data concern the financial year 2015 and the research was conducted in the last three months of 2016.

According to these data, 546 cheese businesses were operating in 2015 in Greece. Most of them were small- and medium-sized businesses with production lower than 200 tons (ICAP, 2016; ELGO-Dimitra, 2016). In view of the official data (ICAP, 2012; ICAP, 2016), the businesses often lack the required modern machinery, but also strategic orientation (Saubers et al., 2012). As reported by the relevant literature, because of these special characteristics these businesses are studied as particular categories of businesses and separately from other businesses (ICAP, 2012).

Due to this limitation the research was studied businesses whose production capacity exceeded 200 tons. In total, 68 businesses of this kind corresponded positively and participated in the study.

4.2 Questionnaire design and methodology selection

The data collection is based on structured questionnaires, scales and in-depth research studies, while the posed questions require clear answers. Consequently, there is little room for error and the statistical results can be interpreted. Hence, the researcher can be confident that the research will have a correct outcome (Cooper et al., 2008). In view of the above, it can be seen that the present study uses a quantitative method.

The primary data were collected via questionnaires which were completed by cheese businesses. This was a quite difficult process because the businesses presented high dispersion (ICAP, 2014; ICAP, 2016) and there was also a lack of registered data as well as of previous similar studies (Salavou, 2010).

Regarding the questionnaire, it consisted of two parts: the first part investigated innovation and was designed according to international manuals used for registering innovation (Oslo manual 2005, Frascati manual) and relevant questionnaires used by the European Statistical Service (Community Innovation Survey, 2010). The second part included questions designed to examine the strategic orientation of the surveyed businesses and was based on the methodology developed by Dess and Davis (1984). This way it was possible to define the strategic orientation of the studied businesses according to Porter's classification framework (Theodossiou et al., 2014; Sergaki et al., 2014; Salavou & Sergaki, 2013; Bourlakis, 2011; Salvou, 2010; Salvou & Halikias, 2009). To find the strategic orientation of each business, Principal Component Analysis was used. In specific, Principal Component Analysis was applied to examine the structural coherence of the variables that consisted the strategic orientation of each business (Hair et al., 1995; Cattell, 1978; Tabakis, 2001). More specifically, a score of strategic orientation was computed for every business using the Regression method (Hair et al., 1995). The same method was performed to process the data and extract financial indicators. Hence, in this study the following financial indicators were used: Circulation or Overall Liquidity index, Circulation Velocity Assets Index, Overall Leverage Index and Gross Profit Index (Niarchos, 2004; Atrill et al., 2006; Vasiliou & Iriotis, 2008).

5. RESULTS AND DISCUSSION

To ensure that our method would give the best results possible, measurements were carried out at two different models (Table 1 and Table 2) and the one that presented the best adaptation was chosen. The model's indicators with the best adaptation concerning the strategic orientation, innovativity degree and financial results are given in the table below:

Model	X ²	df [*]	p	X ² / df.	RMSEA	PCLOSE	GFI	AGFI	CFI
Proposed model	72.708	47	0.009	1.547	0.090	0.078	0.870	0.784	0.926
Requirement	Good confirmation model		> 0.05	< 2	< 0.05	> 0.05	> 0.900	> 0.900	> 0.900
	Adequate confirmation model			< 5	< 0.08				

Table 1: Model 1

Model	χ^2	df*	p	χ^2/df	RMSEA	PCLOSE	GFI	AGFI	CFI
Proposed model	72.738	48	0.012	1.515	0.088	0.078	0.869	0.787	0.929
Requirement	Good confirmation model		> 0.05	< 2	< 0.05	> 0.05	> 0.900	> 0.900	> 0.900
	Adequate confirmation model			< 5	< 0.08				

Table 2: Model 2

(*df: degrees of freedom)

Meanings of the abbreviations included in Table 1 and Table 2:

- RMSEA: Root Mean Square Error of Approximation
- GFI: Goodness of Fit Index
- AGFI: Adjusted Goodness of Fit Index
- CFI: Comparative Fit Index

The model presented in Table 1 meets the requirement for the value of the observed significance level p. Moreover, it meets the requirement for indicator χ^2/df and hence it can be considered it is confirmed adequately by the data. Additionally, as seen in Table 3, the index RMSEA does not meet the requirement for adequate model confirmation. However, the index PMSEA has a statistically significant difference from value 0.05 ($PCLOSE > 0.05$). Regarding the model in Table 2, it is indicated that it meets the requirement for the observed significance level p. As with the model in Table 1, this model also meets the requirement for indicator χ^2/df and thus it can be considered that the model is confirmed adequately by the data. In Table 3, it can be seen that the index RMSEA does not meet the requirement for adequate model confirmation, but it does not differ statistically significantly from the value 0.05 ($PCLOSE > 0.05$). Therefore, we can accept the eligibility of this model.

In addition, it is clear from Table 2 that the data relating to the confirmed data have an acceptable adaptation to the model which concerns the relationship among the factors of the food businesses' competition and more specifically the sample's food businesses.

Consequently, in line with the above results, the model corresponding to Table 2 has acceptable adaptation and is at the limit of validation which highlights the need for further investigation.

The research hypotheses presented previously in the section "Conceptual framework and the hypotheses of the research model" are illustrated in Diagram 1 (path diagram) which was developed according to the Methodology of Structural Equation Modeling.

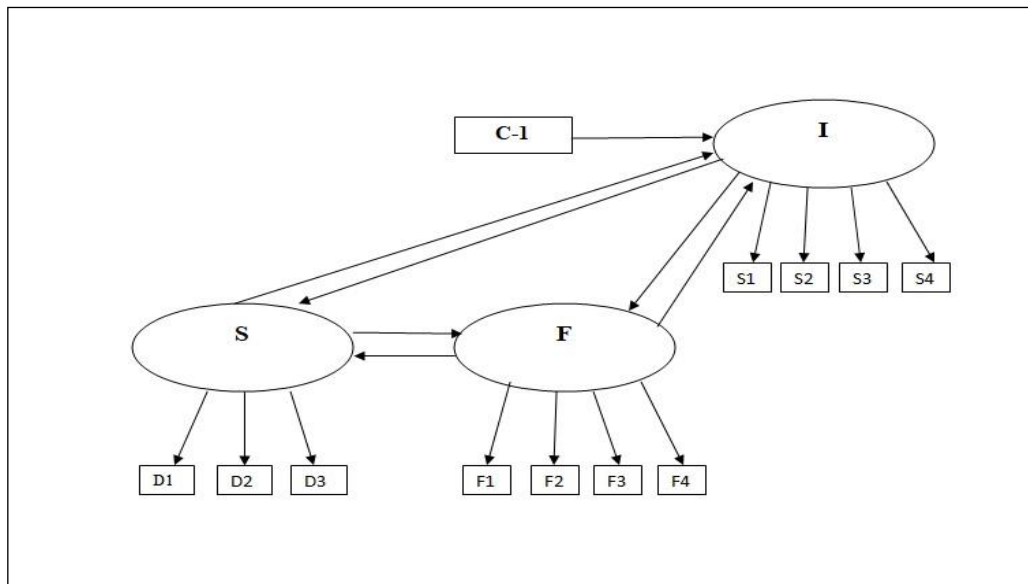

Diagram 1: Effects of factors affecting the competition of cheese businesses

Focus Strategy ← Strategic Orientation	.817		.698	.889	.021
Financial Results ← Strategic Orientation	2.028		1.189	3.430	.009
Financial Results ← Innovativity Degree	-1.147		-2.048	-.489	.013
Innovativity Degree ← Strategic Orientation	.612		.425	.838	.004
Strategic Orientation ← Innovativity Degree	.637		.325	.769	.038
Innovativity Degree ← Financial Results	-.101		-.282	.089	.335
Strategic Orientation ← Financial Results	-.613		-1.547	-.208	.022

Table 3: Values of regression coefficients in the Structural Equation Model and Statistical Significance (P) of indirect effects.

The regression model which consists part of the Structural Equation Model verified that there are relationships among most factors thereby confirming the theory. The regression coefficients (presented in Table 3) have a significance level of $P \leq 0.05$ and confirm the hypothesis in the correlation matrix. If that were not the case, the statistical correlation would not be statistically significant and thus the other would not be confirmed.

Results in Table 3 indicated the confirmation of the following hypotheses:

- H11: Strategic Orientation affects positively the Innovativity Degree (relative significance: 0.612).
- H12: Strategic Orientation affects positively Financial Results (relative significance: 2.028).
- H15: The Innovativity Degree affects negatively Financial Results (relative significance: -1.147).
- H16: The Innovativity Degree affects positively Strategic Orientation (relative significance: 0.637).

- H₁₉: Financial Results affect negatively Strategic Orientation (relative significance: -0.613).
- H₁₃: Expenditures for Innovation affect positively the Innovativity Degree (relative significance: 0.539).

As given in Table 3, the application of the model involves some further indirect effects which were investigated through the Structural Equation Model.

- H₁₇: Financial Results affect positively the Circulation or Overall Liquidity Index (relative significance: 0.751).
- H₁₈: Financial Results affect negatively the Circulation Velocity Assets Index (relative significance: -0.751).
- H₁₉: Financial Results affect negatively the Overall Leverage Index (relative significance: -0.997).
- H₂₁: The Innovativity Degree affects positively the Product Innovation (relative significance: 0.589).
- H₂₂: The Innovativity Degree affects positively the Innovation in Procedures (relative significance: 0.589).
- H₂₃: The Innovativity Degree affects positively the Innovation in Procedures (relative significance: 0.595).
- H₂₄: The Innovativity Degree affects positively Marketing Innovation (relative significance: 0.404).
- H₂₅: Strategic Orientation affects positively Cost Leadership Strategy (relative significance: 0.878).
- H₂₆: Strategic Orientation affects positively Diversification Strategy (relative significance: 0.972).
- H₂₇: Strategic Orientation affects positively Focus Strategy (relative significance: 0.817).

Results shown in Table 3 indicated that the following hypotheses were not confirmed:

- H₁₀: Financial Results affect directly the Innovativity Degree.
- H₂₀: Financial Results affect directly the Gross Profit Index.
- H₂₈: The Innovativity Degree affects directly Organizational Innovation (however the result can be considered marginal).

Next, Table 4 examines the indirect effects among variables.

	C1	S	I	F
S	.013			
I	.005			.047
F		.038	.014	

Table 4: The values of the regression coefficients in the structural equation model and statistical significance (P) and indirect effects

I: Innovativity Degree

F: Financial Results

S: Strategic Orientation

C1: Expenditures for Innovation

Results in Table 4 showed that the following research hypotheses were confirmed:

- H₁₄: Expenditures for Innovation affects positively Strategic Orientation.
- H₁₂₉: Expenditures for Innovation affect positively Financial Results.
- H₁₄: Strategic Orientation affects positively the Innovativity Degree.
- H₁₈: The Innovativity Degree affects positively Financial Results.
- H₁₁₁: Financial Results affect positively the Innovativity Degree through Strategic Orientation.

In addition, the results of Table 2 indicated that the following research hypotheses were not confirmed:

- H₁₅: Expenditures for Innovation affect indirectly Financial Results.
- H₁₃: Strategic Orientation affects indirectly Financial Results through the Innovativity Degree.
- H₁₇: The Innovativity Degree affects indirectly Strategic Orientation through Financial Results.
- H₁₁₁: Financial Results affect indirectly the Innovativity Degree through Strategic Orientation.

6. CONCLUSIONS

The main inference that can be drawn is that there are positive relationships among the Strategic Orientation, the Innovativity Degree and the Financial Results of the cheese businesses which

constituted the sample of the present research. Moreover, these relationships are consistent with our theoretical framework. However, there are some negative effects, such as the negative effect of the Innovativity Degree on Financial Results, which should be noted. In other words, the more innovative a business is, the lesser its financial results become (that is because innovation involves financial costs).

At the same time, Financial Results have a negative effect on Strategic Orientation which allows us to infer that changes in the financial situation of the business involves also changes in Strategic Orientation.

It is worthwhile also to note that the Innovativity Degree is not influenced by Financial Results. Namely, a business enjoying very good financial results might not be as innovative as a business having less good financial results. The latter makes more sense if one considers that we refer to businesses which have a low level of innovation and whose produced products are subjected to the consumer culture.

Finally, the results are based on a limited sample which despite being satisfactory should be increased to extract definite conclusions. This is more evident in the model which presents acceptable adaptation but is at the limit of validation. Moreover, the same research with the same parameters could be conducted in other food sectors to generalize the theory.

STRATEGIC TRANSFER PRICING RISK MANAGEMENT: NEW CHALLENGES AHEAD

Venturini, Stefano; Giovando, Guido

Dept. of Management, University of Turin, Italy

ABSTRACT

The paper deals with Transfer Pricing and it answers the call for specific studies investigating the relation between Management Control Systems and Transfer Pricing risk management. The research involves a multi-level case study carried out into a Multinational Enterprise based in North-West Italy.

Meanwhile data collection was being carried out, the selected MNE was under investigation by the Italian Revenue Agency on the matter of Transfer Pricing. The Authors had the opportunity to interview Group CFO and a member of the Board of Directors, directly involved in Transfer Pricing practices within the Group.

Findings show that MNEs are increasingly compliance oriented; international Groups' Top managers consider Transfer Pricing as a strategic tool to reach competitive advantages rather than a mere mean to reach tax savings. On the other hand, tax authorities are increasingly auditing Intangible related transactions, in line with the OECD reports, having gained a remarkable knowledge on Transfer Pricing practices.

MNEs adapt their Management Control Systems in order to better detect risky transactions and to elaborate better policies for the future.

MNEs, showing an increasing attitude toward compliant behavior and appear to be ready for Joint audits between different jurisdiction which would avoid double taxation risk and result into a mere reallocation of profit among different States.

Results foster the research on the topic of Transfer Pricing and provide useful insights to practitioners and Auditors.

Keywords: Transfer Pricing; Risk Management; Tax Compliance; Management Control System.

1. INTRODUCTION

The paper deals with Transfer Pricing, a topic that has been increasingly attracting attention by multinational enterprises and by tax authorities over the past decades.

Transfer pricing practices indeed involve the choice of the pricing policy for transactions occurring among entities from different countries but within the same Group and, therefore, the potential (mis)allocation of taxable income among different tax jurisdictions in order to obtain tax savings.

OECD (2017) developed “arm’s length principle” expressed in art. 9 of its model convention to prevent or to realign these undesirable outcomes. Under this principle, MNEs should set intercompany prices as independent parties would do.

Nowadays, most of the developed Countries have enforced comprehensive legislation on this matter and have introduced compliance requirements based on the Guidelines and recommendations provided by OECD (OECD: 2010; 2017).

As a direct consequence, tax authorities’ sensibility on this topic has increased as well as tax audits aimed to find harmful transfer pricing practices, especially after OECD issued its Base Erosion and Profit Shifting reports (BEPS) in 2013-2015 that culminated in 2017 revised Guidelines.

Thus, the main aim of this paper is to start investigating how MNEs deal with transfer pricing and how recent evolutions within this environment have affected – or are affecting – them from different perspectives.

As literature shows, indeed, from a strategic point of view, Transfer Pricing represents a potential source of risk in term of financial and reputational losses; while from an operational point of view, the management control system has to respond and to adapt in order to cope with the ever-changing legislative environment.

Case-study was selected as the most appropriate methodology to investigate the evolutions on the matter as well as to ensure practical outcomes and guidance for professionals working in the field and for tax authorities since the paper captures some of the main concerns and expectations for years to come that professionals expressed around this topic.

The remainder of this paper is structured as follow: section 2 presents the relevant literature on the topic; section 3 introduces the case study and explains the research design, the methodology adopted and the conceptual framework to interpret the findings. Section 4 presents findings while section 5 discusses them and draws the conclusions on this topic.

Acknowledgements

The Authors would like to wish their most grateful thanks to the Employees working at the Organization studied in the present paper. They have provided a major contribution dedicating their time, their passion and showing a true interest in this topic.

2. LITERATURE REVIEW

The topic of Transfer Pricing gathered the attention of many different actors in the economic panorama as it represents a key issue for Multinational Enterprises, Institutions (tax authorities) and practitioners around the globe.

Recent studies by Consultancy firms (Deloitte, 2018; EY, 2014; EY, 2016) indeed show as Transfer Pricing has become a priority on the agenda of MNEs and Institutions over the past decades and even more after the OECD issued the BEPS report and more specifically actions 8-10 (OECD, 2015).

Transfer Pricing indeed, is associated with several risks within Multinational Organizations (Miller, 1992), e.g. double taxation and reputational risk. Double taxation risk occurs when a First country requires a transfer pricing adjustment on income of an MNE while a second country involved does not accept a corresponding adjustment.

Reputational transfer pricing risk occurs when a Multinational Group suffers from a transfer pricing adjustment that becomes of public domain with negative downturns.

Thus, many Scholars too have dealt with this topic investigating organizations' behavior from different perspectives. For this reason, it is possible to identify many streams of Literature on the matter.

A first part of the Literature indeed shows that Multinational Organizations' transfer prices are affected by tax rates differences among the Countries (Borowski, 1997; Colling & Shackelford, 1997; Clausing, 2003; Grant, et al., 2013). Another stream of Literature, on the other hand, focused on the outcomes of transfer pricing policies on Multinational Enterprises results (e.g.: Picciotto, 1992; Cravens and Shearon, 1996; Nichols and Conover, 2000; Bartelsman & Beetsma, 2003; Hanlon and Heitzman, 2010; Klassen, et al., 2017).

Other Scholars then investigated the main determinants of transfer prices changes within the organizations (Boyns & Edwards, 1999) or price determination (Bouwens and Steens, 2016).

Lastly, a stream of Literature focused on the countermeasures adopted by different countries in order to deter harmful practices by Multinational Enterprises (Eldenburg & Joanne, 2003; Chan and Chow, 1997 and more recently Borowski, 2010; Buus, 2018; Bosung, et al., 2018).

Even if Transfer Pricing is commonly perceived as mean to obtain tax saving and related extra-profits by shifting income towards States that apply lower income tax rates (Sikka and Willmott, 2010), many Scholars showed the strategic relevance of this practice.

For example, Cravens (1997) shows that Executives of Multinational firms consider transfer pricing as a strategic lever to obtain competitive advantages towards competitors. Similar results are presented also by (Plesner Rossing and Rohde, 2010).

According to this point of view, Transfer Pricing practices within the organizations have been analyzed in depth by many Researchers.

As discussed above, Transfer Pricing is related to many risks within an organization, thus it has become vital over the past decades for MNEs to develop proper risk management practices also under the growing request of compliance by tax Administrations (Wunder, 2009). Compliance itself indeed is perceived as a risk within Organizations (Jost, et al., 2014).

In this sense, Hagigi and Sivakumar (2009) depicted an integrated framework for MNEs having to cope with exogenous and endogenous risks.

