Prospects and Applications for Plant-Associated Microbes

A laboratory manual

Part B: Fungi

Edited by Anna Maria Pirttilä and Seppo Sorvari
Main cover photo, taken by Anna Maria Pirttilä, presents bog bilberry (*Vaccinium uliginosum* L.). The picture was taken on a midsummer day in Lapland, Enontekiö, Finland, in June 2006. The sand dunes of Kalmakaltio in the subarctic Enontekiö are famous for their beauty, having patches of bog bilberry, lingonberry, crowberry, juniper, lichen and grasses dispersed between the dunes.

We wish to acknowledge funding by the Academy of Finland for Dr. Pirttilä (Academy Research Fellow, project no. 113607).

Plants possess a generally sessile lifestyle and therefore they have to receive nutrition, to suffer the seasonal effects, and to survive pathogenic attacks continually at the same stand. This stationary whereabouts of plants has caused pressure to create different strategies to survive. One such way is through collaboration at various levels with other mobile organisms.

In plants, the first reports of microbial symbiosis were made at the end of the 19th century when mycorrhizae and rhizobia were found in association with plant roots. Mycorrhizae are today the best studied plant-associated fungi, but not the only ones. Plants have numerous endophytic infections in every tissue, some being more systemic in nature, and others very localized. Endophytic fungi can be transferred to the next generation in the seeds, which is referred to as vertical transmission, whereas transmission by wind or water is called horizontal. “Endophytic continuum” describes the range of the interactions being from that of latent pathogens to mutualistic symbionts. Plant-associated fungi increase plant growth and resistance towards abiotic and biotic stresses. They can affect plant disease resistance directly by acting as nematophagous fungi or mycoparasites, or by producing antagonistic compounds towards pathogens, and indirectly by inducing plant defense. The richness of secondary metabolites produced by endophytic fungi is overwhelming, and they are considered one of the most promising sources of new drug compounds.

Studying plant-microbe interactions can be challenging as two organisms are involved. Localizing the fungi in plant tissue, analyzing the community structure of unculturable strains, studying the gene expression during host infection, or cues leading to activation of secondary metabolism require specific knowledge and skills. Isolation, culturing, and screening of endophytic fungi for bioactive compounds can be fruitful, if experience-driven information on the growth conditions and secondary metabolite production, as well as tests for bioactivity are provided. This book guides the reader in the word of plant-associated fungi, giving both theoretical and practical insight on the potential of this interaction in biotechnology. Detailed instructions and step-by-step protocols are described for isolation, identification, localization and community analysis of fungi, studies on their bioactivity, molecular plant-fungal interactions, and development of fungi as tools for biotechnology.

We thank all colleagues and friends who selflessly expended their valuable time to contribute to this volume.

### CONTENTS

#### EXPERIMENTAL CHAPTERS

**ECOLOGY**

**Isolation and identification**

- Dilution-to-extinction cultivation of endophytic fungi and isolation and detection of grass endophytic fungi in different plant parts
  - Mónica S. Torres, Mariusz Tadych, James F. White, Jr. and Gerald F. Bills
  - Page 13

- Studies on communities of endophytic (end) and ectomycorrhizal (ecm) fungi associated with oaks in pure and mixed stands
  - Salvatore Moricca, Antonio Franceschini, Alessandro Ragazzi, Benedetto Teodoro Linaldeddu and Enrico Lancellotti
  - Page 19

- Isolation of fungal root endophytes, molecular screening, and testing of Koch’s Postulates
  - Ari Jumpponen, Stacie Kageyama and Keerthi Mandyam
  - Page 28

**Community analysis**

- Endophytic fungal communities in plant roots studied by cultivation-independent methods
  - Flavia Dematheis and Kornelia Smalla
  - Page 34

- Extraction, amplification and sequencing of fungal DNA from uncultured ectomycorrhizas
  - Daniel M. Durall
  - Page 44

**Fungal viruses**

- Purification and sequencing of viral double stranded RNA (dsRNA) from mycelium
  - Noemí Herrero, Encarna Dueñas and Íñigo Zabalgoetzcoa
  - Page 47

**INTERACTION WITH THE HOST**

**Colonization of plants**

- Detection of uncultured seed-borne endophytes in *Atriplex canesens*
  - Mary E. Lucero
  - Page 53

- Localization of endophytic fungi in plant tissue by in situ hybridization
  - Anna Maria Pirtiliä
  - Page 60

- Manipulation of *Epichlœ/Neotyphodium*-endophyte infection in grasses: elimination of endophytes by heat treatment from seeds and inoculation of seedlings with endophyte hyphae
  - Piippa R. Wäli, Marjo Helander and Kari Saikkonen
  - Page 64
Molecular interactions

Altering symbiotic lifestyles by genomic mutation
Rusty J Rodriguez, Stanley Freeman and Regina S. Redman

Microarray analysis of gene expression of endophytes
Janne J. Koskimäki and Anna Maria Pirttilä

Chemogenomic analysis of fungal stress-response systems using phytochemicals
Jong H. Kim and Bruce C. Campbell

BIOACTIVITY

Screening for bioactive strains

Isolation of endophytic fungi for the production of biologically active secondary metabolites
Barbara Schulz, Karsten Krohn, Kathrin Meier and Siegfried Draeger

Screening assays for antibacterials and antioxidants from endophytic fungi
Mysore V. Tejesvi and Anna Maria Pirttilä

Isolation and identification of endophytic fungi and evaluation of antifungal activities against various plant pathogens
Jin-Cheol Kim, Gyung Ja Choi and Myung Soo Park

Isolation of bioactive compounds

Isolation of metabolites from the fungal culture media
Karsten Krohn and Barbara Schulz

BIOTECHNOLOGY

Growth promotion

Inoculation of arbuscular mycorrhizal fungi with micropropagated plants during acclimatization
Matthias Döring and Carolin Schneider

Morphometric and biochemical analysis of plant roots
Marco Mucciarelli and Anna Fusconi

Biocontrol of diseases

Isolation and selection of fungal endophytes for the suppression of soil-borne diseases
Kazuhiko Narisawa and Ousmane Diene
**Detection and genetic modification of biocontrol strains**
