Abstract

This report describes the physics case, the resulting detector requirements, and the evolving detector concepts for the experimental program at the Electron-Ion Collider (EIC). The EIC will be a powerful new high-luminosity facility in the United States with the capability to collide high-energy electron beams with high-energy proton and ion beams, providing access to those regions in the nucleon and nuclei where their structure is dominated by gluons. Moreover, polarized beams in the EIC will give unprecedented access to the spatial and spin structure of the proton, neutron, and light ions. The studies leading to this document were commissioned and organized by the EIC User Group with the objective of advancing the state and detail of the physics program and developing detector concepts that meet the emerging requirements in preparation for the realization of the EIC. The effort aims to provide the basis for further development of concepts for experimental equipment best suited for the science needs, including the importance of two complementary detectors and interaction regions.

This report consists of three volumes. Volume I is an executive summary of our findings and developed concepts. In Volume II we describe studies of a wide range of physics measurements and the emerging requirements on detector acceptance and performance. Volume III discusses general-purpose detector concepts and the underlying technologies to meet the physics requirements. These considerations will form the basis for a world-class experimental program that aims to increase our understanding of the fundamental structure of all visible matter.

Contents

Title Page	i
Author List	iii
Abstract	ix
Table of Contents	xi
Volume I: Executive Summary	1
1 The Electron-Ion Collider	3
2 Physics Measurements and Requirements	6
2.1 Introduction	6
2.2 Origin of Nucleon Spin	9
2.3 Origin of Nucleon Mass	10
2.4 Multi-Dimensional Imaging of the Nucleon	11
2.5 Imaging the Transverse Spatial Distributions of Partons	12
2.6 Physics with High-Energy Nuclear Beams at the EIC	13
2.7 Nuclear Modifications of Parton Distribution Functions	14
2.8 Passage of Color Charge Through Cold QCD Matter	15
2.9 Connections to Other Fields	17
2.10 Summary of Machine Design Parameters	18

2.11	Summary of Detector Requirements	19
3	Detector Concepts	23
3.1	Tracking and Vertexing Detector Systems	24
3.2	Particle Identification Detector Systems	25
3.3	Calorimeter Detector Systems	26
3.4	Auxiliary Detector Systems	27
3.5	Two Complementary Detectors	28
4	Opportunities for Detector Technology and Computing	30
	Volume II: Physics	35
5	Introduction to Volume II	37
6	The EIC Physics Case	40
7	EIC Measurements and Studies	52
7.1	Global Properties and Parton Structure of Hadrons	52
7.2	Multi-dimensional Imaging of Nucleons, Nuclei, and Mesons	105
7.3	The Nucleus: A Laboratory for QCD	146
7.4	Understanding Hadronization	186
7.5	Connections with Other Fields	214
7.6	Connected Theory Efforts	248
8	Detector Requirements	258
8.1	Inclusive Measurements	260
8.2	Semi-Inclusive Measurements	283
8.3	Jets and Heavy Quarks	294
8.4	Exclusive Measurements	323
8.5	Diffraction Measurements and Tagging	365

8.6	Summary of Requirements	393
Volume III: Detector		397
9	Introduction to Volume III	399
9.1	General EIC Detector Considerations	400
9.2	Reference EIC Detector	402
10	Detector Challenges & Performance Requirements	406
10.1	Beam Energies, Polarization, Versatility, Luminosities	406
10.2	Integrated Detector and Interaction Region	410
10.3	Rate and Multiplicities	413
10.4	Backgrounds	415
10.5	Systematic Uncertainties	427
10.6	Physics Requirements	432
11	Detector Aspects	434
11.1	Magnet	434
11.2	Tracking	436

EIC YELLOW REPORT

Volume I: Executive Summary

Chapter 1

The Electron-Ion Collider

The Electron-Ion Collider (EIC) is a new, innovative, large-scale particle accelerator facility conceived by U.S. nuclear and accelerator physicists over two decades and planned for construction at Brookhaven National Laboratory on Long Island, New York by the U.S. Department of Energy in the 2020s. The EIC will study protons, neutrons and atomic nuclei with the most powerful electron microscope, in terms of versatility, resolving power and intensity, ever built. The resolution and intensity is achieved by colliding high-energy electrons with high-energy protons or (a range of different) ion beams. The EIC provides the capability of colliding beams of polarized electrons with polarized beams of light ions, and this all at high intensity. The EIC was established as the highest priority for new construction in the 2015 US Nuclear Physics Long Range Plan, and was favorably endorsed by a committee established by the National Academy of Sciences in 2018 to assess the science case. In December 2019, the EIC was granted Critical Decision Zero (CD0) by the US Department of Energy, which launched the EIC as an official project of the US government.