Literature also pointed out that a key success factor for risk management practices is the Management Control System "MCS" (Plesner Rossing, 2013): in this sense the Author elaborates on the *Levers Of Control* Framework proposed by (Ferreira & Otley, 2009) explaining how Intra and Inter-Organizational Interactions affect tax strategy and the Management Control System itself.

Despite all of these studies, major gaps still persist in Literature as shown by (Plesner Rossing & Carsten, 2014) in particular in understanding how MNEs deal with transfer pricing and how MCSs adapt to ever-changing tax context. Other gaps and open questions arise also in Martins (2017) that analyses the impact of new Accounting GAAP on comparables reliability.

This paper aims to fill the former gap and provide some insights about recent evolutions of transfer pricing practices.

3. METHODOLOGY

Research Design

The case study is guided by (Yin, 2009) (Yin, 2018). Case study research might be chosen when the research questions are "how" and "why" questions; when the researcher has no control over behavioral events and when he/she is focusing on studying a contemporary or new phenomenon. In other words, the case study is appropriate for an exploratory or explanatory phase of the research/investigation.

Moreover, case study represents an appropriate methodology when the research focuses on understanding real-world case in which the understanding itself is likely to involve conditions peculiar of the case analyzed as shown by (Yin & Davis, 2007). Therefore, case study methodology is open to the use of theory or conceptual categories that guide the research and analysis of data (Meyer, 2001) but it is also a reliable method to explore new theories (Eisenhardt, 1989).

Indeed, case study research guarantees for a holistic view of the process as argued by (Gummesson, 1988): "The detailed observations entailed in the case study method enable us to study many different aspects, examine them in relation to each other, view the process within its total environment and also use the researchers' capacity for 'verstehen'".

For these reasons, multi-level case study was adopted as a reliable method to observe real world practices and to explore new evolutions and patterns in Organizations.

In this case, the Research Question formulated is:

RQ: How do Multinational Enterprises deal with Transfer Pricing Risk and How are Organization responding to recent evolutions in this environment?

The case here presented analyses a Multinational Enterprise (hereafter also “MNE” or “Group”) headquartered in the North-West of Italy. The Group is involved in two main lines of business: (i) the production and sale of milling machineries and (ii) the developing of Numerical Control Software linked to the milling machine or sold apart and installed on third party machineries.

In addition, MNE provides many services related the machineries and software sold.

The first Company of the Group was incorporated in the 1970s, after a couple of decades of stable growth, it started opening subsidiaries in Europe, United States, South America and Asia. This led the Group to face Transfer Pricing issues since the early ‘90s and thus to develop strong competences on the matter that motivated us to select it for this research.

The Group is deemed to have own peculiarities, but the conclusions drawn from this case study are likely to be observed during future steps of research involving further Companies as they represent practices developed in many years of experience and proved effective in several tax audits.

Indeed, “Group” structure reflects a rather common organizational path in Multinational Enterprises that centralize their Research and Development activities as well as their manufacturing operations, selling through a web of subsidiaries around the globe.

In this case, MNE located R&D in Italy, as well as most of the manufacturing activities with minor part in China through a joint venture. Subsidiaries are located in France, Spain, Germany, Brazil, United States and China and perform mostly distributive activities. Moreover, they offer maintenance services. For the purpose of the present case study it must be mentioned that MNE’s products are highly customized to meet customers’ specific needs.

Data collection

The case studied was conducted from February to May 2019, after an extensive reading of the literature on the matter and after having selected “MNE” as a reliable subject for the case study, the research strategy was designed.

Due to the high sensitivity of the information reported in the present case study, the Authors agreed with top management at MNE not to publish or divulge the name of the Company.

The authors carried out structured interviews with the Chief Finance Officer at parent company of “MNE” who deals with transfer pricing on a daily basis inside the organization.

Then, the Authors interviewed one of the members of the Board of Directors at the Parent Company of “MNE”. More specifically, the Director deals on a daily basis with commercial matters. He gained a

remarkable experience in his 33 years within the Group. In particular, he spent many years in each of the subsidiaries and this represented a major strength for the case study.

Lastly the Authors had the occasion to meet the President of the Board of Directors for a short informal meeting on the topic of Transfer Pricing.

The interviews were structured based on the relevant literature before every meeting in order to cover all of the topics under investigation except from the one with the President of the board of Directors at MNE.

The main interviews were audio recorded (total 3 hours and 15 minutes) and then transcribed (the interviews were conducted in Italian, any sentence reported in the “findings” section has been translated by Authors). After the transcription, the interviews were coded to link more reliably each part of the interview itself with each topic.

In order to enhance the reliability of the study, the coding activity was independently replicated by each of the Authors.

The Authors also had the opportunity to analyze some relevant material and to discuss future opportunities and concerns within the Transfer Pricing area for “MNE”.

As said above, findings of this case study are likely to be observable also in other Multinational Enterprises.

Nevertheless, further case study may be replicated in different Multinational Enterprises in order to generalize results.

4. FINDINGS

Transfer Pricing Context

MNE has been developing its business outside Parent company’s territory through subsidiaries since the second half 1980s and therefore has been facing Transfer Pricing issues over the last decades in terms of price setting, formalization of intercompany Agreements and Tax authorities’ audits.

Transfer Pricing strategy at MNE focuses on dual objective: from a first point of view, MNE aims to comply with the main Regulation in each of the Countries involved in Intercompany transaction.

On the other hand, as also pointed out by the Group CFO, Transfer Pricing should represent a tool in order to achieve strategic goals balancing margin across the various subsidiaries.

Indeed, he argued that Transfer Pricing should represent, in an ideal world, *“the tool to reach the correct marginality in every subsidiary, which is functional to the final goal of the Group economic equilibrium”*.

Nevertheless, the CFO acknowledges that [Transfer Pricing] *“often represents a compliance tool that follows the business practices”*.

In this sense the Organization has developed a remarkable set of procedure in order deal with Transfer Pricing risks: indeed, both CFO and the Director highlighted that prevention is MNE's key success factor on the matter. The Director pointed out that the first complete analysis of the transfer pricing policy at MNE was conducted when opening the first subsidiary.

For example, MNE started to prepare documentation suggested by OECD well before the introduction of the rules avoid penalties in case of transfer pricing adjustment (in Italy penalty protection applies under art. 1, par. 6 of Decree 471/1997 since Tax year 2010).

This, helped MNE to develop a better documentation, refined in all of the aspects year after year, which created a standard inside the Company.

Despite this, it is worth noting that for the Master File Document, the Group still relies on external tax consultant, with a vast experience on the matter. *"This", argues the CFO, "is because the form is still very important when MNE has to explain its transactions to the Revenue Agency or to other Auditors"*.

Moreover, the pricing policy is subject to a complete revision at least every two years. This process involves not only Finance Area and board of Directors, but also many functions among the Parent company and each Subsidiary involved in each intercompany transaction.

The Director argues about this procedure that *"past experience suggested us to deal with price setting and price revision gathering around a table all of the representatives from the entities involved and from the different functions. An adequate and equilibrate discussion among different Directors and managers would more likely result into a price similar to a negotiation between independent parties"*.

Therefore, a preliminary questionnaire is sent to each of the functional area (Supply Chain, Logistics, Services Offices, Commercial). Each responsible then can make suggestions and give advices with reference to the transaction.

The questionnaire is also a valid support in order to understand whether relevant elements of the functional analysis have changed through the period.

Intercompany Sales of Goods

Part of the transfer Pricing strategy involves *"the consistency between the pricing policies with business transactions"*, argued indeed the CFO, *"that is a crucial element to support the fairness of our conduct. MNE aims to apply the same pricing policy for every typology transaction independently from the country of the subsidiary. Indeed, MNE has a unique price list which represents the base from which the price of every intercompany sale is calculated through a discount rate"*.

This policy may generate though, fluctuations among the margins between subsidiaries in different Countries and it may also alert the tax auditors during their audits, as happened in the recent audit. In fact, MNE has been inspected recently by the Italian Revenue Agency on the matter of transfer pricing (the Audit concluded with minor remarks during the period of our case study).

“The most difficult task that MNE has”, explained us the Group CFO, “is to convince the Auditor in Italy or in the other Country that our decisions were driven by business opportunities and, for us, every single machine sold is somehow a “different business” from the previous one”.

MNE, indeed, has a catalogue of standard products that are fully customizable by the final customer when placing the order. The customer has the opportunity to share its needs with the technician at MNE and develop its own machinery which is then assembled directly at the customer’s plant. To this extent every transaction may be considered different from the previous one.

Nonetheless, other elements must be taken into account: *“the Parent Company for example may sell one of his machineries to one of the subsidiaries realizing a tiny margin. This would probably be considered not acceptable by the Italian Revenue Agency, but the Intercompany sale may have been concluded anyway because the milling machine is going to be placed in one of the most advanced plants in the world and this will be an outstanding advertising for the Group”.*

As part of the revision procedure, recently, MNE has also started to analyze each relevant intercompany transaction involving the sale of milling machineries. This represents a correction of the Management Control System, which enables a useful “ex-post” analysis to drive future price choices.

Indeed, the CFO argued that *“we are conducting a profit analysis using big data and data mining that will help us to understand what are the most profitable machineries and the subsidiaries that have higher margin. This kind of analysis would also support a different price policy if we deem that a subsidiary is earning a margin higher than it should”.*

According to the CFO therefore, Transfer Pricing should be considered as an opportunity to reach a more in-depth knowledge of the Organization at MNE.

Transfer Pricing of Intangibles

Intangible and Value creation related to transfer Pricing analyses are central aspects of the recent Base Erosion and Profit Shifting report by OECS (2015). According to the OECD indeed, the profit allocation among the entities of a Multinational Group should reflect the contribution of every single entity to creation of value.

MNE centralized the entire R&D activity at the Parent Company’s facilities in Italy where the Group located the main manufacturing sites. Nevertheless, MNE carried out an analysis about a possible transfer of know-how from the Parent Company to its subsidiaries.

In this sense, the CFO explained that *“the mere sale of a machinery does not involve the transfer of know-how. When Parent Company’s technician provide services to foreign subsidiaries too, we do not transfer know-how”.*

It is worth noting that the Company adhered to the Patent Box regime, which allows to relief the part of the income that a taxpayer produces through the direct or indirect use of Intangible properties (or intellectual properties under L. 190/2014).

Under this regime, MNE concluded an agreement with the Revenue Agency in order to establish the correct amount of the profit gained from the use of the Intangibles.

Interestingly, the CFO argued on this topic *“Patent Box regime helped the Organization to carry out an extensive qualitative analysis of out intangible management”*.

The Analysis pointed out that MNE dealt with know-how and intellectual property correctly both with reference to external and internal subjects.

This helped to enhance the overall knowledge and the consciousness of the problems related to intangibles: indeed, according to the CFO: *“Employees are one the most important ingredient of MNE’s know-how”*.

Transfer Pricing and Financial Transactions

Financial Transaction have been recently analyzed by the OECD in a specific working paper (2018) related to the Base Erosion and Profit Shifting report.

We found that intercompany financial transaction are material within the Group: this mainly due to the unfavourable payment terms negotiated with final customer.

MNE experienced several problems dealing with intercompany financing activities due to differences among jurisdictions (for example MNE was not able to include into a cash pooling agreement some extra-EU subsidiaries).

Nonetheless, the Group was able to manage excess of cash in non-EU subsidiaries thanks to dividend policies of intercompany financing.

Neither CFO nor Director anyway were aware of the latest document issued by OECD.

Transfer Pricing and Tax Audits

The Parent Company of MNE had been under investigation of the Italian Revenue Agency during the data collection period. Eventually, the audit closed with minor consequences for the Group, which may be considered a proof of a fair management of the Intercompany transactions.

Starting from the on-going Audit we had the opportunity to share some thoughts with the Director and with the CFO about how MNE deals with tax audits.

Based on their experience, it emerged that they were mostly concerned by the attitude of the Auditors: indeed, Transfer Pricing practices should be determined (and audited) starting from the business point of view. Sometimes, they complained, the Auditors lack of a global vision and, as said also above, the hardest task for taxpayers is to explain the fairness of the economic reasons behind the transactions.

Nonetheless they noticed that over the past years Tax Auditors have improved their knowledge on the matter.

Moreover, the risk of double taxation arises serious concern at MNE: the CFO indeed acknowledged that Tax Audits carried out by a single jurisdiction lead to potential harmful conclusion for the Enterprises.

It would be much more desirable to face multilateral tax audits involving tax authorities from the jurisdictions interested by the transaction and the MNE Group: this would reduce without any doubt the risk of double taxation.

5. CRITICAL COMMENTS AND CONCLUSIONS

The case study gave significant insights about Transfer Pricing risk management in Multinational Enterprises.

First of all, findings confirmed the fact that Transfer Pricing is considered as a strategic tool coherently with previous literature (Cravens, 1997; Plesner Rossing and Rohde, 2010) and not only a mean to achieve tax savings through profit shifting.

Moreover, findings showed that Transfer Pricing strategies are focusing more and more on compliance oriented behaviours, as MNEs try to limit related risk (Jost, et al., 2014).

The MNE analyzed in the case appeared to be fully compliant with the current Italian Legislation: the top management showed interest on the topic and has proved to have a solid knowledge.

Nonetheless, the authors suggested a further review of the Intangible related transactions. Indeed, the revised version of the OECD Guidelines underline the importance of a correct profit allocation through a careful functional analysis having particular regard to the so-called "DEMPE" functions (Development Enhancement Maintenance Protection and Exploitation). In this sense for example (Peng and Lagarden, 2019).

It is worth noting that also different provisions are now affecting Transfer Pricing practices, such as Patent Box legislation.

This case study would also support contingency theory about Management Control System elaborated by Plesner Rossing (2013).

In order to answer to the Research Question, the case study shows that MNEs try to minimize Transfer Pricing risk through preventive actions and analyses. A strategic planning of the intercompany transaction, ex post analyses and compliance oriented programmes can lead to overcome tax audits without any double taxation or reputational downturns.

Also, in line with contingency theory, Management Control System adapt in Multinational Enterprises in order to respond to exogenous factors (e.g.: new regulation, new tax environment).

The case study suggests that MNEs are likely to evolve their MCSs in order to better detect risky transactions and to allow corrective measures to transfer pricing policies.

Lastly, OECD and Tax Jurisdictions are putting more and more pressure on MNEs requiring higher levels of disclosure. MNEs on the other hand are more and more compliance oriented and ready to face Joint audits involving more than one Jurisdictions. These would probably reduce the risk of double taxation, when no fraud is detected by Tax Authorities.

To conclude, this work answers to the call for analyses of Transfer Pricing practices within Multinational Enterprises. Even though the results are deemed to be likely observed in other Multinational Enterprises, further case study may lead to generalize them.

This paper can foster research on the matter of Transfer Pricing and to provide useful insights to both Practitioners and tax Administrations.

³Department of Accounting and Finance, Technological Educational Institute of Crete, Greece

ABSTRACT

This study investigates the performance of the k nearest neighbor (k NN) forecasts in the context of European tourism demand. The forecasting performance of neural networks is examined across different parameterisations of the k NN model. The selection of the most appropriate k NN parameterisation can produce more accurate forecasts. Tourism demand is forecasted monthly for twenty European countries. Tourism demand is measured via seven variables for the reason of consistency in results. k NNs better forecast tourism demand in shorter horizons; in specific, one month ahead. The parameterisation of the k NN model affects forecasting performance. More sophisticated parameterisations perform better than either an ARIMA model or a naive k NN parameterisation. The inclusion of international stock indices significantly increases forecasting accuracy. The more explanatory variables employed, the higher forecasting accuracy is retrieved. However, there is not a specific group of stock markets affecting more the k NN model's forecasting accuracy. The forecasting accuracy of k NNs differs between three (Western, Eastern and Southern) European regions.

Keywords: Nearest neighbor; Forecast; Europe; Tourism demand.

1 INTRODUCTION

Tourism planning in either a company or regional level is assisted by accurate demand forecasts. However, it was mostly after 2000 that literature started to systematically research tourism demand forecasting. Li et al. (2005) reviewed studies in tourism demand forecasting between 2000 and 2004. Song and Li (2008) reviewed tourism demand forecasting literature between 2004 and 2008. Many papers forecasted tourism demand via linear models, like ARIMA.¹ Tourism demand was also forecasted by autoregressive distributed log model

¹ See, Smeral and Wuger (2005).

(ADLM)¹, error correction model (ECM)², vector autoregressive model (VAR)³, or time varying parameter (TVP)⁴ models. The tourism demand was forecasted also nonlinearly via GARCH modelling in Chan, Lim and McAleer (2005). Neural networks (NN) have been employed in tourism demand forecasting only recently (Kon and Turner, 2005; Palmer et al., 2006; among others). Combining forecasting methods are nonlinear forecasting methods that have relatively recently employed in tourism. These methods combine either linear or nonlinear forecasts from other models. Wong, Song, Witt and Wu (2007) employed the variance-covariance, and the discounted mean square error combining methods. Recently, Shen, Li and Song (2011) employed the forecasting power of the simple average, the variance-covariance, the discounted-mean-square-error, the shrinkage error, and the time-varying parameter combining methods in forecasting UK outbound tourism demand.

Another nonlinear forecasting method is the k -Nearest Neighbor approach. k NN models, with their ability to adapt to data-imperfection, nonlinearity and arbirer function mapping, are a useful alternative to the the static regression forecasting models. The k NN forecasting method is based on the weighted average of the k nearest neighbors of the item predicted. Weights are proportional to the proximity of the neighbor to the predicted item. The forecasting accuracy depends on the choice of the number of neighbors (k) and the distance metric (Kulkarni, Lugosi, and Venkatesh, 1998).

The recent literature puts emphasis on the selection of the number of the k nearest neighbors. This selection is empirically examined internationally for industrial production. Literature has proposed different ways to select the number of k nearest neighbors. If the k value is too small eliminates important information; if it is too large results in noise that deteriorares forecasting accuracy.⁵ One of the first papers dealing with the appropriate number of k nearest neighbors is Stone (1977). In the present paper, RMSE and MAE loss functions are employed as distance metrics. Regarding the distance metric, see Basseville (1989). The k nearest neighbor regression method was recently empirically analyzed by Ahmed et al. (2010) in a comparative forecasting framework with other machine learning models. Wong et al. (2010) and Kulesh et al. (2008) adopt an adaptive k -nearest neighbors (AKN) method. More recently, a locally weighted regression was introduced by Li, Shen, and Xiong (2012).

Nearest neighbor predictions have been employed and analyzed by both practitioners and academic literature. Fernandez-Rodriguez, et al. (1999) extend nearest-neighbor predictors to allow

¹ See, Song, Wong and Chon (2003).

² See, Kulendran and Witt (2003).

³ See, Song and Witt (2006).

⁴ See, Li et al. (2006).

⁵ A large part of the forecasting literature is volatility forecasting. An influential paper from the latter is Lux and Kaizoji (2007). They compared the forecasting performance of long-memory models to GARCH and ARMA models upon the predictability of both volatility and volume for a large sample of Japanese stocks.

for a wider information set. Gencay (1999) proposed the use of technical trading rules to in-sample select the nearest neighbors. The k NN algorithm is a simple yet effective and hence commonly used classification algorithm in industry and research. Some recent studies are: Maggini, Giles, and Horne (1997), Yang, and Shahabi (2007) and Park, and Samworth (2008). The k NN method is also used to forecast histogram time series (Arroyo, and Mate, 2009). A most recent study on k -nearest neighbor forecasting is Zhang, Jank and Shmueli (2010) with an application to online auctions. Wichard (2011) proposed a combined forecast of a neural network, a nearest neighbor model and a nearest trajectory model as well for the NN5 time series competition data set. k NN can also be used for correcting imbalanced samples; a recent application to tourism is Li and Sun (2012).

The present paper does not concentrate on a forecasting competition. Forecasting competition studies have three limitations: (a) there is not a clear answer to which models should be examined instead of others; (b) in many cases, the forecasting method is assumed to be ordinary least squares (OLS); and (c) more heavily parameterised models are employed only when there are limited datasets available. Because of these limitations, the present paper empirically evaluates different model parameterisations of k NNs. k NNs are compared to the benchmark ARIMA model in terms of forecasting accuracy. The inclusion of the major international stock market indices as explanatory variables tries to raise the forecasting accuracy of the methods employed. It is also examined whether groups of regional stock markets, across the world and per continent, increase the forecasting accuracy of k NNs. The best parameterisation of the k NN method is revealed across twenty European countries and seven tourism demand measures. Three forecasting evaluation criteria provide consistency in results. European tourism demand is measured and forecasted in a monthly frequency.

The paper is structured as follows. In section 2 methodology describes the k NN forecasting model with the forecast evaluation criteria as well. In section 3 data is described. In section 4 the empirical evidence is presented, and in section 5 concluding remarks are provided.

2 METHODOLOGY

The main k NN modelling issues: number of nodes, hidden layers, hidden nodes, output nodes, activation function, training algorithm, training sample, test sample and performance measures (see, Palmer et al., 2006; and, Choudhary and Haider, 2012). The number of nodes, hidden layers, hidden nodes and output nodes are empirically selected. As activation function is employed a locally adjusted linear autoregressive model. Forecasts are retrieved in either univariate or multivariate level. The out-of-sample significance of inclusion of the explanatory variables is

examined.¹ The Levenberg-Marquardt backpropagation is the training algorithm employed.² 500 iterations are employed for optimization. Optimization is based on either root mean square error (RMSE) or mean absolute error (MAE). The twelve months of 2003 year was used as input. The remaining of the dataset is split into training-, validation- and test- sets. The validation set corresponds to the period from January 2011 to June 2013. The test- set corresponds to the last twelve months, from June 2013 to June 2014. The out-of-sample performance of either ARIMA or *k*NNs is evaluated via the Root Mean Square Error (RMSE) and the Mean Absolute Error (MAE) criteria. Both criteria have been extensively employed in the tourism demand forecasting literature.

One-month-ahead (monthly) forecasts are retrieved. The forecasting performance of a *k*NN model is examined across different parameterizations. Moreover, ARIMA model is employed as a benchmark. ARIMA was proposed by Box and Jenkins (1970). Smeral and Wuger (2005) found that ARIMA was a bad performer. ARIMA is selected as a benchmark forecasting model as far as it is the most accurate forecasting model in the tourism demand forecasting literature (see, Claveria and Torra, 2014; among others).

The methodology section focuses on prediction by nearest neighbor methods. The target of *k*NN is to find the *k*-nearest neighbors of a test pattern x ($x \in \omega$) in T based on a dissimilarity measure $d(\cdot, \cdot)$, and then classify the pattern x with the same label as the majority voting of nearest patterns in the training set. The *k*NN algorithm was introduced in Cover and Hart (1967). Let x_t ($t = 1, \dots, n$) be a finite time series. Vectors x^{m, τ_t} of *m* observations are sampled from the original time series at intervals of $\tau \in \mathbb{N}$ units.

$$x_t^{m, \tau} = (x_t, x_{t-\tau}, \dots, x_{t-(m-1)\tau})$$

$$t = 1 + \tau(m-1), \dots, n \quad (1)$$

where *m* is the embedding dimensions and τ the delay parameter. According to Takens (1981), $\tau = 1$ and

$x^{m, \tau} = x^{m, 1}$.³ Local predictions are generated by analyzing the historical paths of the vectors around the last available vector

$$x_n^m = (x_n, x_{n-1}, \dots, x_{n-(m-1)}) \quad (2)$$

¹ Athanasopoulos and Hyndman (2008) employed explanatory variables, like economic variables, dummy variables, in the regression function of the models employed.

² Law (2000), and Pattie and Snyder (1996) were from the first to adopt the back-propagation neural networks model. A more recent study on tourism demand forecasting via a back-propagation neural network is Chen, Lai and Yeh (2012).

The closest k vectors (3) are selected to maximise the function:

$$p(x_i^m, x_n^m) \quad (3)$$

Next, the predictors of the future evolution of x_n^m are simply estimates of x_{n+1} for the next observation.

The prediction x_{n+1}^f of x_{n+1} can be obtained using some extrapolation of observations:

$$x_{i1+1}, x_{i2+1}, \dots, x_{ik+1} \quad (4)$$

subsequent to the k NNs m -histories.

$$x_{n+1}^f = F(x_{i_1+1}, x_{i_2+1}, \dots, x_{i_k+1}) \quad (5)$$

Locally adjusted linear autoregressive predictions are employed for weighting:

$$x_{fn+1} = \alpha^0 x_n + \alpha^1 x_{n-1} + \dots + \alpha^{m-1} x_{n-(m-1)} + \alpha^m \quad (6)$$

Coefficients are fitted by Ordinary Least Squares. The regression is between the k NNs as in (3) on their future evolution. The \hat{a}_i are the values that minimize either (a) Mean Square Errors, or (b) Mean Absolute Errors. For example, MSE:

$$\sum_{r=i}^k (x_{i_r+1} - \alpha_0 x_{i_r} - \alpha_1 x_{i_r-1} - \dots - \alpha_{m-1} x_{i_r-(m-1)} - \alpha_m)^2 \quad (7)$$

For further details on estimation methods World than those two, see Casdagli and Weigend (1994), and Hastie, Tibshirani, and Friedman (2001).

3 DATA AND DESCRIPTIVE ANALYSIS

3.1 Data

Tourism demand can be measured by various variables: tourism revenues (Akal, 2004), tourism employment

(Witt, et al., 2004), tourism expenditure in the destination (Li et al., 2006) and overnight stays (Claveria and Datzira, 2010). Some studies in tourism demand forecasting filter data for removing trends and seasonalities.

However, there is part of the literature showed inconclusive evidence as to whether seasonality should be treated as stochastic or deterministic, and whether imposing seasonal unit roots may lead to more accurate forecasts (see, Coshall, 2005, and Alleyne, 2006). In the present paper, the null

hypotheses of a unit root and nonstationarity are rejected in a 5% significance level for all European countries and tourism demand measures. Moreover, as evidenced in Claveria and Torra (2014), there is a trade-off between the degree of preprocessing and the accuracy of the forecasts obtained with neural networks, which are especially suited to deal with nonlinear data. Here, data series are de-trended; however, no filter for seasonalities is employed. This is because, when data series are filtered heavily for accounting for the presence of seasonality and eliminating the existing outliers, k NNs produce less accurate forecasts. The broader economics literature has extensively studied the recent financial crisis starting from the housing sector in the USA. A plausible crisis effect is not irrelevant to tourism demand forecasting. Min (2005) examined the effect of SARS on tourism demand in Taiwan. However, the limitation for such impact analysis is in periods of successive crises. This is the case since 2008 for Europe. All European countries, for which tourism demand forecasts are produced, are still affected by the consequences of the financial crisis started in 2007. That is why, there is not any care, in the present paper, for the crises' effects in k NN forecasting.

The present paper examines the most out-of-sample accurate parameterization of a k -nearest neighbor model for seven tourism demand in twenty European countries as destinations and not as regions of origin (disaggregate data). Tourism demand is measured by seven different tourism accommodation variables.¹ These seven forecasted tourism demand variables are: the number of nights spent by both residents and non-residents at any tourist demand establishments ($ALL - ALL$), the number of nights spent by both residents and non-residents at any hotel demand ($ALL - HOT$), the number of nights spent by residents at any tourist demand establishments ($RES - ALL$), the number of nights spent by residents at any hotel demand ($RES - HOT$), the number of nights spent by non-residents at any tourist demand establishments ($NRES - ALL$), the number of nights spent by non-residents at any hotel demand ($NRES - HOT$), and the Net occupancy rate of bed-places and bedrooms in hotels and similar accommodation (%) ($NORBP$).

The twenty European countries, for which tourism demand forecasts are provided, are: Austria, Belgium, Cyprus², Czech Republic, Denmark³, Finland, Germany, Greece⁴, Hungary, Italy,

¹ Monthly number of nights spent in hotels were forecasted has been examined by Thawornwong and Enke (2004) and Teixeira and Fernandes (2012).

² The tourism demand of Cyprus as destination was researched in Bicak, Altinay and Jenks (2005) (in an annual frequency).

³ The tourism demand of Denmark as destination was researched in Song, Witt and Jensen (2003) and Witt et al. (2004); both in an annual frequency.

⁴ The tourism demand of Greece as destination was researched in Petropoulos, Patelis, Metaxiotis, Nikolopoulos and Assimakopoulos (2003), Dritsakis (2004), Patsouratis, Frangouli and Anastasopoulos (2005), Petropoulos et al. (2005). All these studies concerned annual data.

Netherlands, Norway, Poland, Portugal¹, Romania, Slovakia, Slovenia, Spain², Sweden³, and UK. Because, in most of cases, tourism policy makers have to make decisions in the short-run (in less than a year)⁴, monthly data series are employed and forecasts are retrieved one-month-ahead.

It is also examined whether four groups of twenty eight equity indices from around the World (*Europe, Americas, Asia, and World*) provide a significant additional explanatory power to the most accurate parameterization of a *k*-nearest neighbor model. The first group concerns twelve European equity markets (*Europe*): Austria, Belgium, Finland, France, Germany, Greece, Ireland, Italy, Netherlands, Spain, Switzerland, and

UK. The second group concerns four American equity markets (*Americas*): Argentina, Brazil, Mexico, and

USA. The third group concerns nine Asian equity markets (*Asia*): Australia, Hong Kong, India, Indonesia, Japan, Malaysia, Singapore, South Korea, and Taiwan. The fourth group concerns all international equity markets (*World*); including the *Europe, Americas, Asia* stock indices as well as the ones from Israel, Russia, and South Africa. The explanatory variables were de-meanned.⁵ The data series for all tourism demand measures and all stock (equity) market indices are available in a monthly sampling frequency for a decade starting in January 2003 and ending in June 2014.

3.2 Descriptive analysis

Both European tourism demand series and stock indices are descriptively analyzed through time series graphs and sojourn density plots. Time series or sojourn density plots depict the similarities and differences in the patterns between the countries of the same group. The twenty European countries for the seven tourism demand measures are split into three groups: *North* (Austria, Belgium, Denmark, Finland, Germany, Netherlands, Norway, Sweden, and United Kingdom), *East* (Czech Republic, Hungary, Poland, Romania, Slovakia, and Slovenia) and *South* (Cyprus, Greece, Italy, Portugal, and Spain).

Figures 1-6 are provided for analyzing the tourism demand (as measured by the two most indicative tourism demand measures as expected: *ALL – ALL* and *NORBP*) for twenty European countries in three groups (*North, East, and South*). The time series graphs for the *ALL–ALL* measure

¹ The tourism demand of Portugal as destination was researched in Rodrigues and Gouveia (2004), Gouveia and Rodrigues (2005). Both studies concern a monthly frequency.

² The tourism demand of Spain as destination was researched in Gil-Alana et al. (2004) (in a quarterly frequency), Roget and Gonzalez (2006) (in an annual frequency).

³ The tourism demand of Sweden as destination was researched in Gustavsson and Nordstrom (2001) and Salman (2003). Both studies concern a monthly measurements.

⁴ Examples are short-term business planning, staffing, stock management, etc.

⁵ Then, ADF-values revealed no unit root at a 5% significance level; no further trend.

are depicted in Figures 1-3, for the *North*, *East*, and *South* groups accordingly. The time series graphs for the *NORBP* measure are depicted in Figures 4-6, for the *North*, *East*, and *South* groups accordingly. The sojourn densities for the *ALL – ALL* measure are depicted in Figures 7-9, for the *North*, *East*, and *South* groups accordingly. The sojourn densities for the *NORBP* measure are depicted in Figures 10-12, for the *North*, *East*, and *South* groups accordingly.

According to the time series figures (Figures 1-6), the evolution of the nights spent in any tourist accommodation (*ALL-ALL*) and the net occupancy rate (*NORBP*) in time is really seasonal with a trend in most cases. European countries have their highest tourism demand in July.¹ There are two exceptions in Europe.

UK has the highest tourism demand in August and September.² The seasonal pattern for tourism demand in Greece changes between nights spent in tourist accommodation and net occupancy rate. The former tourism demand measure indicates highest tourism demand in December and January; whereas, the latter in July and August.

The sojourn density indicates whether the distribution of a series is the stationary density of the Markov chain. The sojourn density summarizes the long-term behaviour of the hidden-states: it quantifies the proportion of time spent by the system at each point in state-space (the so-called "sojourn time"). Sojourn densities characterize the time spent by the series in local neighbourhoods and can be estimated by nonparametric methods (see Phillips, 2001a and 2005, and Rust, 2005). Bulla and Bulla (2006) showed that the sojourn time distribution is the difference between a hidden Markov Model (HMM) and a hidden semi-Markov model (HSMM). A coherent analysis of sojourn densities is provided in Phillips (2001b). If there is irregularity in the sojourn density, there is a unit root; so, the data is not equally spaced in time. In the present paper, the discussion about the distributional properties of the tourism demand and equity indices is derived by sojourn densities.³ There is evidence of irregularity (not bell-shaped curves) in sojourn densities for tourism demand. The sojourn densities for the nights spent at any tourist establishments (*ALL-ALL*) are depicted in Figures 7-9 for the Northern, Eastern and Southern European countries accordingly. The sojourn densities for all European nights spent at any tourism accommodation are skewed at the right. Most of the sojourn densities for the net occupancy rate of bed-places and bedrooms in hotels and similar accommodation (%)

¹ Austria has many nights spent also in January, February and March. Finland has many nights spent also in June. However, they are still lower than the ones in July and August. Sweden has the highest number of nights spent only in July and not in August.

² UK has its highest net occupancy rate in July apart from August and September.

³ Because of the number of stock indices, graphs and sojourn densities for these indices are not included in the paper. However, they are available upon request.

(*NORBP*) are not rightly skewed. However, they are not bell-shaped either. Most of them have two peaks. This indicates nonlinearity in the time series. Moreover, the sojourn densities for the nights spent and net occupancy rates reveal a more complicated pattern in terms of nonlinearities for the latter. European net occupancy rates are depicted in Figures 10-12 for the Northern, Eastern and Southern European countries respectively.

Moreover, the presence of unit root is a common distributional characteristic between European tourism demand and international stock indices. All other distributional properties between these two groups of data series differ. This is the reason why, international stock indices have been employed to explain the European tourism demand. The problem of unit root is treated via the first differences in all data series. The European tourism demand is forecasted either without or with the inclusion of explanatory variables in any *k*NN method. Witt and Song (2000) suggested the inclusion of variables indicative to tourism demand. The present paper examines whether the inclusion of international equity indices improves European tourism demand forecasting. It is also examined whether a group of stock indices increases forecasting performance in the *k*NN methods. The following groups of stock indices are considered: *Europe*, *Americas*, *Asia*, and *World*. Each group of the first three concern the corresponding continents; whereas, the last group concerns all international stock indices. Table 1 analytically deploys the countries for which their major stock indices are the explanatory variables. Forecasting concerns a one-month ahead forecasting horizon. Forecasting takes place in either a univariate or multivariate level for any method employed.

4 EMPIRICAL FINDINGS

4.1 Research questions

Analytical empirical findings are depicted in Tables 2-13. Table 14 provides summarised results. Three evaluation criteria (MAE, RMSE, and DIR) have been employed. MAE is the mean absolute error. RMSE is the root mean square error. DIR is the percentage (%) at which the forecasts accurately predict the direction actual figures. Tables 2-4 provide the out-of-sample evaluation of tourism demand forecasts when the group of European equity indices (*Europe*) are used as the explanatory variables for the three evaluation criteria (MAE, RMSE, and DIR) accordingly. Tables 5-7 concern tourism demand forecasts with the group of American equity indices (*Americas*) as explanatory variables for the three evaluation criteria accordingly. Tables 8-10 present the evaluation of forecasts with the group of Asian equity indices (*Asia*) as explanatory variables for the three evaluation criteria accordingly. Tables 11-13 concern evaluation of forecasts when explanatory

variables are all international equity indices from all regions/continents (*World*) for the three evaluation criteria accordingly.

Many research questions can be retrieved from the empirical evidence. The ones answered in this section are the following:

(1) Indicate which model provides most accurate forecasts. The models AR, Naive, NNM1, NNM2, and NNM3 are symbolized as AR, M0, M1, M2, and M3 accordingly.¹

(2) Does any of the four different parameterisations of k -nearest neighbor models (Naive, NNM1, NNM2, and NNM3) retrieve more accurate forecasts than the ARIMA (AR) benchmark forecasting model? If this is true, it is symbolized by Y; Worldwide, by N. The benchmark forecasting model is an ARIMA model (in either univariate or multivariate level), for which the number of orders is selected according to the AIC information criterion.

(3) Which of the four (Naive, NNM1, NNM2, and NNM3) parameterisations of the k -nearest neighbor model returns the most accurate forecasts? The Naive parameterisation concerns nearest neighbors with automatic selection without explanatory variables, and estimated as a simple average on a default number of neighbors.² This is the only parameterisation without explanatory variables. The NNM1 parameterisation concerns nearest neighbors with explanatory variables and estimated as a simple average of the first k nearest neighbors. The NNM2 parameterisation concerns nearest neighbors with explanatory variables and estimated as a weighted average (by distance) of k nearest neighbors. The NNM3 parameterisation concerns nearest neighbors with explanatory variables and estimated as a simple average on a default number of neighbors.³ Four groups of the main equity indices of their corresponding countries' stocks exchanges are employed as explanatory variables. The equity indices data are indicated and graphically examined in section 3. The indication of the most accurate k -nearest neighbor forecasts for the Naive, NNM1, NNM2, and NNM3 parameterisations, is 0, 1, 2, and 3 accordingly.