The main design requirements of the EIC are:

- Highly polarized electron ($\sim 70\%$) and proton ($\sim 70\%$) beams
- Ion beams from deuterons to heavy nuclei such as gold, lead, or uranium
- Variable $e+p$ center-of-mass energies from 20–100 GeV, upgradable to 140 GeV
- High collision electron-nucleon luminosity $10^{33} - 10^{34} \text{ cm}^{-2} \text{ s}^{-1}$
- Possibility to have more than one interaction region

Several of the above performance parameters will be realized for the first time at EIC in a collider mode, such as the availability of nuclear beams and polarized nucleon beams along with the operation at high collision luminosity. Shown schematically in Fig. 1.1, the EIC will collide bright, intense counter circulating beams of

electrons and ions and use sophisticated, large detectors to identify specific reactions whose precise measurement can yield previously unattainable insight into the structure of the nucleon and nucleus. The EIC will open a new window into the quantum world of the atomic nucleus and allow physicists access for the first time to key, elusive aspects of nuclear structure in terms of the fundamental quark and gluon constituents. Nuclear processes fuel the universe. Past research has provided enormous benefit to society in terms of medicine, energy and other ap-

plications. Particle accelerators and related technologies play a key role in the discovery sciences and it is estimated that about 30,000 worldwide are operating in industry. The EIC will probe the frontiers of nuclear science well into the twenty-first century using one of the world's most sophisticated particle accelerators and large detectors that will utilize cutting-edge technology.

The realization of the EIC is led jointly by Brookhaven National Laboratory and Thomas Jefferson National Accelerator Facility at Newport News, Virginia. It will involve physicists and engineers from other laboratories and universities in the U.S. and from around the world. This realization is expected to roughly take a decade, with beam operations to start in the early 2030s.

The EIC Users Group (EICUG, www.eicug.org) was founded in 2016. It now contains over 1200 members from 245 institutions located in 33 countries around the world. Late in 2019, the EICUG decided to organize an intensive, year-long consideration of the EIC physics measurements and scientific equipment by the members of the user group. This Yellow Report (YR) summarizes these studies and the conclusions that have been reached. The purpose of the Yellow Report Initiative is to advance the state and detail of the documented community physics studies (EIC White Paper, Institute for Nuclear Theory program proceedings) and detector concepts (Detector and R&D Handbook) in preparation for the realization of the EIC. The effort aims to provide the basis for further development of concepts for experimental equipment best suited for science needs, including complementarity of two detectors towards future Technical Design Reports. It is expected that this YR will be the cornerstone on which detector proposals will be developed by user collaborations beginning in 2021.

The work reported on here was organized by the EICUG at an in-person meeting in December 12-13, 2019 at the Massachusetts Institute of Technology, Cambridge, Massachusetts and was structured around four subsequent meetings in 2020: March 19-21, 2020 at Temple University, Philadelphia; May 20-22, 2020 at University of Pavia, Pavia, Italy; September 16-18, 2020 at the Catholic University of America, Washington, DC and November 19-21, 2020 at the University of California, Berkeley. This was a massive, international, sustained effort through the year 2020 and was overseen by 8 conveners and 41 sub-conveners. Because of the restrictions due to the pandemic, all of the EICUG meetings and interactions in 2020 were carried out remotely.

The EIC will be one of the largest and most sophisticated new accelerator projects worldwide in the next few decades, and the only planned for construction in the United States. It will address profound open questions in the fundamental structure of matter and attract new generations of young people into the pursuit of careers in science and technology. Its high design luminosity and highly polarized beams are beyond state-of-the-art and its realization will likewise push the frontiers of particle accelerator science and technology.

Chapter 2

Physics Measurements and Requirements

2.1 Introduction

The Electron-Ion Collider (EIC) will address some of the most fundamental questions in science regarding the visible world, including the origin of the nucleon mass, the nucleon spin, and the emergent properties of a dense system of gluons. The science program has been reviewed by the National Academy of Sciences (NAS) which concluded that “the EIC science is compelling, fundamental, and timely.” [1]. The NAS review was based on a series of workshops hosted by the Institute of Nuclear Theory (INT) culminating in a whitepaper in 2012 and an update in 2014 entitled “Understanding the glue that binds us all” [2]. The desire and need to construct a new collider facility were prominently featured in the 2015 US Long-Range Plan for Nuclear Science [3].

In this executive section, we present a selection of crucial physics topics that led to the recommendation for the construction of an EIC, and summarize the machine parameters and detector requirements needed to address them.

Key science questions that the EIC will address are:

- How do the nucleonic properties such as mass and spin emerge from partons and their underlying interactions?
- How are partons inside the nucleon distributed in both momentum and position space?
- How do color-charged quarks and gluons, and jets, interact with a nuclear medium? How do the confined hadronic states emerge from these quarks and gluons? How do the quark-gluon interactions create nuclear binding?