(4) The orders for the k -nearest neighbor models (Naive, NNM1, NNM2, NNM3, and NNM4) are estimated by minimising either the RMSE or the MAE evaluation criteria. Is the Root mean square error (RMSE) or the Mean absolute error (MAE) loss function (e.g. equation 7) that provides more accurate forecasts? If none, the RMSE, or the MAE loss function provides more accurate k -

¹ The ARIMA model, for the remaining of the paper, will be notated as AR for simplicity reasons.

² The default number of neighbors is selected to be capped to 2% of the number of the out-of-sample period, which in its turn is capped to 1/3 the number of total observations.

³ The default number of neighbors is selected to be capped to 2% of the number of the out-of-sample period, which in its turn is capped to 1/3 the number of total observations.

nearest neighbor forecasts than the others, the 0, R, and M symbols are indicated accordingly.¹

For example, a result of M1-Y-1-R in any table indicates that a European country's specific demand measure is more accurately forecasted by the NNM1 (or M1) model. This result concerns a specific group of explanatory variables (*Asia*), when the evaluation takes place from the RMSE criterion as well as in either a univariate or multivariate level. Y indicates there is a k -nearest neighbor model that provides more accurate forecasts than the AR benchmark model. 1 signifies the NNM1 parameterisation is the most accurate parameterisation. R depicts minimising the Root mean square error (RMSE) loss function provides more accurate forecasts than the Mean absolute error (MAE) loss function.

4.2 Empirical evidence

In most of European countries, demand is better forecasted by the back-propagation neural network (or k -nearest neighbor) model compared to the ARIMA benchmark. This result is also evident in Chen, Lai and Yeh (2012). Athanasopoulos and Hyndman (2008) found that the inclusion of economic variables improves the forecasting performance of state space models in forecasting tourism demand. The inclusion of international stock indices as explanatory variables in k NN models improves the forecasting performance of this class of models. This result is evident in an either univariate or multivariate forecasting framework. Most of the explanatory variables are positively related to tourism demand. This means as the growth in the international stock markets increase the tourism demand in Europe.

5 CONCLUDING REMARKS

Summarized results are provided in Tables 14 and 15. Across all results, the k NNs forecast European tourism demand better than ARIMA. There is not clear evidence on which of the three parameterisations is best for k NNs forecasting European tourism demand. The results of the present paper contradict to the results of Claveria and Torra (2014), in terms of NNs performance. As indicated in the Empirical findings section, k NNs outperform ARIMA.² This result is evident regardless the inclusion as well as the selection of stock indices as explanatory variables. However, this result is evident on Cho (2003).

The NNM3 parameterisation, which concerns nearest neighbors with explanatory variables and estimated as a simple average on a default number of neighbors, provides the best forecasts when

¹ When neither of the RMSE and MAE loss functions can return more accurate forecasts than the other, the 0 symbol is used.

² The ARIMA model more accurately forecast tourism demand only in Northern Europe in a univariate forecasting framework.

European stock indices are explanatory variables. When either American or Asian stock indices are used as explanatory variables, the NNM2 parameterisation (which concerns nearest neighbors with explanatory variables and estimated as a weighted average -by distance- of k nearest neighbors) provide the best forecasts. When all international stock indices are explanatory variables, the NNM1 parameterisation (which concerns nearest neighbors with explanatory variables and estimated as a simple average of the first k nearest neighbors) forecasts best the European tourism demand. When forecast evaluation is implemented via the RMSE criterion, the best forecasts come from the RMSE-optimized k NNs.

The tourism demand in the Northern and Eastern Europe is better forecasted via the NNM2 parameterisation. In Southern Europe, there is not a clear-cut winner between NNM0, NNM2 and NNM3. The common outcome is that only k NNs can forecast accurately European tourism demand, regardless the geographical location of each European country.

TABLES

Table 1. Classification of dependent and explanatory data time series

Dependent-variables groups			Explanatory-variables groups			
North	East	South	Europe	Americas	Asia	World
Austria	CzechRepublic	Cyprus	Austria	Argentina	Australia	Israel
Belgium	Hungary	Greece	Belgium	Brazil	China	Russia
Denmark	Poland	Italy	Finland	Mexico	HongKong	SouthAfrica
Finland	Romania	Portugal	France	USA	Japan	
Germany	Slovakia	Spain	Germany		India	
Netherlands	Slovenia		Greece		Indonesia	
Norway			Ireland		Malaysia	
Sweden			Italy		Singapore	
UnitedKingdom			Netherlands		SouthKorea	
			Spain		Taiwan	
			Switzerland			
			UnitedKingdom			

Notes. Table 1 reports the classifications of dependent (country tourism demand) and explanatory (stock market indices) variables to three and four groups accordingly. Country tourism demand is measured via seven measures: (1) the number of nights spent by both residents and non-residents at any tourist establishments (*ALL-ALL*), (2) the number of nights spent by both residents and non-residents at hotels (*ALL-HOT*), (3) the number of nights spent by residents at any tourist establishment (*RES -ALL*), (4) the number of nights spent by residents at hotels (*RES - HOT*), (5) the number of nights spent by non-residents at any tourist establishment (*NRES - ALL*), (6) the number of nights spent by non-residents at hotels (*NRES - HOT*), and (7) the net occupancy rate of bed-places and bedrooms in hotels and similar tourist accommodation (%)

(NORBP).

Table 2. Mean absolute error (MAE) evaluation of *k*-nearest neighbor European tourism demand forecasts

Notes. Table 2 reports the forecast evaluation of seven tourism demand series for twenty European countries, via the Mean absolute error (MAE) criterion. Each of the reported values concerns the best forecasting evaluation across all *k*NN parameterisations, and across all selections of stock indices as explanatory variables. The forecasted tourism demand series are: the number of nights spent by both residents and non-residents at any tourist demand establishments series (*ALL – ALL*), the number of nights spent by both residents and non-residents at any hotel demand series (*ALL–HOT*), the number of nights spent by residents at any tourist demand establishments series (*RES – ALL*), the number of nights spent by residents at any hotel demand series (*RES–HOT*), the number of nights spent by non-residents at any tourist demand establishments series (*NRES–ALL*), the number of nights spent by non-residents at any hotel demand series (*NRES–HOT*), and the Net occupancy rate of bed-places and bedrooms in hotels and similar demand (%) (*NORBP*). Moreover, an average measure (*Average*) indicates the average result across all tourism demand series forecasted.

Table 3. Root mean square error (RMSE) evaluation of *k*-nearest neighbor European tourism demand forecasts

Notes. Table 5 reports the groups of international stock indices (if any), for which the most accurate tourism demand forecasts are retrieved for the Norther, Easter, Southern and Total European countries. The groups of international stock indices which are indicated as Europe, Asia, Americas and World, concern the European, Asian, American and World-wide (all) stock indices. - indicates there is no group of explanatory variables (stock indices) producing more accurate forecasts than the others. *NORTH*, *EAST*, *SOUTH* and *TOTAL* symbolize the group of stock indices with the most accurate *k*NN forecasts for Northern, Eastern, Southern and Total European countries, accordingly.

Notes. Table 7 reports whether the most accurate forecasts come from univariate or multivariate *k*NN forecasts. R depicts minimising the Root mean square error (RMSE) loss function provides the most accurate forecasts. M indicates the Mean absolute error (MAE) loss function most accurately forecast tourism demand. 0 indicates none of RMSE and MAE loss functions provide more accurate forecasts. Results are summarized for Northern, Eastern, Southern and Total European countries. Results are presented for all tourism demand measures. *All* indicates the results across the board of all tourism demand measures. Forecasts are evaluated via mean absolute error, root mean square error and a directional criterion. They are symbolized as MAE, RMSE and DIR in Panel A, B and C accordingly.

South	M2	M1	M2	M2	M0	M2	M1	M2
Total	M2	M0	M2	M2	M0	M2	M1	M2

Notes. Table 9 reports the *k*NN parameterisation with the most accurate forecasts. The Naive parameterisation (M0) concerns nearest neighbors with automatic selection without explanatory variables, and estimated as a simple average on a default number of neighbors. The NNM1 parameterisation (M1) concerns nearest neighbors with explanatory variables and estimated as a simple average of the first *k* nearest neighbors. The NNM2 parameterisation (M2) concerns nearest neighbors with explanatory variables and estimated as a weighted average (by distance) of *k* nearest neighbors. The NNM3 parameterisation (M3) concerns nearest neighbors with explanatory variables and estimated as a simple average on a default number of neighbors. Results are summarized for Northern, Eastern, Southern and Total European countries. Results are presented for all tourism demand measures. *All* indicates the results across the board of all tourism demand measures. Forecasts are evaluated via mean absolute error, root mean square error and a directional criterion. They are symbolized as MAE, RMSE and DIR in Panel A, B and C accordingly.

DIGITAL TECHNOLOGIES AND TECHNOSTRESSORS, A SURPRISING PARADOX FOR PRODUCTIVITY AND WORK/HOME CONFLICT

Washington, Montressa L.¹; Madden, Jennifer R.²

²Management & Marketing Department, Carthage College, Kenosha, WI, USA

ABSTRACT

Digital technologies are rapidly becoming a major fixture in both our work and personal lives. This study empirically validates the impact of information overload, technostress, and the role of presenteeism as key to determining the impact on productivity and conflict (between work-family and technology-family) related to digital technology use. This empirically tests new constructs related to technostressors and social media.

Keywords: technostress, work-family conflict, digital technology, social media, sociotechnical theory

INTRODUCTION

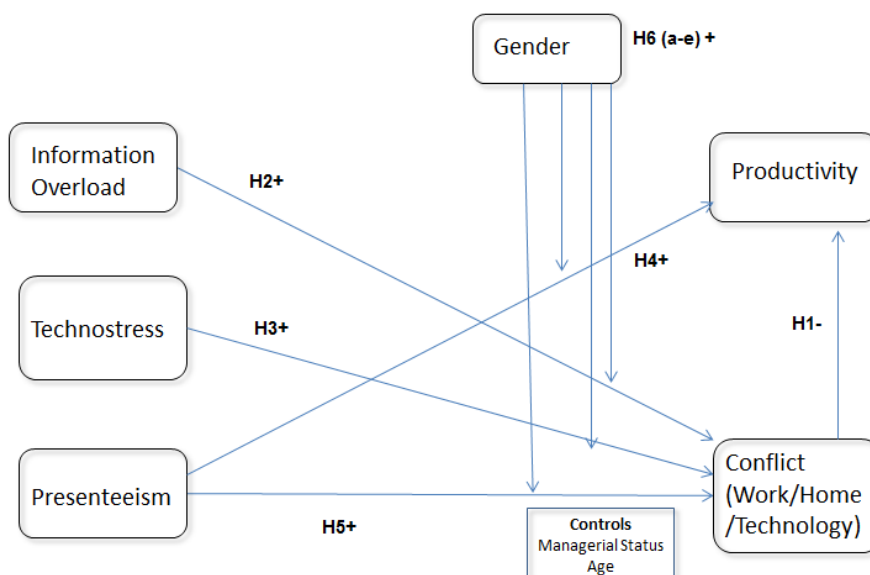

This study empirically validates the impact of information overload, technostress, and the role of presenteeism as key to determining the impact on productivity and conflict (between work-family and technology-family) related to digital technology use. Digital technology is transforming not only our personal lives but also the way we work. Technology is introduced into our personal lives and the workplace at rapid speed. This technology includes devices (i.e., tablets, smartphones); social applications (i.e., social networking and social media); or knowledge applications such as collective intelligence (e.g. crowdsourcing, crowdfunding).

Digital technologies such as cloud, mobile, data/analytics and social media are forcing companies to rethink how they compete and win customers. The demands and expectation of employees and management are increasing as technology/tools become more sophisticated and accessible. At the same time, technology is an integral part of our professional and family lives. A large body of research has considered the positive aspects of information technology (IT) use. However, research spanning more than a decade, along with emerging practice commentary, are focusing on the complex and often alarming ways in which use of IT affects organizational and social life. For example, studies found technostress having a significant negative impact on employee productivity (Tarafdar et al., 2007). Further complicating the impact is pervasive information and communications technologies (ICTs) enable us to get connected almost anywhere at any time. As a 2004 study correctly articulates, “[t]he diffusion of information and communications technologies

(ICTs) such as the Internet, the advanced wireless technologies and mobile communications networks have fundamentally changed our way of routine work and daily life (Hoffman, Novak, & Venkatesh, 2004)” (Wang et al., 2008: 3003). This has only intensified over the last decade. As digital technology permeates all aspects of organizational life, a grapple with IT enabled patterns of work and collaboration are emerging: (1) individuals have quick and easy information access that facilitate flexible work patterns versus (2) the growing potential for addiction, misuse, overuse, overload and stress brought on by increased digital technology use. The purpose of this study is to contribute to the understanding of these complex sets of social and individual uses of digital technologies across work and home settings, especially if such intensive, pervasive use is associated with non-beneficial and unintended consequences on work productivity and quality of home life.

RESEARCH MODEL & LITERATURE REVIEW

This research, informed by literature and previous empirical research, explores the impact on productivity and conflict on three key digital technology stressors: information overload, technostress and presenteeism. The researchers seek to understand the effect of information overload, conflict and presenteeism moderated by gender on productivity and conflict (work-family and technology-family). The research model is presented in Figure 1. The following section explores these impact areas individually, proposing their associated research hypotheses.

NOTE: Standardized estimates shown. *** $p < 0.001$; ** $p < 0.01$; * $p < 0.05$; ns=not significant.

Figure 1: Research Model

Social Media

“The use of social media technologies—such as blogs, wikis, social networking sites, social tagging, and microblogging —is proliferating at an incredible pace” (Treem & Leonardi, 2012: 143).

Although everyone is familiar with social media in one context or another, it is important to define social media from an operational perspective. Social media are technologies that have, “engendered radically new ways of interacting...there are literally hundreds of different social media platforms...social networking, text messaging, shared photos, podcasts, streaming videos, wikis, blogs, discussion groups...” (Hanna et al., 2011: 266). Consequently, social media is not a single sort of technology or a specific platform or application. Rather, social media is a communicative phenomenon that resides across a spectrum of different technology applications and platforms. It is this unique communicative aspect of social media that has given it such leverage within society as a functional utility of sorts.

In this regard, social media has become largely ubiquitous from a functional perspective and certainly in a communicative sense. Social media use has become perhaps the single most recognized form of interaction taking place across the internet and the World Wide Web (web) today. Social media is a compendium of all the social networking sites available through internet and web technology and is accessed through various technology platforms. The data indicates that 69% of adults use some form of online social media site (Pew Research, 2018). This is a large percentage of the population that have shifted some or most of their social interactions online from offline. While personal interaction among people remains the primary way for most people to interact, social media as communication channel has altered the dynamic of how and, perhaps more importantly, why people communicate.

Social media has replaced or, in some cases, created entirely new forms of communicative interaction among people. For instance, some researchers have identified three unique modalities of human interaction that occur within the context of social media (Ellison et al., 2011: 16-17):

1. Initiation in which social media behaviors are targeted towards initiating contact with new acquaintances
2. Maintenance behaviors in which people utilize the tools of social media to maintain friendships, contacts and conducting virtual interactions
3. Social media information seeking wherein social media is utilized to augment some relationship that exists offline

These three modalities of human interaction within the context of social media have largely worked to refine how social communication occurs in both the professional and the personal setting.

Technostress

The issue of technostress has become extremely relevant in the contemporary business environment as well as, to a lesser degree, in the personal environment. Technostress arises when technology being utilized by people in the workplace or even in their personal lives presents

significant barriers to practical and symbolic use. Technostress has been defined in the literature as being an inability for people to adapt adequately to new technologies in which they reject the technology outright or, alternatively, they become overly dependent upon the technology (Tarafdar et al., 2011). Either one of these scenarios is extremely damaging to an organization's capacity to compete in its given industry or market whether these are public or private in character.

In order to become fully cognizant of what constitutes technostress, one must first understand what constitutes stress. Stress is an element known to all members of an organization regardless of the environment in which the organization operates. Stress, in a universal sense, is a state that an individual experiences such that the individual believes that the circumstances being faced exceed his or her capabilities to manage them (Tarafdar et al., 2011: 306). Understanding this leads to a better realization of the qualities that comprise technostress. Yet, technostress has certain attributes that differentiate it somewhat from typical stress. Within the construct of technostress, there is the sense within the individual that the specific source of all the stress being experienced involves the technology being interacted with. Furthermore, this stress may involve fear and rejection of the technology and thus result in poor performance or it may involve the belief that the individual is worthless without the technology (Self & Aquilina, 2013). In either outcome, productivity suffers because of psycho-social aspects of the phenomenon involved in technostress as an established disorder.

Despite these reservations within the organization related to technostress and the clear implications that technostress has on individual productivity, many organizations continue unabated in deploying technology systems. There is an inclination on the part of some organizations to ignore some of the characteristics of collective technostress that can be experienced by employees because organizations often adopt the perspective that technology is the best way to manage the implicit assets of the enterprise. This is seen in the literature of knowledge management systems, where researchers have said that, "Technology based knowledge management systems are seen, by many, as the holy grail for ensuring that the crucial knowledge held by the staff in an organization is captured, codified and preserved for the benefit of the organization" (Self & Aquilina, 2013: 118). This knowledge then consists of the ideas, habits and practices of the staff within an organization that would otherwise be transferred either verbally or textually. The unspoken assumption then within the organization by both management and staff is that the people in the organization are somehow deficient without technological support.

Hypotheses Development

The duality (i.e., impact on both negative and positive outcomes) of technology use has not received adequate attention in prior research, especially as it relates to social media. The

pervasiveness of digital technology, in particular social media has created an environment in which working professionals have the potential to be available 24/7. The inability to “turn-off” digital technology activity can potentially lead to a decrease in individual productivity and an increase in family-work conflict. Factors that may impact individual productivity and family-work conflict include information overload, technostress and presenteeism. The effect of ICTs on stress in individuals is an important area of inquiry that is still in the early stages of investigation (Cooper & Cartwright, 1997; Cooper, Dewe, & O'Driscoll, 2001; Torkzadeh & Doll, 1999). Social media and other digital technologies have capabilities for ubiquitous and continual connectivity. The use of these leads users to feel that they are never free of technology, are always under supervision or “on call” (Clark & Kalin, 1996) as employees spend significant time connected. The workday tends to extend and enter into all other area of life. All of this may lead to a loss in individual productivity. Presenteeism is defined as the degree to which the technology enables users to be reachable. The underlying premise of this concept is that different ICTs offer different degrees of connectivity. Digital technology is enabled by smartphones and mobile technology which impact the pervasiveness of presenteeism. Evidence suggests that IT can contribute to burnout enabling employees to be accessible to the office anytime and anywhere through laptops, email, cell phone, etc. (McGee, 1996).

Direct Effects

Productivity

For many years productivity has been used as the justification for the selection and deployment of workplace technologies. The rationale being that employees within an organization become more efficient when provided with technology that makes them more effective at what they do. There is little doubt that technology does, at a fundamental level, increase individual worker productivity. This dynamic is evident in the data wherein overall worker productivity and overall employment were interrelated.

Increased usage of technology tools does not always lead to increased work productivity; rather, sometimes it actually can be counterproductive. An estimated 28% of our workday is consumed by interruptions propagated by technology which cost the US economy approximately \$558 billion a year (Spira & Goldes, 2007). For instance in 2009, Pew Internet and American Life Project coined the term “ambivalent networkers” to describe a growing population of Information and Communication Technology (ICT) users who feel over-connected. While 39% of Americans were adopters, 61% did not feel like ICT should play a bigger role in their daily lives (Vasquez, 2009).

Conflict

For the purposes of this paper, conflict refers to the tension that takes place between the use of technology that interferes with the home and family demands. Technology and specifically the

internet have facilitated a significant conflict between work demands for attention and home demands for attention in the employee. Often times conflict develops in which some employees resisting the organization's capacity to funnel work at them at all hours of the day and any day of the week. Simply put, the worry is such, "that by making it easier to blur the boundary between work and life, the Internet is disrupting the balance" (Coget, 2011: 95). Most employees do receive compensation based on an hourly wage so there is a legitimate fear of being asked to do work for the organization without receiving adequate compensation. Likewise, even salaried employees have an expectation that their home-life is protected in some way from the invasive nature of their work. While some people may not mind such intrusions, many others resent it and all would agree that if one is doing work outside of the workplace and accepted work hours, some form of compensation is appropriate.

Furthermore, there is the observation that failure to protect the integrity of one's home-life disrupts the work-home balance. This work-home balance has been shown to be instrumental in factors such as employee motivation, job satisfaction and quality productivity (Beauregard, 2011). In turn, employees within the organization that are highly motivated satisfied with their positions and who are productive tend to treat the organization's clients or customers much better. This has the added effect of improving the not only the productivity of the organization as a whole but its overall revenues or returns as well. A work-home balance that is in conflict or that is under threat from the organization tends to disrupt all of these human capital factors that are so important from the enterprise perspective.

Managing a work-home balance is extremely difficult in this always on environment. Technology clearly advocates tacitly for constant connectivity between the employee and the company irrespective of whether the employee at work or not and spending time with family or not. However, one unique aspect of technology is that just as it promotes an always on environment that detracts from a work-home balance, it can also provide a mechanism to improve such a conflict. One researcher says that, "The same tools that fuel more stressful job conditions also instantly connect us to our personal networks in ways that can foster greater levels of support, provide needed information... or even just give us a break from work (Chesley, 2014). Therefore, it is important to recognize that the underlying intention of technology itself has been positive but that the way in which many organizations have deployed it has been poorly designed and planned. Thusly:

Hypothesis 1. Conflict decreases Productivity

Indirect Effects

Information Overload

The concept of information overload is used in different contexts in the IS field. Irrespective of the context, information overload is generally associated with adverse effects. According to

Ayyagari (2012), "If the information provided by ICTs in an individual's work context (i.e. it can be due to emails, or access to knowledge-databases, etc.) exceeds the individual's perceived abilities to deal with this information, it reflects an imbalance in the equilibrium" (p. 19). Thusly:

Hypothesis 2. Information Overload increases Conflict

Technostress

The existing literature identifies several aspects of technostress, including work overload, individual life invasion... (Brod, 1984; Weil & Rosen, 1997). According to a report from Health Canada (Duxbury & Higgins, 2002) ICTs are linked to increased workload and almost no respondents in the survey reported that technology reduced job stress. The same case appeared for managers, over three quarters of managers in the survey felt that technology actually increased their workloads. Tarafdar et al. (2007) developed and validated a technostress measurement scale which defined five components of technostress describe typical situations where the use of computer technology can potentially create technostress. Thusly:

Hypothesis 3. Technostress increases Conflict

Presenteeism

Ayyagari et al. (2011) defines presenteeism "as the degree to which the technology enables users to be reachable" (p. 840). The underlying premise of this concept is that different ICTs offer different degrees of connectivity. According to McFarlane and Latorella (2002), ICTs are also seen as a source of interruptions in human-computer literature leading to reduced efficiencies and stress. The concept of presenteeism is one of the most widely discussed factors in the practitioner and technostress literature (Davis, Flett, & Besser, 2002; Kakabadse, Kouzmin, & Kakabadse, 2000; Ragu-Nathan, Tarafdar, Ragu-Nathan, & Tu, 2008; Tarafdar et al., 2007; Tu, Wang, & Shu, 2005; Weil & Rosen, 1997). The researchers contend that the ability to be accessible induces stress through stressors such as information overload, technostress and high engagement. It could be argued that the development of a work-home conflict stressor is due to the presenteeism characteristics of technology. Before the advances of digital technologies over the past decades, individuals' work life and home life were, for the most part separate from each other. Career oriented individuals are increasingly augmenting time spent at the office with work done at home made possible by different digital devices and applications. While constant connectivity might have benefits for some, it also comes at the cost of blurring work-home boundaries. There is growing evidence that constant connectivity of digital technologies is diminishing the quality of life to the extent that families are for example, using 'instant messages' to communicate with each other even when the individuals are in the same house (CNN, 2006). New technologies are seen as enabling blurring of boundaries between work and home (Mann & Holdsworth, 2003). Thusly:

Hypothesis 4. Presenteeism increases Productivity

Hypothesis 5. Presenteeism increases Conflict

Moderation Effects

Gender

According to some of the traditional IS studies, gender has a major influence on technostress. Men experience more technostress than women. In general, women find IS less easy to use than men (Gefen, Straub, & Boudreau, 2000). Women tend to use IS when they have to whereas men are more inclined to use IS when they want to (Venkatesh & Morris, 2000). Where use was voluntary, men were more inclined to use IS and hence experiences a higher intensity of technostress-creating conditions than women (Tarafdar et al., 2011). Gender (male, female) is selected as the moderator to observe differences in behavior for all variables. Thusly:

Hypothesis 6a. Controlling for the effects of Managerial Status & Age, the positive relationships between Conflict [WHTF] and Productivity [PROD] is stronger for M than F.

Hypothesis 6b. Controlling for the effects of Managerial Status & Age, the positive relationships between Information Overload [IO] and Conflict [WHTF] is stronger for M than F.

Hypothesis 6c. Controlling for the effects of Managerial Status & Age, the negative relationships between Technostress [TS] and Conflict [WHTF] is stronger for M than F.

Hypothesis 6d. Controlling for the effects of Managerial Status & Age, the positive relationships between Presenteeism [PRES] and Productivity [PROD] is stronger for M than F.

Hypothesis 6e. Controlling for the effects of Managerial Status & Age, the positive relationships between Presenteeism [PRES] and Conflict [WHTF] is stronger for M than F.

RESEARCH DESIGN & METHODS

Methodology

The researchers carried out a quantitative study to validate the research model. The study involved careful sampling of construct survey items from literature, assessment of the formative and/or reflective nature of the construct operationalization, survey pre-testing and hypothesis testing using SEM based statistical analyses. To test proposed hypotheses the researchers collected data using an online survey targeting full time working professionals who use social media/digital technology. The survey was based on anonymous self-reports of demographics, perceptions, attitudes, beliefs, feelings and productivity from respondents represent an efficient method to gather data (Teddlie & Tashakkori, 2009).

Construct Operationalization

Scale items for the independent variables group by IT Stressors (information overload, technostress, presenteeism) and the dependent variable group as impacts (productivity, conflict [work family/technology family]) were carefully adapted from literature based upon their theoretical relevance and reliability. The moderator variable is gender. All constructs were measured on a 5-point Likert scale ranging from 1=strongly agree and 5=strongly disagree. As previously used in the literature, all scale items were modeled as reflective. The specification for all scales were reflective (Jarvis et al., 2003).

Data was collected via an online survey using Qualtrics. The sample consisted of 300 qualified respondents (i.e., working full time professionals, over the age of 18, some familiarity with social media, etc.) contributed to the data analysis.

Structural Model

We tested our hypotheses using structural equation modeling (SEM) employing IBM SPSS and AMOS software version 21. We tested the hypothesized model and then eliminated non-significant relationships in order to achieve adequate model fit. From the suggested modification indices, two error terms were covaried (e1 to e2 which is P1_SM and P2_SM; and e7 to e8 which is TS3_SM and TS4_SM) resulting in a good fitting measurement model ($\chi^2= 261.476$, $df=191$; $\chi^2/ df = 1.369$; GFI=0.92; CFI= 0.986; RMSEA=0.035 and PCLOSE=0.994).

FINDINGS

Findings for this entire study are summarized in Table 1.

Table 1: Summary of Findings – Direct Paths & Moderation Test Results

Direct Paths			
	Hypothesis	Evidence	Hypothesis Supported?
H1	Conflict decreases Productivity	0.368 (***)	No
H2	Information overload increases Conflict	0.327 (***)	Yes
H3	Technostress increases Conflict	-0.150 (.012) **	Yes
H4	Presenteeism increases Productivity	0.254 (***)	Yes
H5	Presenteeism increases Conflict	0.150 (.012) **	Yes

Note: Standardized estimates shown; *** p<0.001; **p<0.01; *p<0.05; ns=not significant.

Moderation Effects				
	Hypothesis	Evidence (Male)	Evidence (Female)	Hypothesis Supported?
H6a	Controlling for the effects of Managerial Status & Age, the positive relationships between Conflict [WHTF] and Productivity [PROD] is stronger for M than F	Direct Beta = .451 (***)	Direct Beta = 0.289 (***)	Yes
H6b	Controlling for the effects of Managerial Status & Age, the positive relationships between Information Overload [IO] and Conflict [WHTF] is stronger for M than F	Direct Beta = .353 (***)	Direct Beta = .243 (.003) *	Yes
H6c	Controlling for the effects of Managerial Status & Age, the negative relationships between Technostress [TS] and Conflict [WHTF] is stronger for M than F	Direct Beta = -0.232 (0.005) **	Direct Beta = -0.106 (0.217) ns	Yes
H6d	Controlling for the effects of Managerial Status & Age, the positive relationships between Presenteeism [PRES] and Productivity [PROD] is stronger for M than F	Direct Beta = 0.262 (***)	Direct Beta = 0.233 (0.004)**	Yes
H6e	Controlling for the effects of Managerial Status & Age, the positive relationships between Presenteeism [PRES] and Conflict [WHTF] is stronger for M than F	Direct Beta = 0.165 (.044) *	Direct Beta = 0.148 (0.098) ns	Yes

Note: Standardized estimates shown; *** p<0.001; **p<0.01; *p<0.05; ns=not significant. M=males; F=females.

DISCUSSION

This study sought to provide empirical evidence on how certain IT stressors: information overload, technostress, and presenteeism impact productivity and conflict between technology and work/home. The results confirmed the following hypotheses: as information overload increases, conflict increases; when technostress increases, conflict decreases; when presenteeism increases, productivity and conflict increase. The hypotheses conflict decreases productivity produced a surprise result as it seems when conflict goes up productivity increases. The meanings are inherently negative; as technology is becoming so pervasive in our work and home lives, it is possible that working adult professionals are learning to cope with the stress of this technology.

Prior research of information systems usage is based on utilitarian systems such as personal productivity software and organizational applications (Lin & Bhattacharjee, 2010). "While the goal of many information systems is to increase productivity, hedonic systems are different" (Rosen & Sherman, 2006). Hedonic systems aim to provide self-fulfilling value to the user, in contrast to utilitarian systems, which aim to provide instrumental value to the user (van der Heijden, 2004).

As hypothesized, when controlling for managerial status and age, the relationships between information overload and conflict and information overload are stronger for males than females. The negative relationship between technostress and conflict is significant for males and insignificant for females. This may be attributed to recent studies that show women tend to multitask more than men (Offer & Schneider, 2011) and therefore better able to deal with technostress. The relationship between Presenteeism and productivity was slightly stronger for males than females. Presenteeism and conflict was significant for males and insignificant for females. With regards to social media usage, a

greater percentage of adult U.S. women use Facebook, Tumblr, Pinterest, Instagram and Twitter than their male counterparts.

Lastly, our research provided insights about how IT stressors: information overload, technostress and presenteeism impact productivity and work/family conflict. Managerial status seems to have an impact on productivity and conflict as these relationships were significant. The impact of age on conflict is significant for all respondents as well as males and females and may be suitable for further investigation.

**THE COLLABORATION & DESIGN THINKING GLUE BETWEEN ALL
DISCIPLINES: STRATEGIES FOR BUILDING EFFECTIVE
PARTNERSHIPS THROUGH A SYSTEMITIZED, NON-LINEAR
APPROACH CENTERED AROUND HUMANS**

ABSTRACT

Collaboration is recognized as a viable strategy for addressing uncertain, complex, and wicked social problems. Design thinking has emerged as the premier organizational path to innovation and high-performance collaboration. There are similarities between designers and collaborators, we conjecture that adopting design strategies is an important foundation for building successful collaborations. Further, we propose collaborative technology is also critical for successful collaborations. This study explores collaboration from a design and technology perspective. We propose to conduct qualitative semi-structured interviews with participants from collaborations to explore if design, design thinking, collaborative discourse and collaborative technology was adopted to build better collaborations.

Keywords: Designing collaborations, design, design thinking, cross-sector collaboration, cross-sector partnerships, public-private partnerships, collaborative discourse, mental models, collaborative technology, power, leadership, experience.

INTRODUCTION

Collaboration is recognized as a viable strategy for addressing uncertain (Caplan, 2005; Pich, Loch, & De Meyer, 2002), complex (Bryson, Crosby, & Stone, 2006; Roberts, 2000), and wicked (Roberts, 2000; Weber & Khademian, 2008) social problems. The more general literature on collaboration is vast and much of it is applicable to and useful for understanding how to structure effective collaborations. Further, the literature points to several important variables argued to affect the success or failure, three being power distribution amongst partners (Berger, Cunningham, & Drumwright, 2004; Bryson et al., 2006; Gray, 1989) leadership (Ansell & Gash, 2008; Armistead, Pettigrew, & Aves, 2007; Crosby & Bryson, 2005), and prior experience (Austin, 2000; Berger et al., 2004).

We suggest that more recent literature on design (organizational design, managing as designing, design-driven innovation) and design thinking may yield insights about building better collaborations. Design is a comprehensive approach to problem solving and transformation (Bevan, Robert, Bate, Maher, & Wells, 2007) with the purpose of developing solutions that don't exist by changing existing conditions to desired situations (Romme, 2003). "Design thinking...has emerged as the premier organizational path not only to breakthrough innovation but...to high-performance collaboration, as well" (MIT Sloan Management Review 2009, p.: 1). Finally, we propose collaborative technology is another contributing success factor.

We propose to conduct qualitative research based on semi-structured interviews with participants from ten collaborations charged with addressing wicked problems to explore if design, and design thinking has been adopted to build better collaborations and solutions. Learning more about successful (and unsuccessful) collaborations may reveal design differences that can increase the likelihood of success. Our findings may be useful to public, private, and nongovernmental organizations (NGO) in designing and managing effective collaborations.

RESEARCH QUESTION AND CONCEPTUAL MODEL

How are collaborations designed (and redesigned) by participants and to what extent is collaboration design affected by partner characteristics such as power, leadership, and experience? How does design thinking moderate this influence? What impact does collaborative technology play? What is the importance of collaborative discourse? These research questions are depicted graphically in Figure 1.

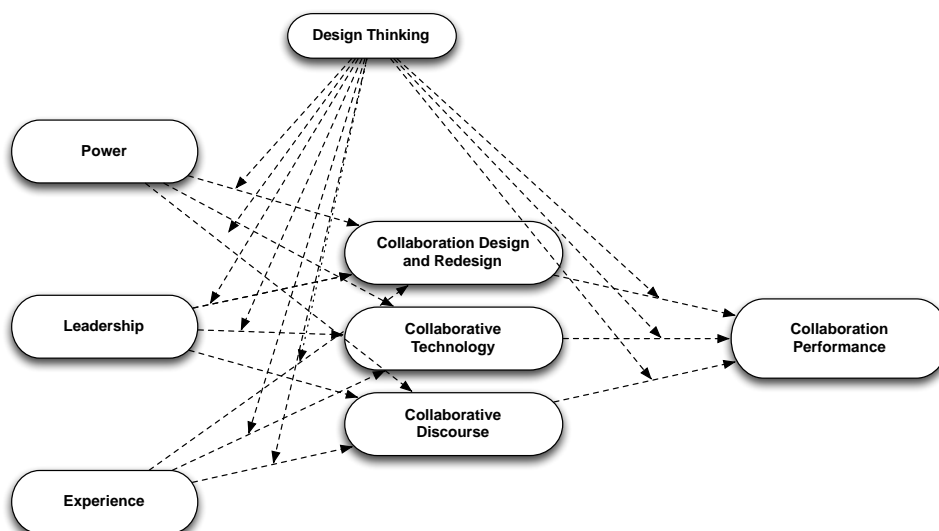

Figure 1. **CONCEPTUAL MODEL**

Collaboration is "a process in which autonomous or semi-autonomous actors interact through formal and informal negotiation, jointly creating rules and structures governing their relationships

and ways to act or decide on the issues that brought them together..." (Thomson, Perry, & Miller, 2009, p.: 25). Cross sector collaborations or public private partnerships are also considered as forms of collaboration. Nonprofit organizations include the NGO in this research. Collaborations for this study may be any of these types. How these collaborations are designed and managed is the focus of our study. Our model suggests that partner power, leadership and experience may influence the design of cross sector collaborations and that how they are redesigned may affect collaboration outcomes.

CONCEPTUAL FRAMEWORK

We begin this section with a brief discussion about benefits and challenges of collaboration and typical solutions developed through process models and structure. Thereafter we provide examples of the influence of design thinking on the private sector and the NGO, describe design fundamentals, and provide an overview of organization design and the importance of redesign. We conclude with a section on collaboration from a design perspective including a discussion on power, leadership, and experience.

Collaboration

Collaborations range from a one-time transaction to a full legal merger of two organizations based on formality, information sharing, facility sharing and the offering of joint programs (Guo & Acar, 2005). In theory, cross-sector collaborations should combine the best of what each sector brings to them (Rosenau, 1999). As Ghere (1996) observes, there is consensus in the literature that government does some things best, the private sector other things, and the NGO still different things. Still, important differences between the sectors can challenge collaboration. A recurring theme in the literature, for example, is that the NGO is mission driven while the for-profit partner is profit driven (Selsky & Parker, 2005) – posing potential conflict of interests. Visions of mutual benefit, common desire by partners across sectors to address complex social problems (Pasquero, 1991) and shared feelings of responsibility (Bryson et al., 2006; Selsky & Parker, 2005), however, may promote conceptualized synergy (Huxham, 2003), the sense that something will be achieved that could not have been attained by any of the organizations acting alone (Huxham, 2003; Huxham & Vangen, 2002).

Collaboration structure can be ambiguous, complex and dynamic (Huxham, 2003) – ambiguous because of lack of clarity on partner roles and expectations, complex because of individual partner identity or because partners may be engaged in other collaborations or partnerships, and dynamic because partners or partner purpose may shift based upon internal or external influences. The literature is replete with process models for collaboration. According to Gray (1989) the process involves problem solving, direction setting and implementation and, as described by Gajda (2004)

follows the simple stages of assemble, order, perform, transform and adjourn. While Waddock (1989) sees the process as evolutionary and needing partnership, issue crystallization, establishment and maturity, Huxham (2003) views it as a cyclical process involving communication, trust, commitment, understanding and outcomes. The partnership decision-making process, in particular, Chung has argued, "... generally involves three decisions: do I partner, with whom do I partner, and what is the partnership structure" – but, she cautions, the decisions are not made systematically (Chung, 2004, p.: 1). Overall the literature suggests that the collaboration process is iterative and more cyclical than linear (Ansell & Gash, 2008). Process transparency is also an important feature (Busenberg, 1999; Glasbergen & Driessen, 2005) indicating the need for legal agreements, contracts and procedures that define partner relationships (Pongsiri, 2002). Moreover, negotiating formal and informal agreements regarding purpose following initial agreement on defining the problem is a key process for collaboration (Bryson et al., 2006). Bryson contends that formal agreements support accountability.

While structure and process have been argued as critical collaboration features, structure has attracted limited and process the majority of scholarly interest (Bryson et al., 2006). Contingency theory examines structure in relation to other elements of collaboration (i.e., context, environmental factors, or purpose), but little research has addressed design as key to the collaboration process (Ansell & Gash, 2008). Previous inquiry into the problems encountered by participants in cross sector collaborations has not solved an important problem of practice – how to overcome imposing challenges to their effectiveness.

Influence of Design Thinking on the Sectors

Many private sector firms, such as McDonalds, Apple, Steelcase (Martin 2009, Verganti 2009), Research in Motion (the creators of the Blackberry), Proctor & Gamble, and Cirque du Soleil (Martin 2009), have benefited from design thinking and design driven innovation – but the concept is newer to other sectors. Still, while the average nonprofit organization, for example, has limited access to and knowledge of design expertise, and collaborations between NGOs and design firms are neither affordable nor routine (Rockefeller 2008), there has been some recent collaboration between the two to address social problems. As observed by Brown and Wyatt (2010, p.: 31), "Designers have traditionally focused on enhancing the look and functionality of products. Recently, they have begun using design tools to tackle more complex problems, such as finding ways to provide low-cost healthcare throughout the world. Businesses were first to embrace this new approach—called design thinking—now nonprofits are beginning to adopt it too."

Design thinking, described as "the single most important business concept to emerge from the 20th century" (Oster, 2008, p.: 111), thus may positively impact collaboration outcomes. Like cross-sector collaborations, design, "...helps to bring together people from different disciplines and

practices to jointly pursue a vision and boldly experiment..." (Avital & Boland, 2008, p.: 2). Designers, not unlike cross sector collaborators, focus on "wicked problems" defined as a "class of social system problems which are ill-formulated, where the information is confusing, where there are many clients and decision makers with conflicting values, and where the ramifications in the whole system are thoroughly confusing" (Buchanan, 1992, p.: 15). Given the similarities between designers and collaborators, we conjecture that design thinking could, in particular, have considerable influence on cross sector partnerships for social innovation.

Design Fundamentals

Herbert Simon highlighted the fundamental importance of design and management in his classic book *The Sciences of the Artificial*, noting that "the natural sciences are concerned with how the things are" while design science "is concerned with how things ought to be" in order to attain goals (Simon, 1996, p.: 133). Simon argued that natural sciences show complexity as a mask for simplicity with the goal of finding patterns hidden in apparent chaos, while complexity theory (embraced by design science) suggests well chosen design rules can shape resilient and productive processes. "That is, rather than developing detailed recipes for permanent solutions, effective design points to a handful of simple rules and key processes, easy to vary and configure" (Jelinek, Romme, & Boland, 2008, p.: 322). Said differently, design is the study of the artificial world whose methods include models, pattern-formation and synthesis, and values include concern for appropriateness, practicality, ingenuity, and empathy (Cross, 2007).

Design is found in four broad areas of everyday existence: symbolic and visual communications, material objects, activities and organized services, and complex systems or living environments (Buchanan, 1992), suggesting that design "...is desperately needed in, and applicable to, our most significant human activities...", that design "make things right" and "creates things and places that work" (Caplan, 2005, pp.: xv, 4). Basic design questions include: "What do you want to accomplish? What are the materials you have to work with? Who are the people involved? What do they need and want? If this is the problem, what might a solution look like? What form might it take? What form can you give it?" (Caplan, 2005, p.: 162). Design is distinctive in that it has "things to know, ways of knowing them, and ways of finding out about them" (Cross, 2007, p.: 17). The central concern of design is "the conception and realization of new things", including the appreciation of "material culture" and "planning, inventing, making and doing" with a core language of "modeling" (Cross, 2007, p.: 17).

Human-made or artificial (as opposed to scientific) phenomenon aimed at changing an existing situation to a preferred one, (Simon, 1996) may be better managed with a "design attitude" (Boland & Collopy, 2004a). A design attitude moves beyond default solutions and ordinary systems

of logic based upon how things are (Boland & Collopy, 2004a), by “devising artifacts to attain goals” that are “concerned with how things ought to be” (Simon, 1988, p.: 69). Design thinking is identified as understanding (reflection, analysis, diagnosis and description), imagination and visualization (modeling, planning and prototyping) and action and implementation (Bevan et al., 2007). Managing as designing is the integration of design thinking, and design skills in search of new possibilities, based upon the desire to achieve something better than had been done before (Boland & Collopy, 2004b). Management by design involves design attitude, design vocabulary, recognition of the importance of artifacts or models, and redesign (Boland 2008).

Organization Design

Ideas and values regarding the design process outlined from organization design suggest that information be limited (in order to prevent excessive data gathering and the creation of experts on existing problems instead of designers of new solutions); participation and involvement in decision making and implementation (because it is important that those implementing the solutions help to create them); dialogue and discourse as the medium for intervention that leads to changes in systems and practices; and pragmatic experimentation (which means challenging conventional wisdom to design and develop new useful alternatives i.e., reinventing the wheel) (Romme 2003). Design, a comprehensive approach to problem solving and transformation (Bevan et al., 2007) and the creation of a larger sense of purpose, emphasizes creating something new (Romme, 2003). Romme argues that design research develops knowledge, and that “the pragmatism of design research can be expressed in more detail by exploring the normative ideas and values characterizing good practice in professions such as architecture, organization development and community development” (Romme, 2003, p.: 562) “The idea of design involves inquiry into systems that do not exist – either complete new systems or new states of existing systems” (Romme, 2003, p.: 558). Three ideas and values that define the content dimension of design inquiry include assuming each situation is unique, focusing on purpose and ideal solutions, and applying systems thinking (Romme, 2003).

The first idea – the assumption that each situation is different and embedded in a unique context of related problems – suggests that the problem is ill defined or wicked, meaning there is insufficient information available to arrive at a solution (Romme, 2003). The second idea, focusing on purpose and ideal solutions, mitigates the problem situation from being overwhelming, and encourages creativity and expanded thinking (Romme, 2003). Moreover, elements of ideal long-term solution may be usable today even if they are not implemented immediately (Romme 2003 referencing Nadler and Hibino 1990). The third idea, applying systems thinking, reinforces that problems are embedded in a larger system of problems.

Redesign

Just as thinking humans are adaptive systems whose goals are an interface between their internal and external environments (Simon, 1996), managing by designing is also recursive and good organizational design is dynamic requiring continual redesign (Boland Jr, Collopy, Lyytinen, & Yoo, 2008). Galbraith 1995 supports this idea stating that organization design is not a “single event”, but a continual process that requires “the continuous monitoring and assessing of the fit between goals, structure, and rewards; the creation and choice of alternative actions when there is no fit; and the implementation of the chosen design” (Galbraith, 1977).

Effective organizational design is achieved with strategic fit (Galbraith, 2002). Organizations are constantly being designed and redesigned, seeking a design gestalt (i.e., the ability to approach problems creatively and individually while maintaining unity across outcomes) through design intent, environmental constraints and capabilities, and purpose (Yoo, Boland Jr, & Lyytinen, 2006). Galbraith informs that redesign, or organization reconfiguration is important to ensure alignment. Reconfiguration can yield organizational improvements, opportunity, learning, and respond favorably to change and unpredictability (Galbraith et al., 2002). Redesign can be triggered with a new division, growth, a change in strategy, leadership, external environment, or to improve performance.

Collaborative Discourse

Human beings acquire, maintain and use internal models to understand and manipulate complex systems or situations. The presence of such ‘mental models’ were first hypothesized by Charles Sanders Peirce (1896) when he postulated that reasoning “examines the state of things asserted in the premises, forms a diagram of that state of things, perceives in the parts of the diagrams relations not explicitly mentioned in the premises, satisfies itself by mental experiments upon the diagram that these relations would always subsist, or at least would do so in a certain proportion of cases, and concludes their necessary, or probable, truth” (Hartshorne, Weiss, & Burks, 1967). However, Scottish psychologist Kenneth Craik (1943) popularized the concept when he postulated that the mind creates a ‘small-scale model’ of reality that allows it to visualize possible events and various alternatives. Simply put, mental models are internal representations of the external world that enable us to make meaning of complex situations.

Collaboration from a Design Perspective

The literature suggests that several factors, including power, leadership, and experience can affect collaboration outcomes. The well-established role of each of these factors in collaboration and the potential impact of design thinking on them are discussed below.

Power. Power is a recurring theme “causing anxiety or reward in collaboration” (Vangen & Huxham, 2003b, p.: 7). A common characteristic of collaboration is power imbalance (Ansell & Gash,

2008; Berger et al., 2004) which can result in misuse of leverage, imposed strategy or style, patronization, or dominance leading to mistrust (Ansell & Gash, 2008; Berger et al., 2004). Power imbalance is especially problematic with partners that lack organizational infrastructure (Ansell & Gash, 2008), i.e., planned processes and systems, the skills and expertise to engage in technical discussions (Lasker, Weiss, & Miller, 2001; Warner, 2006), or the time, energy, and/or freedom to be engaged (Yaffee & Wondolleck, 2003). The dominance of well-intentioned more powerful partners does not always yield the best outcomes because underestimating the power of the weaker partner (Berger et al., 2004) or underrepresented groups (Ansell & Gash, 2008), can result in collaboration inertia.

Design thinking reframes this power dynamic. Design thinking firms continuously redesign their business for innovation and efficiency (Martin 2009). For breakthrough innovations, different attitudes and skills are needed (Verganti, 2008). Instead of a focus on power imbalance, design thinking suggests that the team-based approach to innovation unlocks its creative power because “all of us are smarter than any of us” (Brown, 2009, p.: 26). In the design paradigm the solutions to complex problems is in the creative work of the team (Brown, 2009), a different approach from analytical thinking. As Brown (2009, pp.: 67, quoting Nobel Prize winner Linus Pauling) observes, “To have a good idea, you must first have lots of ideas” or expressed by Pisano and Verganti (2008, p.: 3) “interesting innovative solutions can come from people or organizations you might never have imagined had something to contribute.” Design thinking suggests that co-creation replace hierarchy “affording all stakeholders the possibility to influence and bring forth meaningful and relevant solutions in a collaborative environment” (Kirah, 2009, p.: 3).

Despite different views about the nature of power in collaborative relationships (Coston, 1998), partnerships require actors from each sector to adopt characteristics and points of view that once defined, can stabilize the identities of their counterparts (Linder, 1999). In developing innovative processes, this notion has been called perspective making (“the ability to make strong perspectives within a community”) and perspective taking (“the ability to take the perspective of another into account”) (Boland Jr & Tenkasi, 1995, p.: 350). Power between partners need not be equal (Selsky & Parker, 2005), however partners should recognize the influence of the other. This idea is advanced through research that examines the NGO as enablers (or stakegivers) and obstructors (or staketakers) in collaborations (Teegen & Doh, 2003).

This idea is distinguished and advanced in design thinking. Although it takes place in groups, design thinking is not group thinking – design thinking liberates creativity (Brown, 2009) and emphasizes fundamental human needs through a human-centered approach (Brown, 2008) which is different from a user-centered approach. The development of a human centered approach focuses on

the creation of meaning. With the introduction of design thinking, the private sector has advanced the two traditional strategies for innovation: “quantum leaps in product performance enabled by breakthrough technologies, and improved product solutions enabled by better analysis of users’ needs” creating a third strategy – design-driven innovation, a different and unexpected, unsolicited, radical innovation of meaning (Verganti, 2008, p.: 4). Human centered design involves power shifts (Greenbaum, 1993). Three aspects of power that affect collaboration are formal authority (a recognized and legitimate right to make a decision), the control of critical resources (i.e., information, expertise, dollars, equipment), and discursive legitimacy (speak legitimately for issues) (Hardy & Phillips, 1998, p.: 219). Power, thus, may be unilaterally situated (by government mandate, for example) (Mattessich, Murray-Close, & Monsey, 2001), accrued to those with financial resources or correlated with assets brought to the collaboration (Berger et al., 2004; Huxham, 2003) or discursively claimed (Hardy & Phillips, 1998). It is often anticipated that the private sector partner will be more powerful, but this is not always the case (Berger et al., 2004). Human centered design “will capture unexpected insights and produce innovation that more precisely reflects what consumers want” (Brown, 2008, p.: 8). The movement from user-centered design to the participatory experience of human centered design is evolving to design “with” people instead of “for” people (Kirah, 2009; Smith, 2009). Verganti (2008) defines this process as contingent upon “interpreters,” a wide range of noncompeting actors that investigate and influence future meaning by listening, interpreting and addressing the design conversation. This approach suggests that the power infrastructure may provide a better lens for understanding power than the three aspects discussed above.

Power infrastructure consists of points of influence that identify how power is actually enacted e.g., who names the collaboration, who is invited to join it, who arranges the meetings (Huxham, 2003), who has better relationships with various stakeholders (Berger et al., 2004), who defines the problem to be solved, etc. Huxham suggests that many points of power make up the power infrastructure and relate to communication and processes. Moreover, power infrastructure is dynamic with continuous shifting of power points (Huxham, 2003). The purpose of understanding the power infrastructure is to determine if partners are consciously or unintentionally exerting power (Huxham, 2003).

Leadership. A key component of managing as designing is leadership because leaders and designers are meaning makers (Bevan et al., 2007). With design thinking or a design attitude, leaders are encouraged to move beyond responding to alternatives presented to engage in a decision-making process that involves collecting and interpreting evidence, designing possibilities, and testing multiple ideas (Boland Jr et al., 2008).

Leaders, the collaboration literature suggests, contribute to collaboration success by engaging partners (Armistead et al., 2007), bridging the differences in organizational cultures (Berger et al., 2004; Huxham, 1996), and guiding partners through the “rough patches of the collaboration process” (Ansell & Gash, 2008, p.: 554). Leaders that embrace, empower, involve, and mobilize members (Vangen & Huxham, 2003a) and observe, will promote effective collaboration outcomes. According to Lasker and Weiss (2001) the skills required to lead partnerships are different than those of traditional leaders:

“Traditional leaders frequently have a narrow range of expertise, speak a language that can be understood only by their peers, are used to being in control, and relate to the people with whom they work as followers or subordinates rather than partners. Partnerships, by contrast, need boundary-spanning leaders who understand and appreciate partners’ different perspectives, can bridge their diverse cultures, and are comfortable sharing ideas, resources, and power.” (Lasker et al., 2001, p.: 193)

This suggests that the design of effective collaborations may owe, in part, to particular mindsets, skills and perspectives of their leaders. At its best, design thinking by a leader facilitates the collaborative process “...where all members of the organization are given the opportunity to create meaningful and relevant changes” within it (Kirah, 2009, p.: 4). Design minded leaders, she says, empower others to become agents of change. An inquiry about how and to what extent leaders influence the actual design and redesign of cross sector collaborations must necessarily, therefore, appreciate the facilitative function of leadership described by Lasker and Weiss. A leader with a “design mindset” has been described as having “...the ability to think holistically and to abstract meaning and value in multidisciplinary collaboration (Kirah, 2009, p.: 2). Not all leaders, however, are “design minded.” Gould and Campbell (2002, p.: 117) contend that “organizational structures evolve in fits and starts, shaped more by politics than by policies.” When an organizational design isn’t working well, leaders may sense it, the authors say, but “few take meaningful action” despite the fact that “design flaws can turn into disasters.” Worse, some leaders actually manipulate agendas and politick – performing what Huxam 2003) calls “collaboration thuggery.”

Experience. Partner experience can be critical, because partners can be mismatched with respect to mission, structure, goals, organizational culture, decision-making style, motives, desired constituents to serve and in cases of severe difference collaborative advantage is difficult to achieve (Berger et al., 2004; Huxham, 2003). If mutual gains are to be achieved, there needs to be some alignment among the partners because mismatched partners can also strain collaboration (Berger et al., 2004). Additional strains on collaboration that experienced partners avoid are lack of renewal necessary for continued commitment (Le Ber & Branzei, 2009), the engagement of new people in

preparation for personnel turnover (Berger et al., 2004), and conflict that emerges from different aims, expectations, strategies, and outcomes (Bryson et al., 2006).

Partners can pre-empt problems of fit and structure to avoid misallocation of costs/benefits, mismatched partners (Berger et al., 2004) and to foster renewal (Le Ber & Branzei, 2009). A classic example of misallocation of costs/benefits is the NGO contribution being undervalued by the private sector partner (often the result of not knowing how to measure it) (Berger et al., 2004). Another is belief by the NGO that the collaboration is not viewed as a priority by the for-profit partner (Berger et al., 2004). History of cooperation or conflict among partners also enables or constrains collaboration (Ansell & Gash, 2008; Gray, 1989). While high conflict is not a collaboration barrier, a history of conflict creates low trust levels that foster manipulation and deter communication (Ansell & Gash, 2008).

Design thinking suggests that experience assists with the reconciliation of analytical thinking “to declare truths and certainties about the world” and intuitive thinking “the art of knowing without reasoning” (Martin, 2009, pp.: 5-6). For example, “conventional business thinking said that a company could have innovation or it could have efficiency, but not both at once. There was, according to the received wisdom, always a trade-off” but design thinking makes both possible (Martin, 2009, p.: 82). Experience creates better design thinkers because a particular phenomenon may have been seen before, experienced partners “don’t have to interpret every sensation or input from scratch as a novice would” (Martin, 2009, p.: 165).

EXPLORING POWER ASSYMETRY IN CUSTOMER RELATIONSHIPS IN THE SPECIFIC CONTEXT OF HIGHER EDUCATION

Wieczorek, Anna¹; Mitreęa, Maciej²

¹Institute of Modern Languages, University of Bielsko-Biala, Bielsko-Biala, Poland

²Department of Organizational Relationship Management, University of Economics in Katowice, Katowice, Poland

ABSTRACT

Power, its various forms and power-related tactics have long tradition in academic research on relationship between business partners. This study aims at exploring to what extent power asymmetry treated as a multi-dimensional phenomenon, i.e. with regard to various power sources is a meaningful concept in describing relationships between current universities and their strategic customers. Case study approach applied in this research enabled getting qualitative insights with regard to postgraduate studies program organized at a middle size university in Poland. The research results suggest that power asymmetry in strategic customer relationships is blurred and dynamic, which creates managerial and teaching challenges. There are some opportunities to manage these asymmetrical relationships especially with regard to value co-creation.

Keywords: Power, Asymmetry, Strategic customers, universities

1. INTRODUCTION

Power asymmetry is commonly treated as an inherent feature in relationships between sellers and buyers within an industrial setting (Siemieniako and Mitreęa, 2018), this study, however, aims at exploring the practices of a university understood as a supplier, oriented towards balancing power within asymmetrical relationships with its strategic customers who are post-graduate students. In order to propose this concept of power asymmetry in the new, still underdeveloped field of higher education, where the university is treated as a supplier and postgraduate students perceived as buyers, the general phenomenon of power asymmetry needs to be defined and discussed at first.

2. POWER ASYMMETRY –LITERATURE REVIEW

Power has been a crucial concept in the research on business relationships for a long time. Power itself, according to Emerson (1962), derives from the dependence of certain parties on each other. Cowan, et al., (2015), stress that power within a social exchange can be understood as a potential of affecting other people's behaviour, that is manifested when a company demands something that is

incompatible with another company's desire. Such situation is likely to result in the resistance of the company receiving the demand. In relationships characterised by asymmetry, one party is recognized as being more influential and able to exercise control over the other one (Siemieniako and Mitreęa, 2018). The research on power asymmetry has been ongoing for a long time, since already in the late sixties of the previous century, French and Raven (1959), identified five different power bases, which are reward, coercive, legitimate, referent and expert power. Afterwards, many researchers used those foundations to categorize the sources of power which finally were categorized into coercive and other power sources among which expert, referent, legitimate and reward power were classified as non-coercive ones (i.e. Cowan et al., 2015; Frazier and Summers, 1984; Handley and Benton, 2012). Power asymmetry can be understood as a lack of symmetry between two companies cooperating together, or, and this is the way the authors of the paper understand it, between a business entity and a strategic customer. Other authors in the field (e.g. Benton and Maloni, 2005; Nyaga, Lynch, Marshall, and Ambrose, 2013) divide power sources into mediated and non-mediated ones, where the former refer to legitimate, coercive and reward and the latter to expert, referent, informational power. Coercive power refers to a situation where one company can punish the other, for instance by enforcing something. The study by Siemieniako and Mitreęa (2018) provided examples of using such coercive power sources as: imposing financial penalties, withholding important support or reward, or threatening to withdraw an initial promise. The mediated power sources are complemented by non-mediated power sources which encompass especially referent power, expert and informational power. Although power is a key concept in research on business relationships, a different understanding of this notion by industrial marketing researchers resulted in inconsistent empirical findings (Hingley, 2005a, 2005b).

Generally, utilizing non-mediated power, such as referent and expert power, is believed to be a more effective strategy in a long-term business relationship rather than using coercive power (Benton and Maloni, 2005; Cowan et al., 2015; Hausman and Johnston, 2010). When one party in the relationship has expert power, this means, according to Siemieniako and Mitreęa (2018) that they possess expertise and knowledge that the other party lacks and wants. Cooperating with a more competent partner usually increases the value of the relationship and makes the relationship more important for the less competent party (Palmatier, Dant, Grewal, and Evans, 2006). Another source of power – the informational power is a specific variation of expert power, because, according to Maloni and Benton (2000:9) "expert power refers to the perception that one firm holds information or expertise (such as product or process leadership) that is valued by another firm". The third source of power – referent power, can be observed and manifests itself, in view of Nyaga, Lynch, Marshall, and Ambrose (2013) in a situation when one firm admires the way another conducts its operations and therefore values

being identified with it. The referent and expert power is positively correlated with a good relationship atmosphere and many vital relationship features such as trust and commitment (Crook & Combs, 2007; Zhao, Huo, Flynn, and Yeung, 2008).

2.1 Power asymmetry and business processes

When it comes to the power asymmetry and its influence on the business processes, many authors in the field (e.g. Cowan et al., 2015; Munksgaard and Medlin, 2014; Pfeffer and Salancik, 1978; Wolfe and McGinn, 2005), stress such negative effects of power asymmetry in business relationships, as unequal distribution of benefits, predominating the more powerful party, neglecting the interests of the low-power party by the high-power party (Wolfe & McGinn, 2005), whereas the others (e.g. Cuevas, Julkunen, and Gabrielsson, 2015; Pérez and Cambra-Fierro, 2015; Wang, 2011) perceive power asymmetry as a natural aspect of business relationships. Siemieniako and Mitreġa (2018) claim that, if managed wisely, power asymmetry enables control over relationship development and may be beneficial to both sides: the dominating party and the dominated one. Although there is no consensus between authors when it comes to the positive vs. negative outcomes of power asymmetry, they ubiquitously indicate that exchange partners should avoid using power in coercive ways, if they count on long term relationship benefits (Benton and Maloni, 2005; Cox, 2001).

The issue of symmetrical or asymmetrical power is neither precisely explained in the literature or used in such manner in business practice, because there is not, and probably cannot be, a clear measure of power within the business relationship. All of this is because power in buyer-seller relationships is multi-dimensional, perspective-based and dynamic phenomenon. In the plain of business and business relationships it very rarely happens that two cooperating companies manifest the same competencies and have/offer the same resources. From the business point of view it would even be a negative situation since one business entity would have nothing special to offer the other. Siemieniako and Mitreġa (2018) stress, that differences between such partners enable synergic effects in such areas like, for instance, joint product development, or supply chain integration and power asymmetry is, probably, inevitable element of every relationship between selling and buying companies. Nevertheless, business player should analyse the risk connected with substantial power asymmetry and anticipating some negative effects by managing its position in a non-coercive way. In general, the power balance between two business partners may be acknowledged subjectively by each or one of the parties as too asymmetrical or with reasonable level of asymmetry with regard to the mix of all power sources, i.e. mediated and non-mediated power types.

3. POWER ASYMMETRY BETWEEN UNIVERSITY AND ITS STRATEGIC CUSTOMERS – CONCEPTUALISATION

As mentioned earlier, power asymmetry may be witnessed within industrial settings as an inherent feature of seller - buyers relationships and it has been researched for a rather long time. It appears to be an underdeveloped research direction in general and it is also interesting if such power asymmetry is meaningful in the specific context of relationships between university and its key customers. University sells its knowledge and expertise and therefore is a seller, whereas students can be perceived as clients. Taking into consideration rapid changes witnessed by contemporary academia (demographic crisis in EU, changes in the financial system resulting in stronger emphasis on scholars' finding financing outside university, e.g. grants, internships, etc., higher expectations towards scholars in relation to productivity), universities now compete for customers and take great care for extra income sources. By extra sources we do not mean here money provided by the government for educating regular students, but money that customers bring directly to university, for instance paying for extramural studies.

Specifically, we call postgraduate students strategic or key customers at universities for the reason that they bring direct income and they significantly differ from regular students when it comes to their expectations and background knowledge. Post graduate students first of all have different motivations of studying – as older and already involved professionally people, they know which knowledge they need to absorb to become better employees and boost career and therefore they have clear expectations towards the lecturers and the learning-teaching process. Thus, they are relatively highly motivated. What is more, they tend to have much wider background knowledge of the subject matter since they very often are specialists in the field they want to explore; this means they are really involved in classes which is treated by lecturers as an advantage, but at the same time, some of them may manifest wider practical knowledge than the academic teacher, which may be perceived by this teacher as something difficult to cope with. For the above reasons, it seems quite clear here that power asymmetry between a university and its strategic customers significantly differs in its dynamics from typical buyer-seller asymmetry within industrial settings. It seems the division between the dominating force and the dominated one will sometimes be not so clear and blurred and therefore it seems a very interesting area to explore. The topic may be also seen as very up-to-date especially in view of the fact that nowadays universities need to be more and more entrepreneurial to survive in the highly competitive environment and customer management capabilities become very important in their business.

4. RESEARCH APPROACH AND RESEARCH RESULTS

We applied a longitudinal case study approach to explore and understand specific interrelations between sellers' tactics, their power position in relation to key customers, and the relationship benefits acquired by two parties. The case study method was often used in prior studies of power asymmetry in business relationships (e.g. Cox, Watson, Lonsdale, and Sanderson, 2004; Pérez & Cambra-Fierro, 2015). Our study focuses on the evolution of a dyadic relationship between an organization and their key customers. The case study method allowed us to analyse the evolution of non-mediated power asymmetry over a period of time, as well as the mutual relationship benefits that the seller and buyer acquire over the same period of time. The relationship between the selling organization, which is a medium size public university in Poland (called University X thereafter) and the buyers, who are X's graduate students, has been studied for 8 years. In order to understand our approach, study objectives, method and the profile of informants need to be briefly discussed.

4.1 Study objectives

Main study objective was to explore in what way the concept of power asymmetry may be applicable in educational settings – between a university and its strategic clients. Detached objectives concerned discussion on mediated and non-mediated power sources in the context of educational settings between university and post graduate students and identification of domination sources of each party and their manifestations. Last, but not least, we tried to look for benefits and threats of the identified power sources and we tried to analyse if some power sources and areas of domination are blurred between the two parties.

4.2 Profile of informants

The research informants were students studying at "Y" post graduate studies in the teaching area of sales management. These postgraduate studies existed on education market for over ten years and was very competitive in comparison to other study offers at the university investigated. Students were in majority of cases sales managers from various business sectors and sales representatives aspiring for a promotion. They chose that offer for two reasons mainly: first of all, acquiring diploma with the title nicely tailored to their career, the study name is actually similar to the position most of students for a new knowledge and competencies with relation to sales management area.. They had clear needs and high expectations and at the same time really significant knowledge in the area of sales, communication and sometimes middle-level management as they were experienced employees. This way they were valuable and demanding customers for the university and lecturers especially. At the same time they really wanted to contribute to the learning and teaching process and they took active participation in shaping course program for the next years. They also had substantial impact on attitudes of prospective customers since their recommendations and word-of-mouth marketing

played and still play a significant role in promoting the studies, especially if we consider lack of concrete advertising budget that managers could use for promoting studies among candidates.

4.3 Research method

There were two main information sources that we used in case study. Firstly, we used anonymous student satisfaction questionnaire administered twice per academic year at post graduate studies. The tool was not designed for the purpose of this study specifically, because heads of post graduate studies must administer such questionnaires in order to measure satisfaction of students concerning the services provided and then report the results to university authorities. We however realised, as heads of post-graduate studies, that such questionnaires are an excellent source of information much beyond the quality of teaching-learning process and for that reason they were used for the purpose of exploring power asymmetry within university settings as well. The student questionnaire aimed at measuring student satisfaction and extensive feedback with regard to various aspects of teaching/learning twice per academic year. This means that each group of students (each edition of studies) filled it in twice. In the questionnaire there were close-ended questions designed in the form of Likert scale which measured the performance of teachers in the following categories: expert knowledge, the proportion between theoretical and practical elements in each subject, the quality and usefulness of materials administered for students, the quality of teaching style of each teacher, teachers' attitudes towards students. There were also open-ended questions that were more important for the purpose of our case study approach and there students were asked which elements of the offer they were most satisfied and dissatisfied with and why and who their favourite and most disliked teachers were and why. They were also welcomed to give any suggestions concerning study concept, offer and programme and many of them provided such information. Each year the heads of studies categorised and analysed the results and wrote down some conclusions concerning the study.

Secondly, each year few students were also asked to participate in personal unstructured interviews which concerned various aspects of teaching and learning, including problematic situations experienced by them with lecturers, students contribution to the learning process and interactions between students themselves. In total, during 8 years we collected information from 17 different students this. Additionally, we used participatory observation technique, which took form of making some notes after spotting interactions with students during classes which appeared to be relevant for our research.

In this paper we try to analyse mostly qualitative data we gathered over investigated time and try to interpret them in the context of power (a)symmetry in relationships between the university and lecturers are treated as the selling side and students as buyers. We also endeavour to explore if the

distinctions between sellers and buyers and their power are blurred, what type of asymmetry can be witnessed and how each side may be treated as a source of power and what type of power can be witnessed.

The empirical material, contained quantitative elements (Likert scale - based information concerning performance of all academic teachers, usefulness of materials, teachers' attitudes towards students) and qualitative elements (open-ended questions referring to advantages and disadvantages of the study programme, preferences with regard to the best and the worst academic teacher each year, etc.). In this case study we were mostly interested in the qualitative data and sometimes used quantitative information just to validate the qualitative results (e.g. checking if an academic teacher described in open-ended questions as the best one scored high on Likert scale as one having great expertise, manifesting positive attitudes towards students, incorporating a good proportion of theory and practice into classes). To large extent (with regard to results of personal individual interviews), the qualitative data was double coded to avoid coder's bias (Krippendorff, 2004) and then it was analysed in accordance with QDA (Qualitative data Analysis, Seidel, 1998) principles and especially the process of noticing, collecting and thinking. On the basis of the emerged theory, study questions were answered and they are going to be elaborated on in the next section of the paper.

4.5 Research results and Research discussion

The qualitative data that emerged as a result of applying QDA principles to data analysis, revealed results that may potentially contribute to the still underdeveloped area of power asymmetry in exchanges between buyers and sellers, especially in the very specific context of university sector. Our results show areas of power dominance, areas of blurred power dominance between the two parties and opportunities and threats of the identified multi-layer power dominance. The results have been grouped and they are presented below.

4.5.1 Implementing the general concept of power asymmetry in university – strategic customers setting.

Power asymmetry is commonly understood as a lack of symmetry between two companies cooperating together and in relationships characterised by asymmetry, one party is recognized as being more influential and able to exercise control over the other one (Siemieniako and Mitreęa, 2018). The above definition can be applied to the discussed context with one change only – the buyer is not a business entity, but a strategic customer which implies that this is an individual affiliated to some business (i.e. employee), sometimes very large company. The lack of symmetry can be clearly visible, but in the context of university-strategic customer relationships the dominance is not a stable thing, but it shifts from one party to the other, depending on circumstances and type of asymmetry manifested. The strategic customers investigated were aware of the lack of symmetry and they were

inclined to think that most often the university was the dominant party, but interviews conducted with students were able to give some examples of client dominance. The informants claimed that the post graduate studies created the context of stronger power position of students as compared to regular students. Post graduate students in general bring direct income to the university, have richer background field knowledge than the regular ones and, as a result, have higher expectations towards academic teachers and the teaching-learning process. On the other hand, due to their expertise, they may co-create some values with the teachers that are significant to the development of both parties. For all those reasons they are strategic customers for the university. The informants were inclined to think that in general in their relationship with university, the university is a dominant party, but they perceived power asymmetry as a natural aspect of such relationship and this is compatible with views of many authors in the field (e.g. Cuevas, Julkunen, and Gabriellsson, 2015; Pérez and Cambra-Fierro, 2015; Wang, 2011) that advocate the view that such asymmetry is part of every business relationship.

4.5.2 Mediated and non-mediated power sources in the educational setting.

While speaking about power asymmetry, we may consider mediated and non-mediated power sources in university setting. Mediated power sources comprise coercive, legitimate and reward power. As far as mediated power sources are concerned, coercive power, understood as the ability of imposing financial penalties, withholding important support or reward, or threatening to withdraw an initial promise, was according to the informants an example of university dominance (after Molm, 1997; and Yeung, Selen, Zhang, and Huo, 2009). The academic teachers mark post-graduate students and this way they may exert mediated power on them in terms of both coercive and reward power (French & Raven, 1959). There are also some elements of interactions that are matter of negotiation between university and students, e.g. potential to organize some classes in distant location combined with student integration, and university, specifically managers of the Y studies, may use this element as referent power, i.e. to make students participate in some value co-creation, e.g. providing information for teaching case studies based on real business events. Legitimate power is related to contractual agreements, which may be utilized to influence partner behaviour. In case of such power, all informants ubiquitously manifested a conviction that a university is a source of dominance since they can impose penalties for not obeying the rules described in contractual agreements, like for instance the necessity to pay the tuition fees even if they are not pleased with the process of teaching.

On the other hand, students tend to use the reward power (French & Raven, 1959) to encourage the teachers to assign higher marks to them (i.e. few informants mentioned that they offered to prepare a letter of recommendation before the final examination because they thought it could help them achieve better final results). They may also use other aspects of reward power, e.g. suggesting they

may engage in more co-creation activities in exchange for receiving extra friendly atmosphere during classes or especially during special classes organized in distant location. It appears quite clear that in case of mediated power sources, the university is the dominant party in majority of contexts, although there are blurred areas of dominance like, for instance, coercive power that can be manifested by two parties.

Non-mediated power sources comprise expert, referent and informational power. When it comes to expert power, Palmatier, Dant, Grewal, and Evans (2006), define it as an expert power which one party in the relationship has and which refers to expertise and knowledge that the other party wants. Informational power is, according to Maloni and Benton (2000) a part of expert power and for that reason they will be treated as one power source – expert power. The informants very often chose those academic teachers as their favourite ones, who had a great amount of expert knowledge in the field. This way it is visible that university is a dominating party in this context as its employers offer expert knowledge to its strategic customers. When it comes to referent power, it is understood (after Nyaga, Lynch, Marshall, and Ambrose, 2013) as a situation when one firm admires the way another one conducts its operations and therefore values being identified with it. After analysing all qualitative data it emerges that referent power is the brightest example of blurred dominance source since in the context of post graduate studies, students very highly evaluated the course, the expertise of teachers and their attitudes towards students, but at the same time they were aware that, thanks to their professional experience and business ties, they were an excellent source of information for the teachers (e.g. they could provide relevant and up-to-date data for teachers' research and teaching case studies as well as they could strongly contribute to the quality of classes at the time while they are conducted). By being very active during classes, e.g. during discussing teaching case studies and providing real life examples to theoretical lecture, some particular students built very strong personal brand towards not only their peers, i.e. other students, but also lecturers themselves, because sometimes lecturers may have a very limited expertise with regard to some specific business techniques or industry-related features. Some students generally tend to be also very influential due to spectacular professional results they report in their current or previous jobs. Thus, they are sometimes treated as living "benchmarks" for some element of teaching programme.

5. CONCLUSIONS

Our research suggests that there is a power asymmetry between university and its strategic customers and we can distinguish between various power sources (a)symmetry although in many cases power structure between parties is blurred. We feel that it should not be treated as something negative because the fact that the areas of dominance are blurred, indicates that there is a mutual influence

between university and its strategic customers and this may lead to strong value co-creation (Prahalad and Ramaswamy 2000; Vargo and Lusch 2004). It opens the future research about mechanism standing behind value co-creation in university setting and such research direction could be very interesting, because the collaboration between companies and their customers aimed at providing various resources to increase value being offered and consumed has become one of most popular topics in marketing science, especially in the last decade (Alves et al. 2016). The co-created value translates into more competitive university offer. For this reason neither scholar nor university authorities should focus only on threats of power asymmetry dynamics in this context, but rather opportunities that such dominance shifts create. It also appears worth investigating how power asymmetry creates opportunities not only for the dominant party, but for the dominated one as well. When it comes to study limitations, these are universal limitations of qualitative studies – the results have not been validated through other informants, especially not through quantitative research with rigorous sample selection. On the other hand, the scope of this qualitative research was not about “how many” or “how strong” power asymmetry influences on university-students relations, but rather we wanted to explore “whether” and “how” it happens in this specific research setting. We were mainly interested if power asymmetry concept can be applicable to buyer-seller relationships within educational settings and how power and dominance are manifested and shifted in such settings. Thus, although our research is not conclusive with regard to many aspects, i.e. how power asymmetry could be managed by university authorities, it illustrates that power asymmetry is dynamic phenomenon in this context and it creates some business opportunities at the level of the whole university and at the level of particular lecturers as well.

ACKNOWLEDGEMENTS

ABSTRACT

The rapid development of Web 2.0 has offered scholars numerous emerging research methods, specifically in the marketing area. Accordingly, their interest in understanding these methods has increased. Recently, scholars have noticed the potential of netnography – an under-applied, computer-mediated, qualitative research method – but they have been reluctant to use it as a research approach during their studies as there are numerous misconceptions about netnography and its procedures. This paper, therefore, provides insights on procedures required to successfully utilise netnography, to scholars, who are willing to use netnography for the first time as a research tool. Essentially, the study discusses in details its processes by explaining the steps of conducting netnography on one of the most famous fashion online communities. The paper applies netnography to a single fashion online community in Facebook, which is active for three years and gathers a large number of fashion enthusiasts from Southeast Europe. The researcher used an active stance when conducting the method and collected data during a three-month period. The paper presents the experience of new researchers around netnography. It contributes methodologically by providing further insights to researchers by explaining the basic steps required to successfully utilise netnography, and to create and effectively deal with the organisation around its implementation. Most importantly, it shows that netnography offers scholars the opportunity to deeply understand consumers' interactions and consumer perceptions.

Keywords: Netnography, Netnography Scholar Guidelines, Qualitative Method, Fashion Online Community

INTRODUCTION

There is an increasing interest in innovation in social research methods, specifically among academics in the marketing field. The advent of Web 2.0 has created the opportunity to develop several new research methods, mostly new computer-mediated approaches, like: online focus groups, online interviews, or image analysis (Mahajan, 2015). A novel approach, which assists to successfully collect insights about consumer behavior on the Internet and has gained the attention of scholars is netnography, which has been firstly suggested by Kozinets (2002).

Netnography offers an understanding of consumer practices within online communities (e.g. de Valck *et al.*, 2009; Quinton and Wilson, 2016). As a research method, netnography has already been applied in a few researches and thus, it has established certain research procedures. Kozinets was the first scholar to suggest them. They offer useful guidelines to researchers, who intend to use such method (Chua and Banerjee, 2013; Quinton and Wilson, 2016). Several of them adopted the guidelines suggested by Kozinets (2002); on the other hand, a few others (Bratucu *et al.*, 2014) suggested further changes to the procedure. Despite scholars having different views on possible procedures, netnography has been adopted in certain sectors and has shown good results (Wiles *et al.*, 2013; Costello *et al.*, 2017).

Nevertheless, scholars are still reluctant to employ netnography in their studies. Past studies, such as Xun and Reynolds (2010), Prior and Miller (2012) and Kulavuz-Onal (2015), have provided insights into the principles of netnographic studies. They have described the procedure of applying netnography and have focused on the results of the analysis. However, there are numerous misconceptions about netnography and its procedures, which need to be further addressed by future studies. Consequently, Tunçalp and Le (2014) recognised the necessity to discuss and report thoroughly the procedures of netnography. The following research, therefore, intends to explain this approach by paying particular attention to the scope of its procedures, the data collection process and the techniques used to analyse them.

OBJECTIVES OF THE STUDY

At large, the following research aims to address the following research questions:

R1: What is the experience of the new researchers when employing netnography in their studies?

R2: What are the opportunities that netnography can offer to new scholars?

It is through these research questions that it aims to achieve its overall goal – to provide insights to new scholars in the field, who are willing to apply netnography, by demonstrating the effectiveness and benefits of using netnography as a research tool. In particular, it intends to:

- 1) identify the main literature on netnography

- 2) explain the procedures of netnography
- 3) demonstrate the process of conducting netnography for new scholars
- 4) explain the benefits of using netnography as a research tool to new scholars

Taking these into account, the paper first shows the relevant literature about netnography's concept and procedures. Secondly, it offers a description of the methodology and methods used. This is followed by the data analysis and findings section, which explains the process of applying netnography in details, and lastly, the research offers concluding remarks about netnography as a research method among new scholars.

RELEVANT LITERATURE

The concept of Netnography

Netnography was first developed in the late 1990s in the United States (Costello *et al.*, 2017). The term netnography was coined by Kozinets (1999), and it is a portmanteau of Internet and ethnography (Kozinets, 2012; Dahl, 2015). Netnography is also known by a range of other designations, such as "cyber ethnography", "virtual ethnography" (Hine, 2000) (which, in 2015, was re-articulated by Hine as "ethnography for Internet"), "online ethnography" (Markham, 2005), "connective ethnography" (Dirksen *et al.*, 2010), and "web-ethnography" (Prior and Miller, 2012). Besides having different names, these approaches differ in their methodological frameworks as well. Unlike netnography, which is conducted entirely online, online ethnography and virtual ethnography accept an amalgamation of online and offline ethnography in order to examine the online phenomena (Kulavuz-Onal, 2015). Yet, a number of scholars use these terms interchangeably (Kulavuz-Onal, 2015). According to Costello *et al.*, (2017), these confusions are the result of the wide-ranging scope and approaches used by these methods.

Kozinets is considered to be the first advocate of netnography. In his view, netnography is: "a new qualitative research method that adapts ethnographic research techniques to the study of cultures and communities emerging through electronic networks (Kozinets, 2002, p. 62)". Besides Kozinets, Hine has made significant contributions to the literature on this subject (Long *et al.*, 2015) (refer to **Table 1** to see the key researchers through the years). She views netnography as an adaption of ethnography to the Internet (Hine, 2000). Her landmark book "Virtual Ethnography" (2000) and her latest book "Ethnography for Internet" (2015) has, over the years, encouraged critical debate on the subject in question. Postill and Pink (2012) refer to Hine's work as a response to the crisis ethnography was going through in the 20th century. Numerous scholars, including Xun and Reynolds (2010) and Kulavuz-Onal (2015), agreed with Hine's view that netnography is 'the adaptive ethnography'. Additionally, Chua and Banerjee (2013) referred to netnography as the online evolution of

ethnography, Chan and Li (2010) described netnography as “a qualitative method that adapts ethnography to the Internet environment using publicly available information... (p.1036)”, and Prior and Miller (2012) referred to it as “the application of ethnographic methods to an online context (p. 507)”. Whereas, Driscoll and Gregg (2010), went even further, arguing that netnography is “ethnography which attempts to mimic (attempts to be as good as) ethnographic fieldwork (p. 17)”

Table 1: Key Researchers in Netnography through the Years (Wiles et al., 2013)

Kozinets (1999, 2002) himself, recognised the presence of anthropological ethnography elements in netnography. He argued that without ethnography, netnography would only be a ‘coding exercise’ (Kozinets, 2012). However, he did not undermine the distinctiveness of netnography – at large, he considered the approach to be authentic. Similarly, Markham (2005) considered this approach to be groundbreaking because it focuses on online communities, which differ significantly from traditional communities. The authors, similar to Kozinets (2012) and Markham (2005), consider netnography to be a distinct research method. The debate on whether netnography is a new method or an adaptation of ethnography to the Internet has not been concluded yet.

The resemblance between netnography and ethnography

As far as the resemblance between netnography and ethnography is reckoned, researchers have taken two stances: one looking at the resemblances between the two and the other looking at the differences. According to Kozinets (2012), Prior and Miller (2012) and Dahl (2015), traditional ethnography is similar to netnography on the subjects of immersiveness, and adaptability. Both methods are naturalistic, so the researcher gains insight into the actual behaviour and perspectives of consumers within a particular community (Kozinets 2012; Wu and Pearce, 2014). In both methods, the researcher takes an active role; they participate in the study, as well as offer an objective observation. Similar to

ethnography, netnography is adaptable to all cultures and communities (Wu and Pearce, 2014; Dahl, 2015). Additionally, they both offer researchers access to “emic voices (Wu and Pearce, 2014, p. 464)”. Even though several researchers came to an agreement regarding the resemblance between traditional ethnography and netnography (see Kozinets, 2012; Prior and Miller, 2012; Dahl, 2015), many others claim that the ethnographic study of virtual communities goes beyond traditional ethnography. Netnography, when compared to traditional ethnography, is less time consuming, less costly, easier to conduct, and is performed completely online (De Valck *et al.*, 2009; Dahl, 2015). Kozinets (2002) distinguished a few differences between the two methods. According to him, the nature of netnography differs from that of ethnography, as netnography studies the interactions of consumers that are carried through a technological medium. Authenticity of consumers is not known, they can interact using a false and anonymous identity (Xun and Reynolds, 2010). That, however, is not the case in ethnography, because it is conducted in person, and this does not factor (Kozinets, 2012). However, anonymity offers members of online groups more privacy, which encourages them to share their experiences, especially about sensitive topics (Wu and Pearce, 2014; Costello *et al.*, 2017). The next difference is that netnography offers researchers greater accessibility to a broader range of respondents (Xun and Reynolds, 2010; Wu and Pearce, 2014), which has a significant impact on the process of data collection, and it forces a change in the research approach.

Netnography's advantages and disadvantages

Netnography provides marketers with several advantages: it is cost-effective, since the data is freely accessible to anyone and it is unobtrusive, because it occurs in a natural context, and does not influence the community (Xun and Reynolds, 2010; Prior and Miller, 2012; Kulavuz-Onal, 2015; Costello *et al.*, 2017). By making use of it, marketers can access a large amount of data; they can deeply understand consumers' interactions and their views regarding particular brands or products. Therefore, it is considered to be very effective for marketing strategies, especially when developing new products (Healy and McDonagh, 2013). Despite that, netnography is still a relatively new method and as such has a few limitations. According to scholars, the validity and reliability of data gathered using this method is their biggest concern, especially due to the difficulties created by anonymity and questionably authentic behaviour of Internet users (Xun and Reynolds, 2010; Wu and Pearce, 2015).

Netnography's procedures

Netnography has already established procedures for conducting research (Kozinets, 2012). Despite the differences between ethnography and netnography, Kozinets (2002) suggested adopting the common structure approach of ethnography to the processes of netnography. Netnographers' approach is discussed in details below.

Entrée: According to Kozinets (2002), the researcher first needs to form research questions, and based on them, find appropriate online communities. Secondly, the researcher needs to thoroughly learn about the communities they intend to examine (search engines are invaluable at this point). After identifying the most suitable ones, Kozinets (2002) recommends evaluating them using the following criteria:

- 1) A more focused and research question-relevant segment, topic, or group
- 2) Higher “traffic” of posting
- 3) Larger numbers of discrete message posters
- 4) More detailed or descriptively rich data
- 5) More between-member interactions of the type required by the research question

(Kozinets, 2002, p. 63)

After evaluating them, the researcher can select either one or a combination of communities. Once that is done, the research can continue with the next step. The researcher has to bear in mind, however, that the process requires a considerable amount of time (Kozinets, 2002, 2012; Dahl, 2015).

Data Collection and Analysis: The researcher starts this process by selecting firstly, the data taken from the interactions between members of the community, and secondly, the data inscribed from the researcher’s observation. Afterwards, the researcher starts the data gathering process. Considering the great amount of data, Kozinets (2002) recommended to categorise both the data and the community members, in order to simplify the process. The data could be put into two categories: on-topic and off-topic; while community members could be categorised as: tourists, minglers, devotees, or insiders. Once the data collection is done, the analysis begins. The process of analysing data can be completed either by coding, content analysis, data display, or by using software solutions, such as Atlas.ti (Kozinets, 2002; Dahl, 2015).

Providing Trustworthy Interpretation: Even though netnography is a stand-alone method, triangulation of data would offer marketers a more trustworthy interpretation of it. Kozinets (2002) suggested to make use of the following methods in order to triangulate the data: “interviews, focus groups, surveys, or traditional in-person ethnographies (p. 65)”. These methods are important, especially if the researcher intends to generalise the study.

Research Ethics: According to Kozinets (2002), netnography’s use of information may not always be welcomed by the members of the researched community. Thus, if the researcher uses such information without consent, it can negatively impact the ethical value of the research.

Member Checks: The last step requires the researcher to deliver the report or its highlights to the people who were a part of the research. This could be done by publishing it on a Web page, or by sending it via an e-mail (Kozinets, 2002).

A number of researchers followed these steps precisely (see Gurrieri and Cherrier (2013)), while others, like Bratucu *et al.*, (2014) and Prior and Miller (2012) omitted one or more steps. Besides the process, the scope of netnography encouraged much discussion. Even though Kozinets (2002) did not offer any particular suggestions, many scholars shared their views on it. They were concerned with the length of the research and the number of communities involved. Academics, such as: Chua and Banerjee's (2013) preferred to conduct a parallel analysis of several online communities (15 and 4 respectively). In contrast, Ekpo *et al.*, (2015) adopted a more focused approach, by researching the interactions between two communities. Whereas other researchers such as De Valck *et al.*, (2009), Xun and Reynolds (2010), Brodie *et al.*, (2013), and Kulavuz-Onal (2015), limited their study to only one online community. Xun and Reynolds (2010) claimed that the number of communities required, depends on the topic of study and the interested population. If the researcher is interested in a particular topic discussed by a specific population that uses only such a community for that purpose, the researcher should focus on that community, in order to not become overwhelmed by data that they do not need in the first place.

As for the required length of the study, scholars have different views on it. For instance, Brodie *et al.*, (2013) conducted an eighteen-month long study on a community, unlike De Valck *et al.*, (2009) who investigated a single community for three years. Most researchers appear to prefer lengthier studies, because they yield more information than short-term studies (Costello *et al.*, 2017). Nevertheless, some netnographers use shorter studies; Kozinets himself conducted two-to-three months long studies (1999; 2002), which, in most cases, was due to time constraint limitations. Marketers, on the other hand, would have to apply the method the whole time, or in accordance to their marketing goals. Another issue which garnered attention is the participant privacy consideration that "can limit the extent to which the data can be shared (Costello *et al.*, 2017, p. 8)". Netnographers dealt with the issue in different ways. For instance, Ekpo *et al.*, (2015) used 'self-selected usernames' in order to preserve participants' privacy, while Xun and Reynolds (2010) used designations, such as "Participant X".

METHODOLOGY

Research Design

For the purposes of this research, qualitative method is considered the most appropriate one. According to Kapoulas and Mitic (2012), qualitative method is more suitable when the researcher aims to discover a phenomenon or gain a better understanding of new theories and knowledge. Moreover, Andriopoulos and Slater (2013) suggested to employ qualitative methods when the research attempts

to gain insight into the working practices of a new method, and into how they are progressing every day.

Data Collection

The data is gathered through both primary and secondary sources. Primary sources are used in order to gather insights about netnography as a research method. While secondary data, such as academic articles, reports, and studies, are used in order to support and address the identified issues from the primary sources.

Netnography

Netnography is used in order to effectively discover its potential as a marketing research tool. This paper applies netnography to a fashion online community, which has been active for three years and gathers a large number of fashion enthusiasts. The community has been given a coded name – “Trendy” – in order to ensure its privacy throughout the study. After considering the suggestions of Quinton and Wilson (2016), the research took an active stance; hence, the researcher gained permission to use the data the community members provided. A single online community has been analysed and the focus has not only been on text-data, but also on images and videos as Costello *et al.*, (2017) suggested. The data has been collected in a three-month period. The researcher gained permission from the administrators of the community in order to conduct netnography. Additionally, the research considered the participant privacy and hence used designations such as M1, M2, M3.

Sample

The sample method that is used is the non-probability sample, which is common for qualitative research. The sample is chosen in order to best fit the objectives of the study, hence purposive sampling type is used (Noy, 2008). The target population of this research are citizens of Southeastern Europe, who regularly use Internet and participate in fashion online communities.

Data analysis

Data analysis is crucial to credible qualitative research; thus, the researcher carefully chose the method of analysis. The interpretation of the results of this paper is performed through a thematic analysis, as this type of analysis is considered suitable for researchers as it offers them flexibility (Clarke and Braun, 2013). Additionally, thematic analysis offers researchers the ability to create meaningful results (Clarke and Braun, 2016; Saunders *et al.*, 2016).

Data analysis and findings

Netnographic research of the fashion online community

The following section explains in detail the procedure for conducting netnography on the selected fashion online community. The researcher has followed the guidelines suggested by Kozinets (2002);

however, it has taken into consideration suggestions of other researchers as well, such as Quinton and Wilson (2016) and Costello *et al.*, (2017).

1) Entrée: Initially, the main issues that interested the researcher were put into two research questions:

- a) What are opinions of fashion-enthusiasts on the latest trends in fashion?
- b) What are consumer perceptions on garments designed by local fashion designers?

These questions were formed after considering the main fashion designers' potential interest in the topic. The process of locating an appropriate online site to research was based on these questions. This process took a considerable amount of time because all possible sites were searched. Three online communities were identified as appropriate for the research. Each of the community was evaluated through the five criteria suggested by Kozinets (2002), and the one that fit best to the aim of the research was selected.

	Relevant Group	Traffic of Posting	Discrete Message Posters	Rich Data	Interactions Relevant to Research Questions
"Trendy"	1	1	2	1	1
"MV"	1	3	3	3	2
"FW"	3	1	2	2	2
